Readers of the ELECTRICAL REVIEW were recently asked to bear in mind, when inquiring for delivery, that Government orders were obliged to have preference in the factories, and that patience should be exercised in a more than usual degree when manufacturers were tardy in delivery. This request was, as Euclid says, "self-evident, and required no proof." At the same time, for the information of some, it may be well to enlarge upon the three points already mentioned in this connection, to indicate generally the conditions under which factories are running to-day, and the troubles of the manufacturer. Naturally, these three items form the same

difficulties for factories generally, the only modifications being that for different industries and localities, the most acute problem is not the same, but varies according to circumstances.

according to circumstances.

Labour was none too plentiful before August, 1914, and Government requirements (in the case of which the writer has experience) necessitated both extra plant and a partial double shift. Machine hands, unlike poets, are not born but made, and the required number had to be trained in as short a time as might be. The arrival of new machinery and its installation saw the establishment of a night shift, with the inevitable division of the available men-This was only done at the expense of a stoppage of other machinery for periods of a few days, and no little ingenuity was wanted to make things fit-Eligible workers enlisted or were called up to join their Reserve or Territorial units, and older workers were absorbed from industries upon which the war has fallen as a blight. The old business adage of modern rush, "too old at forty," has gone by the board. The age limit for engaging workers, if it has not vanished in toto, is at least twice the figure of pre-war days, employers' liability and other obstacles notwithstanding. The gaps in the ranks of men have so far as practicable been filled up by girls. A forty-eight hour week has, for the bulk of the machinery, mysteriously expanded into about two-and-a-half times its normal term. The works staff remains as before: yet the amount of supervision is more than doubled. The percentage of sick has increased, and the cause is not drink. hours and night work have claimed their toll in the works "casualty" list. The new order of things is now on trial, and time will show its efficiency. So far as labour is concerned, the emergency has been met and tackled, as engineers say, with a fair measure of success. The maximum output, if not now achieved, should be only a matter of a short time. Whether the new machinery will always be running 21½ hours per day is another matter, depending upon a rather large number of problematical "ifs." That is our risk.

The supply of raw material has been, and still is, an undertaking of somewhat precarious nature, as uncertain as the weather. One firm's raw material is another firm's finished article. Concurrently with the sudden jump in the demand there has come in some materials a serious check in the continuity of supply, and sometimes even in the quantity there has been a deficit. Copper and lead are obtainable in spasms, and the arrival of these metals again depends upon another series of "ifs." Among these are: if the ship were not commandeered by the War Office or Admiralty en route; if it were not torpedoed by the enemy; if it could be unloaded when docked. Actually, one boat was so commandeered, and ran about the world with copper in her hold until she was released and able to come home and unload her cargo. Another was dry-docked with copper aboard which could not be unloaded owing to dock-labour Other goods were only to be bought in comparatively small quantities, and for delivery at such dates as would only allow a hand-to-mouth sort of existence in the shops where they are used. Matters have certainly improved of late, and suppliers are working strenuously to cope with the abnormal demand, but even now assurance is lacking that one material or another will not suddenly run dry, and temporarily put out of commission this or that de-Further, when one must earmark, for partment. Government orders only, the whole supplies of a particular commodity or some special size or class of raw material, it is not easy to see where the ordinary customer comes in. This has been done in certain sections of electrical engineering, and is still being Then the question of the apportioning of the becomes a little more clear. The old story output becomes a little more clear. The old story of the three essentials to success: First, audacity; second, audacity; and third, audacity; is adapted to

war requirements, and it is "war urgency" every time. The other people are the regular old-standing customers, and new-comers, some of whom (whisper it) have always previously bought from Germany. There should be no doubt as to which of these obtains priority after His Majesty's orders are filled. The sum total, however, amounts to a deal of work, and even with overtime and double shifts it is not easy to arrange for anything even approaching strict rotation of manufacture. Especially is this the case with small orders and stock lines, which, in the ordinary course of events, are turned out promptly. Stocks run out, and in the general pressure are quite a time in their renewal. An extra quantity of sweet reasonableness is therefore needed on the part of buyers who cannot get their stuff delivered. Things are bad no doubt, but the shop is open on this side of the English Channel, but what of the other side? There are many who do not complain overmuch, and there are the others. One gentleman writes: "Work overtime if necessary," as though to offer us the "open sesame" for a quick dispatch of his requirements. Another says: "This order was placed on a rush basis"; he apparently forgets that there are others on the same basis for the battlefield or the submarine. However, these small touches add to the gaiety of nations. Other orders come in with a penalty clause attached, and some of these from our Colonial Governments. One wonders what would happen if one of these penalty lots were torpedoed on its way to the Antipodes. To penalise manufacturers in penalty in instificial but the period of the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the second to the turers in peace-time is justifiable, but the war has lasted long enough for the penalty clause to have been jettisoned long before now, and it is questionable whether a penalty could be enforced at present, even though the order had been booked during the term of the war.

From this bald statement of the case one may, to some extent, appreciate the accumulation of troubles under which factories have been working for the past few months. Orders can be dealt with subject to the conditions indicated and to the limitations involved. Nobody can pretend to anticipate the extent of Government requirements or the time of Government demands. It is on this account nearly impossible to promise with any degree of accuracy the time required to execute other orders, and bearing this in mind one will doubtless lend the toleration asked for in the Review article to which reference has already been made.

#### GOOD LIGHTING AND ITS EFFECTS.

#### By V. H. MACKINNEY.

(Abstract of paper read before the Yorkshire Local Section of the Institution of Electrical Engineers at Bradford, April 14th, 1915.)

It is somewhat singular, seeing that so much care is devoted to the natural lighting of buildings, that the provision of artificial light does not receive more care. Not infrequently when buildings are erected the artificial lighting is left to the very last, and the amount expended on it is quite out of proportion to its importance. Yet in the present age artificial light plays an important part. Much of the labour of to-day is done by artificial light; most people find in the evenings their main opportunity for social enjoyment and recreation. During recent years educational authorities have been making special efforts to better the lighting of schools.

Bad lighting, by adding to the strain of labour, causes fatigue and general deterioration in health, even when it does not directly affect the eyes; it is also directly responsible for a large number of accidents. Accidents are always a source of loss, not only because of the compensation paid to the injured, but also because of the disorganisation to which they give rise. It has been proved that unsatisfactory lighting is often a cause of spoiled work, and that it slows down the speed of operators and limits the output. In a certain factory tests were recently made before and after an improvement in the lighting, and it was found that the output had been increased by 11 per

cent. The cost of lighting is almost always a minute fraction of the wages bill—in many industries less than 1 per cent.—so that even a small increase in output would more than repay the relatively small cost of putting the lighting on a satisfactory basis. The finer the quality of the work, and the more skilled the operators, the more serious are the results of poor illumination. In the textile factories of the North the weavers migrate to those mills that are known to be well lighted, and desert those where the illumination is notoriously bad; they know that they can earn more when the illumination is satisfactory. A clerk working in insufficient light is apt to make mistakes, and no one can foresee how serious the consequences of such a slip may be. Show-window lighting has become a fine art, and up-to-date merchants fully recognise the value of well-lighted windows as an advertisement.

It is not such an easy matter to say exactly of what good lighting consists; only long experience can show exactly how much light is needed for different classes of work, and only the shill of the trained lighting expert can secure that in any installation this correct amount will be provided. Another fundamental rule is that the light should be directed where it is needed. Proper shading is one of the first requisites in successful illumination. The reflection of surroundings plays an important part in the resultant illumination, and it is quite possible to obtain an increase of as much as 80 per cent. over the calculated values due to reflection from the walls and ceiling, if the room is within reasonable size and the surroundings are light in character. The following table indicates the amount of assistance one may expect from different surroundings:—

Condition of ceiting.	Condition of walls.	Increase over calculated illumination.				
·Very dark	Very dark	0 %				
Medium	Very dark	15 %				
Medium	Medium	40 %				
Very light	Very dark	30 %				
Very light	Medium	<b>5</b> 5 %				
Very light	Very light	80 %				

The following average foot-candle intensities are recommended for the various classes of service indicated:—

The minimum illumination at any point should not be less than half the values stated above. To calculate the foot-candle illumination one must have full particulars as to the polar distribution of the light source he is going to use, also the actual candle-power emitted by the source in the different zoner. With the advent of different forms of filament winding and different efficiencies of lamps, the present rating is becoming invufficient. The most ideal method seems to be the rating of lamps in quantity of light emitted, i.e., lumens—a lumen being equal to 0'0796 spherical candles; but the most understandable rating would be in mean spherical candle-power. The mean spherical candle-power may then be considered as a measure of the total flux of light, M.S.C.P. × 4 = total lumens emitted, and thus one source would be directly comparable with another. The source rarely gives exactly

the distribution of light required for a specific problem, and it is almost always necessary to use it with a suitable reflector. [The lecturer showed polar curves which indicated how the bare lamp distribution could be altered, and how great were the advantages to be derived by using a suitable reflector.] With white glass one can only obtain a general distribution; with mirrored reflectors only concentrated distribution, and with prismatic reflectors, properly designed, any obtained. With properly concentrating to extensive one be obtained. mand reflectors, properly designed, any distribution from extremely concentrating to extensive can be obtained. With enclosing glass-ware one has a very similar set of conditions. A frosted globe, which has only diffracting properties, leaves the distribution curve of the illuminant essentially unchanged, and merely smoothes it out by averaging the light-flux over a narrow range of angles. An opal or white glass globe, which is an excellent diffuser, entirely phonore the distribution to the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the conte An opal or white glass globe, which is an excellent diffuser, entirely changes the distribution curve by substituting the diffusing globe as secondary radiator, and retains only for a small portion of the light the original distribution. A lamp in an opal globe, not too dense, is, therefore, clearly but faintly visible, surrounded by a brightly luminous globe. In the case of a frosted globs the lamp appears as a bright ball of light, while its outline is not visible; the globe being non-luminous or but faintly luminous. With price that globes it is possible to obtain both good diffusion and rematic globes it is possible to obtain both good diffusion and redirection of the light rays. Clear glass with correctly designed prisms affords a means of controlling light to the greatest extent and redirecting it more efficiently than any other known material material.

[The lecturer then showed a curve obtained from an enclosed prismatic unit in conjunction with a 400-c.p. half-watt lamp.] The unit is specially designed for street lighting and gives the maximum illumination—two and a half times the rated candle-power of the -at an angle of 15° from the horizontal, which is considered ideal for the purpose. The particular unit from which the curve was obtained is made up of two pieces of prismatic glassware, one fixed inside the other. The internal piece has a smooth interior and horizontal prisms on the exterior, and the external piece has a smooth exterior and vertical ribbings on the interior. This, when fixed together, offers both a smooth interior and exterior, which does away with the objection as a dirt collector of pris-matic glassware when used in the open.

The following simple rules for good lighting should be observed:

—Don't work in a flakering light; don't expose the eyes to unshaded lights in the direct range of vision; don't judge illumination by the brightness of the lamps; avoid excessive contrasts; use the right type of globe, shade or reflector; make sure that the illumination is sufficient; keep lamps, globes and leflectors clean; and make sure that the lamps are in the right positions.

#### DISCUSSION.

MR. WILSON HARTNELL said that in a theatre or ballroom overhead lighting was required, in order that people could see what was going on around them, whereas in dining-rooms and drawing offices persons did not want to look around them, but desired to have the light directed on to what they were doing. In a drawing-room also subdued light was very pleasant, especially if persons met simply for conversational purposes. They should always ask themselves when putting in a lighting installation: "What result do you wish to obtain?" and then act accordingly.

MR. BROWN said that several times he had tried to demonstrate to people that Holophane shades were the best for their purposes, but the cost of the shades killed any arguments that could be put forward in their favour. When they came to put the thing into actual practice it was not quite so easy as it appeared on paper or on a diagram—a great many of the apparent advantages would have to be discounted when one was trying to convert people in regard

to be discounted when one was trying to convert people in regard

MR. Moss said he had had similar experience to Mr. Brown. He had gone to considerable expense and trouble at times in demonstrating Holophane lighting in mills as compared with lighting by ordinary shades, and he had always run up against the one difficulty—cost. At the same time, he thought it was quite possible to get very satisfactory results with a good glass or white opal shade. Shops to-day had to be attractive, and there was no doubt that lighting was one of the principal things a shopkeeper had to consider.

PROF. G. F. CHARNOCK said his experience of lighting in the drawing office or classroom was in favour of indirect lighting. He had laid down a sort of standard some time ago, that from the lighting in a drawing office one should be able to read one-hundredth of an inch on a steel rule. Unless the light was very good indeed he did not think many would be able to do that, but he found with indirect lighting that it was perfectly easy, although when they entered the room they would not be impressed with the when they entered the room they would not be impressed with the abundance of light. Well diffused lighting was wanted in a drawing office. If they used the deek-light standards they ran the risk of injuring the eyes, because one occasionally found it necessary to turn round for some reason or other, and the very great change from the bright light to the dark corners of the room was likely to prove objectionable. With regard to Holophane shades, if properly arranged they were well worth the extra cost. With some modern theories with record to lighting buildings there. with some modern theories with regard to lighting buildings there was a tendency to run in the direction of too great economy, and rooms of buildings, halls and oburches which were reputedly well lighted according to modern notions were, when one came to examine them closely, somewhat disappointing. If a man could not read his hymn book in church the lighting was not sufficient, and all the very beautiful effects on the ceiling and on the archer, and on the carving, and so on, were really of secondary importance. He would like to caution those present against taking too much

notice of photographs, because, as an amateur photographer, he could assure them that with a little trickery in exposure and development they could get any result they desired. He did not regard the photographs which the lecturer had shown as satisfactory proof in regard to the installations concerned, and he thought it well to throw out a word of caution.

MR. WRIGHT said the lecturer had told them nothing about overlighting. He knew an arcade—lighted by gas he believed—into which it was positively injurious to the eyes for a person to enter. Proper shading ought to be adopted to diffuse the lighting. He agreed with Prof. Charnock with regard to the lighting of drawing offices. He was sure that his cycsight had suffered in his drawing-office days through the necessity of using a strong and concentrated light. concentrated light,

MB. COLLINSON said that the diagrams which they had seen with regard to the metal-filament lamps largely went to show that the present shape of lamp was not altogether satisfactory, and it would rather appear that in the next year or two that type of lamp would be gradually eliminated, and another lamp put on the market which would give a better downward distribution of light. market which would give a better downward distribution of light. He under-tood the lecturer to hold the opinion that prismatic glass was the thing to use in connection with electric lighting. His own experience of prismatic glass was that when it was new and clean it was very good, but after it had been installed for a while and was covered with dust it seemed to lose a good deal of its efficiency. Dirty shades were ineffective, and although they could put on a good shade, unless they kept it clean they would not get the effects they should have.

The CHAIBMAN (Mr. T. Roles) said that personally he thought for dwelling houses shades of alabaster or special glass were much more pleasing in appearance than Holophane shades, whereas for business premises Holophane shades were, as a rule, found to be excellent. He agreed with Prof. Charnook with regard to the injurious effect of strong light on the eyes of draughtsmen, clerks and others who worked at desks, and thought that in every room it was necessary that there should be a soheme of general illumination so that one would not look from the strong light to practically no light at all. In the Bradford Town Hall it had been suggested, and, he believed, carried out in the majority of the offices, that the lighting should be immediately over the desks. In the electricity offices, however, he strongly opposed this form of illumination, and the draughtsmen and clerks supported him—they much preferred a diffused light which was practically shadow-less. In regard to street lighting, and indeed, lighting generally, he believed it would take a number of years before they could convince the public that good lighting lay in good distribution rather than in having great fiares of light in different parts.

The lecturer briefly replied to the points raised in the discussion. much more pleasing in appearance than Holophane shades, whereas

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### Electrically-Operated Carriage-Drive Gates.

The ornamental value of handsome gates at the entrance to a carriage drive is often lost upon those who have occasion to pathrough them, owing to the necessity for descending from the wehicle to open or close the gates in the absence of the lodge-keeper. The electrical way of surmounting this difficulty is exemplified at a country house in the North of England, where a exempined at a country house in the North of England, where a fine pair of gates, with imposing pillar supports gracing the approach to the hall, is electrically operated. The operating gear consists of a ½-H.P. Witton motor, geared through a clutch to a mechanism for opening and closing the gates. The electric motor and mechanism are housed in a small tunnel underneath the gates, a small manhole situated on one side giving access to them. a small manhole situated on one side giving access to them. Power is supplied from the house installation. The controlling switch, which is located in the garage, is of the reversing type, so that putting the switch in one position closes the gates, and putting it in another position opens them. On completing the circuit the motor is started up, and a solenoid circuit energised, connecting the motor to the gate-opening mechanism through the clutch. The presence of this clutch, which is open when the motor is not at work, enables the gates to be opened or closed by hand when desired. Before leaving the garage the chauffeur opens the gates, and after driving through, he signals by means of opens the gates, and after driving through, he signals by means of the horn to anyone who happens to be in the garage, should he desire the gates to be closed immediately. On the other hand when the gates are found closed on the return journey the sound of the horn gives the signal for the switch to be put to the opening position. It is estimated that the gates can be opened over 500 times at a cost of 1d. for energy. The scheme could be arranged so that by means of a time switch the gates were closed some few minutes after the departure of the car from the garage; moreover, they could be controlled by means of a push button in the hall of the house, or by a mechanism completing the electrical circuit due to the weight of the car pressing on it as the car reached the

gater.

The gates were constructed by Messrs, Lockerbie & Wilkinson,

The gates were constructed by Messrs, Lockerbie & Wilkinson, Tipton, Staffs., and the operating mechanism by the Witton-Kramer Electric Tool and Hoist Co., Witton, Birmingham, for whom the GENEBAL ELECTRIC Co., LTD., of 67, Queen Victoria Street, E.C., are the sole selling sgents.

#### Electrically-Driven Cloth Printing Machine.

An interesting example of the electric drive as applied to the printing industry is shown in the accompanying illustration. The machine is a six-colour cloth printing machine arranged to print squares or rectangles, with side and cross borders in any length from 1 yard to 10 yards, increasing by 1 in., and using rollers 18 in. in circumference. The machine is driven by a 25 H.P. three-phase Witton motor, the controller resistance being mounted on the bedplate of the machine. As will be observed, the motor is completely out of the way, and the illustration gives a designs, both having swivel and trunnion mounting, which permits the movement of the fan horizontally or vertically through a wide angle. The ease of conversion from bracket to deak type is an attractive feature.

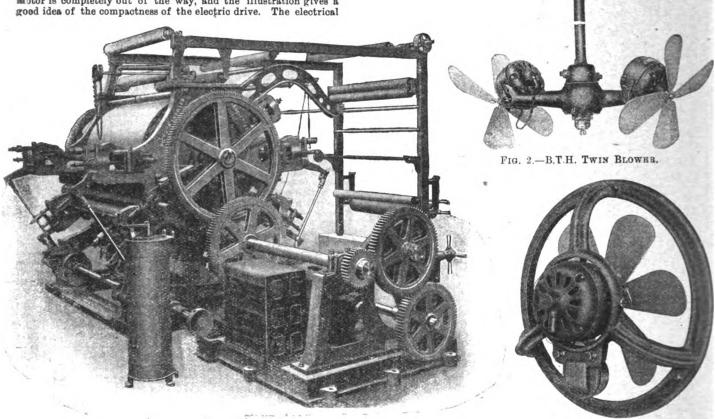

FIG. 1.—SIX COLOUR CLOTH PRINTING MACHINE DRIVEN BY A WITTON MOTOR.

FIG. 3.—B.T.H. EXHAUST FAM.

equipment was supplied by the GENERAL ELECTRIC Co., LTD., of Witton, Birmingham, and 67, Queen Victoria Street, London, E.C.

#### The Naylorgraph.

Tast week a demonstration was held in London of a new type of electric sign, known as the "Naylorgraph," which is being constructed by MESSES. NAYLORGRAPH, LTD., of 240, High Holborn, London, under patents granted to Mr. J. P. Naylor.

This sign differs from the numerous types of signs displaying

words and set phrases, with which our readers are familiar, in that within its letter capacity it can be made to display any desired message, practically on the spur of the moment; moreover, its construction is such that the legend is visible by day or night.

The High Holborn sign, fig. 4, which is situated in a position commanding a considerable length of this thorough fare, has an area

of 400 sq. ft., measuring 33 ft. long by 12 ft. high; it consists of 52 monograms in four lines of 13; each monogram has 23 elements or units which can be grouped to form a letter.

The elements are of special design, consisting of a white disk-like member provided with two black metallic covers or eyelids, which are rotated by electro-magnetic means to uncover the disk behind each disk is a lamp for night illumination, also controlled in a similar manner. The 1,196 elements comprising the sign are coupled up to a single keyboard, which is selectively placed in relation with each monogram so as to cause the display of any letter upon any panel, an auxiliary board being provided to delete or cause non-display of any desired monogram. This keyboard was primarily designed for the display of news, and by its means an average of one change a minute can be obtained on the sign.

The output designer are appreciated and constitution against set that

The control devices are connected and operated in series, so that they can be connected directly to a 200-volt DC, supply. It may

be pointed out that the elements are self-contained units provided with a short flexible and plug, which are easily replaceable.

The sign was utilised for recruiting purposes during the week, with considerable success, and its versatility undoubtedly formed an attractive feature.

Messrs. Naylorgraph have been granted patents in over thirty countries, and their letter design and monogram are registered; we understand that they are prepared to negotiate for the exploitation of their foreign patents.

### B.T.H. Electric Fans.

A recent list (No. 7,100-B) issued by the BRITISH THOMSON-HOUSTON Co., LTD., of Ragby, gives particulars of a number of types of electric fans and fan motors made by the firm. Particular stress is laid on the desk and bracket types of fan, which are built for either direct or alternating-current working, with 12-in. or 16-in. diameter fans, and are built in oscillating and non-oscillating

The oscillatory movement is provided by positive mechanism, and does not depend on air reaction.

The motor and fan can be made to oscillate through a pre-determined angle. The list also shows ceiling type fans, one of which, a twin blower, we illustrate in fig. 2; we also illustrate an

FIG. 4.—THE NAYLORGRAPH DAY AND NIGHT SIGN.

exhaust fan, fig. 3, these being built in 13-in. and 16-in. sizes for either direct or alternating-current working, and provided with a separate speed regulator.

#### Electric Lighting of Ambulance Trains in France.

The electric lighting of ambulance trains for use on the Continent has presented some features of special interest, the running conditions being particularly exacting. Trains consisting of pharmacy and ward coaches have been built in this country by the Great Eastern Rullway, the Great Western Rullway, the London and North-Western Rullway, and the London, Brighton & South Coast Rullway, while several coaches have, at the order of the Red Cross Spriety, been supplied by the Birmingham Rullway Carriage and Wagon Co.

These various units have been equipped throughout with Stone's system of electric train lighting, which has been adapted for service on craches working to no fixed time-table and subject to long periods of standing and slow running. To meet the exceptional requirements of the case, use has been made of special dynamos, which are capable of doing the requisite current generation at a speed of but little more than 10 miles an hour. These machines are of the latest type, and are fitted with ball bearings.

The supply is at 24 volts.

The lamp circuits are divided into two sections, so that either half lights or full lights can be used at will; moreover, individual control is provided on most of the lamps. Wall sockets also are fitted in several coaches, to facilitate the employment of portable

The accumulators installed consist of double batteries of Stone's standard "Tonum" cells, and these give a "full lights" capacity of over 48 hours. It is unlikely, however, that all the lamps will be used at one time, hence the available storage is very great. With batteries of so large a rating and dynamos generating current

with district of a large at the installations are capable of satisfactory working, even under the most trying conditions.

The whole of the apparatus is of British manufacture, being supplied by MESSES. J. STONE & CO., LTD., of Deptford, London,

### LEGAL.

UNDERWOOD v. BRITISH URALITE CO.

This case was, on Thursday, April 22nd, the subject of an appeal by the defendants to the Divisional Court of King's Bench, before ustices Bailhache and Shearman, from a verdict and judgment in the action of Underwood v. The British Uralite Co., heard in January last by Judge Rentoul, in the City of London Court, when a jury awarded the plaintiff £71 damages for breach of contract. The matter was fully reported in our issue of February 5th, page

COUNSEL for the appellants argued that the defendants had not entered into any contract with the plaintiff by which they were precluded from selling to Messrs. Kynock, and that there was no custom with regard to dealers which prevented them from dealing direct after the plaintiff had failed to purchase within the period of the option, there being no concluded contract of sale between plaintiff and Martin or between Martin and Kynocks.

MR JUSTICE BAILHACHE, after hearing lengthy arguments on both sides. said he was of opinion that the work done by plaintiff was not for the defendants, but in order that he himself might effect a sale. There was no implied contract to pay for services was not for the defendants, but in order that he himself might effect a sale. There was no implied contract to pay for services so rendered. What was done was done by the plaintiff because he was a person who had an option of purchase and was trying to find a purchaser from himself. He did not think the circumstances of the case supported the arguments of the plaintiff. If it were so, the defendants could not dispose of their machinery without a liability to pay the dealer for services rendered. The Judge in the Court below had wrongly directed the jury on that point. The other point put to the jury was that there was a custom that where a person had machinery to sell, and he went to a dealer and offered it to him for sale, and that dealer brought people to see it, the owner might not afterwards deal with the person whom the dealer had so brought. He wards deal with the person whom the dealer had so brought. He did not agree with such a contention, and the evidence was not sufficient to support it or to establish the existence of a custom.

The appeal must, therefore, be allowed.

MR JUSTICE SHEARMAN gave judgment to a similar effect, observing that Mesars. Kynock had not gone behind the dealer to make their purchase, and there were no circumstances put before the jury to show that there was any liability to pay plaintiff for

The appeal was allowed, and judgment entered for the defendants, with costs.

On the application of Mr. Doughty, appearing for the plaintiff, a stay of execution was granted with a view to appeal.

OSRAM LAMP WORKS, LTD., v. SCEANDO LAMP Co., LTD.

MR. WALTER, K.C., mentioned, on April 23rd, to Mr. Justice Younger in the Chancery Division, a motion in this action for an interim injunction to restrain, until the trial, an alleged passing-off by the defendants.

Evidence, he said, had been filed on both sides, and the conflict was such that he could not usefully ask his Lordship to deal with the matter upon affidavit evidence. He had agreed with the other side therefore that there should be no order on the motion except that the costs should be costs in the action.

His LORDSHIP assented to that course being adopted.

ALLEGED INFRINGEMENT OF A PATENT VACUUM CLEANER.

In the House of Lords on April 19th, 23rd and 26th, arguments were heard in an appeal by the British Vacuum Cleaner Cc., Ltd., against an order of the Court of Appeal in favour of the respondents, James Robertshaw & Sons, Ltd.

The House consisted of the Lord Chancellor and Lords Strathelyde, Parker, Sumner, Parmoor and Wrenbury.

The action was brought by the appellants to obtain an injunction to restrain the respondents from infringing the appellants' letters patent No. 17.433 of 1901, granted to Hubert Cecil Booth for an invention entitled "Improvements relating to the extraction of dust from carpets and other materials," and for an inquiry as to dust from carpets and other materials," and for an inquiry as to damages and other relief. The specification stated that it was essential for practical success to drive by power the pump employed for producing a vacuum, and to maintain a vacuum of at least 5 lb. per sq. in. in the filter on the side of the filtering medium where the air and dust entered, when the apparatus was at work, and that it was only to extractors working with a considerable vacuum that the claims related. The first claim was for the combination of an extracting implement connected with a power-driven suction of an extracting implement connected with a power-driven suction pump and dust-collecting means interposed between the said implement and pump, substantially as and for the purpose specified. The patent had been held by the House of Lords in a previous action to have subject matter and to be valid. The plaintiffs complained of threats and of actual infringement by the defendants' mechanics, which had entring hellows instead of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state of a state o cover suction bellows although worked by motor, and (2) that the machine complained of did not work at substantially 5 lb. vacuum. Mr. Justice Sargant decided in favour of the plaintiffs, vacuum. Mr. Justice Sargant decided in favour of the piaintins, but the Court of Appeal by a majority (the Master of the Rolls and Lord Justice Swinfen Eady—Lord Justice Phillimore dissenting) considered that the term "a power-driven pump" could not be applied to a power-driven bellows, and that the defendants had done no more than apply power to the old Harvey machine. Lord Justice Phillimore considered that the essence of the plaintiffs' invention as regarded the power-driven pump, was "the produc-Justice Phillimore considered that the essence of the plaintiffs' invention, as regarded the power-driven pump, was "the produce a contion by mechanical power of a suction such as will produce a considerable vacuum sufficient to extract the dust from and through the carpet, the extractor being a close fit." Accordingly, by the majority judgment of the Court of Appeal, it was held, notwithstanding the prior user of the machine of Harvey, that the patent was, on the construction placed on the specification by the House of Lyde walld, but that the defendants had not infringed, and of L rds, valid; but that the defendants had not infringed, and the appeal was allowed. The plaintiffs now appealed against that judgment.

Mr. Thomas Terrell, K.C., Mr. Colefax, K.C., and Mr. Courtney Terrell appeared in support of the appeal; Mr. Walter, K.C., and Mr. Gray for the respondents.

On the hearing of the appeal the respondents were not heard, and judgment was reserved.

#### ARMORDUCT MANUFACTURING Co., LTD., v. ABMITAGE.

In the City of London Court, on Monday, before his Honour Judge Rentoul, K.C., an action was brought by the plaintiff against Mr. T. Armitage, electrical goods dealer, John Street, Hudderefield, for £21 balance of account for Sunbeam electric lamps supplied.

Mr. F. Hinde appeared for the plaintiffs, and Mr. F. H. Bodvano for the defendant.

MB. HINDE said that the defendant admitted owing £8 15a, for which plaintiffs had obtained judgment. As to the balance, £12 5s., there was no dispute about the receipt or acceptance of the lampe.

The matter was gone into in considerable detail, after which judgment was given for the plaintiffs for the amount claimed. with costs.

New Zealand.—The New Zealand Customs authorities have recently given a decision to the effect that "Igniters, electric (for gas or oil engines), are to be classified under No. 385 of the Tariff, a duty of 20 per cent, being imposed on foreign manufactures, while British goods are to be admitted free of data."

A Wellington firm of importers is inquiring for the names of British makers of metal-filament lamps. Application may be made to the Board of Trade C.I. Branch in London,

Women's Work Exhibition.—At a "Women and Their Work" Exhibition, which is being organised by the Daily Express, and which opens to-morrow at the Royal Horticultural Hall, Westminster, for a period of one week, there will be daily demonstrations of electric cooking. On May 4th, at 3.30 p.m., Miss Mand Lancaster will lecture on "Electricity in the Service of the Home."

#### PARLIAMENTARY.

#### Halifax Corporation Bill.

LORD NEWTON'S Select Committee of the House of Lords commenced the consideration of the Bill promoted by the Halifax Corporation on April 22nd. Under the Bill the Corporation sought powers to construct certain tramways and to provide

Corporation on April 22nd. Under the Bill the Corporation sought powers to construct certain tramways and to provide and run trolley vehicles and motor omnibuses.

Mr. LLOYD, K.C., for the Corporation, explained that the principal tramway project was an extension to Elland, a mile and a half long, and this was opposed by the Huddersfield Corporation and the West Riding County Council. A second project was an extension of the tramway from West Vale to Stainland, and this also was opposed by the County Council. The promoters also wanted power to run motor 'buses along any street in the borough, along two specified routes outside the borough, and on any route which the Board of Trade and the road authority might eventually agree to. They were agreeable to contributing \$\frac{1}{2}d.\text{ per 'bus mile to the expense of maintenance of the roads, which was the sum generally fixed in other cases. Under the Bill they asked for borrowing powers of £110,000 for construction of tramways, £14,000 for tramway rolling stock, £5,100 for trolley vehicles, £26,300 for electrical equipment, £6,000 for an extension of the tramway depôt, and £3,600 for motor omnibuses.

Having heard the evidence the Committee rejected the proposal for the tramway to Elland, and also modified the clause which would have allowed the Corporation to make agreements postponing purchase by outside authorities. Clauses were also inserted to protect Huddersfield and Brighouse against competitive omnibus services from Halifax.

#### South Shields Corporation Bill.

A Select Committee of the House of Lords, presided over by Lord Hylton, after consideration of the South Shields Corporation Bill, has ordered it to be reported for third reading in a medified form. Amongst the proposals contained in the Bill were those for tramway extensions in the Mile End and Sunderland Roads, and for the running of motor 'buses to Boldon Collisions. Boldon Collieries.

Boldon Collieries.

In the evidence it was stated that the Corporation had made an agreement with the Rural District Council with regard to the motor 'bus service and would contribute to the cost of the maintenance of the roads.

No opposition was offered to the tramway proposals, and the only opposition to the motor 'bus service was in respect of the wear of the roads and bridges.

The Committee rejected the motor 'bus proposal and allowed the tramway clauses.

#### WAR ITEMS.

Board of Trade Assistance.—The Board of Trade Commercial Intelligence Branch has issued list No. 17 of inquiries for sources of supply of goods, for the week ended April

mercial Intelligence Braneh has issued list No. 17 of inquiries for sources of supply of goods, for the week ended April 17th.

Manchester Car Collections.—More than £10,000 has been collected for various war relief funds by means of the collecting boxes which have been on all the Manchester tramcars since the commencement of the war.

Glasgow University Engineers' Offer.—At the meeting of the Court of the University of Glasgow, on April 23rd, Principal Sir Donald MacAlister intimated that the whole staff of the engineering department—lecturers, assistants, demonstrators, and workmen in the laboratory—had offered themselves in a body to the military authorities in case their services might be of use in connection with the provision of munitions of war. He had had a letter from the Major-General of the Ordnance Department cordially acknowledging the value of the offer, and stating that in a very short time they would be able to indicate how the services of the staff might be best utilised. In the meantime the Admiralty had asked the University to do a service which they could do in connection with the actual work of providing munitions of war in Glasgow—namely, that they should put their workmen and their testing machines at the disposal of the Admiralty for the purpose of testing specimens of steel used in shell-making in the district. He was quite sure that Professor Cormack would undertake the supervision of this matter so far as providing facilities for the Government was concerned, and he was sure that the Court would cordially accede to the request.

Once Bit, Twice Shy.—Our contemporary "La Lumière Electrique" reproduces a letter which is being circulated by the Syndicate of Engineers, Boilermakers, and Foundrymen of France to all firms engaged in the trades named. After offering official statements on the war in six languages for circulation to foreign clients and agents, the letter points out that the Germans and Austro-Hungarians who were resident in France before the war, whilst ostensibly earning the

cerns are adjured never more to employ Germans or Austrians in any capacity whatever; never to accept the cerns are adjured never more to employ Germans or Austrians in any capacity whatever; never to accept the gratuitous services of young Germans or Austrians who may present themselves as "volunteers"; and not to renew agencies for enemy firms after the war, but to deal in or purchase only apparatus, etc., of French manufacture, or if not made in France, of Allied or neutral origin, the principle being to abstain rigidly, in view of the mentality that has been unmasked, from commercial transactions with the Germans. The Syndicate places its services at the disposal of readers, to furnish them with the names and addresses of French, British, American or other firms that make apparatus such as they have been accustomed to procure from Germany, or, in the case of items hitherto manufactured only in Germany or Austria-Hungary, to assist in the establishment of such manufactures in France. No doubt a similar feeling will be cherished by the majority of our readers. We wonder how many British firms that accepted the services of young Germans "desirous of learning the language" at a nominal price have paid for their seeming economy with the loss of customers worth tens of thousands a year to them, on the return of their artless pupils to the Fatherland, loaded with detailed information regarding their trade and clientèle. Nevermore! trade and clientèle. Nevermore!

German Capital in Russia.—Reuter's agent at Petrograd states that the Department of the Ministry of the Interior, which is in charge of rural and municipal economic affairs, has opened an inquiry into the question as to how far municipal economy in Russian towns is dependent upon German markets and German capital.

Electricity Works Employés.—It having been represented that men, some married with families, had enlisted from the various Stoke Corporation electricity works, and that their places had been filled by single men of military age. Colonel Blizzard asked Mr. Yeaman, the electrical engineer, to make inquiries. The subject was brought before the Electricity Committee, and Mr. Yeaman was instructed to reply that the Electricity Department had sent a larger percentage of men than any other department of the Corporation—30 per cent. of its employés having enlisted, and 41 per cent. from the office staff. The general allegation of taking on single men of military age was disputed, but it was stated that the greatest difficulty had been found in obtaining men, and that a few more who would enlist were unable to do so because they could not be spared, particularly as the War Office, the Local Government Board, and local firms insisted upon an adequate supply of electricity being maintained for the production of munitions, etc. Mr. Yeaman concludes:—"I think you will agree that everything possible has been done by my committee to forward the interests which we fully recognize are national and not local, reserving merely the irreducible minimum for our own pressing local needs."—"Stafford Advertiser."

German Electrical Machinery Confiscated at Sydney.—

German Electrical Machinery Confiscated at Sydney.—
An Australian newspaper just to hand states that application was made to Sir William Cullen, President of the Prize Court, for the confiscation of seven cases of machinery seized on board the steamer "Annam" by the Commonwealth Government. The application was made b. Mr. H. E. Manning, who was instructed by the Commonwealth Crown Solicitor; Dr. Brissenden appeared for the Australian Metal Co., Ltd.; and Mr. P. Halse Rogers, for the Municipal Council of Sydney. Mr. Manning explained that in 1913 a contract was entered into between the Australian Metal Co. Ltd.; and a German firm for the supply of certain electrical contract was entered into between the Australian Metal Co. Ltd.; and a German firm for the supply of certain electrical machinery, to be ultimately used by the City Council. The original machinery was supplied and set up, but it was afterwards discovered that certain parts were defective. The Australian Metal Co. undertook to replace the defective parts, and in order to do that it was necessary to send to Germany. This was done in June, 1914, but it was not until September 29th, 1914, that the goods were shipped by the German firm, via Copenhagen. The vessel arrived at Sydney long after the outbreak of war, the cargo was discharged, and the goods in question were seized by the Customs authorities. The Australian Metal Co. had no communication with the German firm after the outbreak of war. The object of the present application was to obtain communication with the German firm after the outbreak of war. The object of the present application was to obtain an order from the Court confiscating the goods, which would be ultimately handed over to the City Council. The President said it was proved that the goods were ordered prior to the outbreak of hostilities, and the Australian Metal Co. who were merely carrying out the Council's order, were exempted entirely from any suggestion that they were trading with the enemy. The goods, however, having been dispatched from an enemy's country after a state of war existed, must be confiscated, and he made an order accordingly; no order as to costs. ingly; no order as to costs.

Trading with the Enemy.—The "Australian Mining Standard" states that Colin Leigh Remington, trading in Elizabeth Street, Melbourne, under the name of McLean & Elizabeth Street, Melbourne, under the name of McLean & Co., electrical engineers, was arrested in March and charged that "during the continuance of the present state of war. on September 3rd, 1914, at Melbourne, he did unlawfully attempt and unlawfully endeavour to trade with the enemy to wit—C. & F. Schlothaner, Ruhla, Germany; M. Reiner & Co., Hamburg, Germany; Schumanns Elektrizitatswerk. Leipsig, Plagwitz, Germany." Having been released on £500 bail, he came before Mr. Goldsmith, P.M., at the

Melbourne City Court on March 12th, to answer the charge. Mr. H. I. Cohen, who prosecuted, explained that accused was arrested because it was known that he was booked to leave for America on March 13th. Several letters to firms mentioned in the charge having been read, and Mr. Bryam having, in defence, argued that even after the proclamation prohibiting trading with the enemy, it was perfectly justifiable for a person in Australia or England to buy German manufactures from persons in neutral countries, provided the money in payment did not go to Germany, and the accused having stated that whatever he had done against the law had been done in ignorance, the Police Magistrate stated that he had no doubt that defendant had offended against the law. He could not understand how a business man could, within a few days of each other, have written such contradictory letters as two which had been read. If it was not attempting to trade with the enemy he did not know what was. He should say it was non-controversial. It was the sort of thing that could not go on. The thing that appeared to mitigate the offence was that it occurred on September 3rd. He (Mr. Goldsmith) did not regard the case as so grave as the matter that was before him some weeks ago, where an endeavour was made not only to obtain goods through a neutral country, but to have them branded as of other than German manufacture. In view of the circumstances, and the fact that the defendant had abstained later on from giving directions, the fine would be \$200, with \$26 6s. costs. Mr. Goldsmith added that in charges of this nature which might in future come before him, unless there were markedly mitigating circumstances in such cases, even though they were committed anterior to the first*case he had heard, he would order imprisonment. Those who traded with the enemy supplied them with munitions of war to destroy our soldiers.

Reuter's agent at Melbourne telegraphs, according to the "Financial Times," that Theodore Zwicker, an importer, has been fined the maximu

to trade with the enemy.

The German Cable Makers' Syndicate.—Shortly after the Outbreak of war the agreement of the Syndicate of German Cable Makers, which was on the point of expiration, was provisionally prolonged until the end of March, 1915. This temporary arrangement has now been extended to the close of the year. It is proposed to protract the combination definitely for a number of years after the conclusion of peace. The chairman of the Syndicate is Herr Berliner, general director of the Bergmann Electricity Works Co.

Anglo-Russian Trade Relations.—One of the features of

Anglo-Russian Trade Relations.—One of the features of the Anglo-Russian commercial entente, initiated some eight or nine years ago, was the establishment, contemporaneously, in London and Petrograd, of the Russian Section of the London Chamber of Commerce and the Russo-British Chamber, respectively. The latter has now branches in Warsaw, Odessa, and other leading Russian cities; the former includes in its membership practically all corporations and firms, financial and commercial, of any standing and importance in London, whether British or Russian, who are interested in trade between the two countries. The work that has been accomplished in the intervening years work that has been accomplished in the intervening work that has been accomplished in the intervening years has placed the organisations in question in a position to meet the new situation brought about by the war in a manner that would obviously have been impossible without a lengthy period of preparation. The Russian Section of the London Chamber of Commerce has at its disposal not only the large resources of that institution but the services of the special Statistical and Information Department of the Chamber, with its extensive commercial library. This department has been putting Russian buyers and English sellers, or vice versa, into business relations for some years now, but naturally since the outbreak of war this work has been very greatly extended. The department affords full information as to the products obtainable in each country and mation as to the products obtainable in each country and the manufacturers and merchants dealing in the various articles; the statistical and other information, as well as articles; the statistical and other information, as well as the experience gained in the past, is now of great benefit. At the present moment the Chamber is busily engaged in applying its resources with the object of meeting the present demands arising both here and in Russia, and, no doubt, the coming of summer and the re-opening of the trade routes connecting the two countries will again increase the work. The work of the Section is not, however, confined to introducing buyer and seller; many other subjects are handled. For example, at the meeting held on 23rd instant, a special committee was appointed to carry on the work initiated by an emergency committee nominated immediately after the outbreak of war, which will watch, in the interests of Anglo-Russian trade, negotiations for commercial treaties which may be concluded by Russia with various countries when the war is over. The committee, in addition, will consider all questions bearing on the general subject of the extension of trade between Great Britain and Russia which may arise in the interim. Particular of the extension of trade between Great the general subject of the extension of trade between Great Britain and Russia which may arise in the interim. Particulars of the new Russian Customs Tariff which, broadly speaking, increases the duties on British goods by 10 per cent., and on those from Germany, Austria-Hungary, and Turkey by 100 per cent., were announced. The result of correspondence with the Censor on the subject of transmitting telegrams in the Russian language was also communicated, whilst among other subjects which were discussed with a view to action was the effect of Clause 5 of the Finance Act. 1914, upon Russian shareholders in

British companies operating in Russia, etc. A proposal

for an exhibition of British goods in Russia, etc. A proposal for an exhibition of British goods in Russia was also discussed and deferred for further details.

Belgium's Hour of Need: An Appeal.—In common with the editors of other publications, we have this week received an appeal on behalf of the millions of people who are on the verge of starvation in Belgium. We wish that we have the proposal to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a second to be a sec an appeal on behalf of the millions of people who are on the verge of starvation in Belgium. We wish that we had room to print it. It is eloquent, convincing, and heart-searching—we cannot attempt to summarise its arguments in a few words. True, great things have been done to enable those seven millions who remained behind in Belgium to keep body and soul together, but it is too horrible to contemplate the suffering, mental and physical, and the pangs of hunger, that we are authoritatively informed these brave people have undergone, and which they must yet experience while in the German grip unless more generous help is sent. while in the German grip unless more generous help is sent. The German army of occupation refuses to feed them, and "unless we get more assistance hundreds of thousands will actually starve." We have opened our columns in these terrible war-days to many appeals not purely electrical, but we are sure that there is none that can with greater justice lay claim to our assistance. The appeal of the National Committee for Relief in Belgium is signed by representatives of varied interests, and the committee has among its mem-bers men and women from almost every conceivable walk bers men and women from almost every conceivable walk in British life, and we have no hesitation in urging our readers—all of whom recognize the vast debt we owe to Belgium—to do their utmost for these millions who suffer because of the immortal bravery of our Ally in defending its own honour and obstructing the way to Paris, to Calais, and, perhaps—to London. Donations may be sent to Mr. A. Shirley Benn, the Hon. Treasurer, Trafalgar Buildings, Trafalgar Square, London, W.C.

Engineer Volunteer Training Corps.—The replies received to the circular recently issued by the Institution of Electrical Engineers to the members residing in the London district have been communicated to the Central Association of

trict have been communicated to the Central Association of Volunteer Training Corps, whose Engineering Adviser is of opinion that the response received is sufficient for the matter to be proceeded with, and enrolment forms have accordingly been sent to all those who have expressed will-Corps. Further enrolment forms for members whose residence or occupation is in the London district can be obtained at the Institution of Electrical Engineers, Victoria Embankment, W.C.

German-Russian Electric Finance cum Force Majeure.—
According to the "Utro Rossi," Moscow circles are credibly informed that a lively business is being done in Brussels in the transfer of German concerns in Russia to Belgian share informed that a lively business is being done in Brussels in the transfer of German concerns in Russia to Belgian share companies which have been established for the purpose. The acts of sale take place with the observance of all legal formalities, and are registered at the Spanish Consulate, scrupulously fulfilling the obligations of the Russian Consulate. All this is done in the expectation of using the Belgian firms and preserving in German hands the power to control the concerns in Russia which according to the existing law they should lose. The Belgian Government has accurate information showing that up to now 38 such transactions have been registered, of which seven are related to the General Electricity Company-trust, which was interested before the war in electrical undertakings in Riga, Keiff, Bielostok, Radom, Chenstochoff, and Simferpol. Nearly all the shares in the Kieff Lighting Company have now been transferred, of course, fictitiously, to it. In exchange for them German shareholders will receive shares in the Belgian trust. Our Allies, continues the Russian journal, are obliged to execute the operations under German compulsion. After the war they will explain them, and in the Belgian trust. Our Allies, continues the Russian journal, are obliged to execute the operations under German compulsion. After the war they will explain them, and they will be cancelled. But for the edification of the presumptuous Germans, it would do no harm to put existing law into force on the liquidation of German businesses in Russia, with a clear intimation that the transfer of such businesses, effected no matter how, abroad, will be treated as null and void in Russia.

Personal.—The following announcements appeared in the "London Gazette" on April 27th:—Territorial Force: Hampshire (Fortress) Engineers. The undermentioned to be Second Lieutenants. March 25th:—No. 4 Electric Lights Company—Sapper Harold Tom White. No. 6 Electric Lights Company—Norman Mansfield Radermacher.

London Electrical Engineers: The undermentioned to be Second Lieutenants. Dated April 28th, 1915:—Corporal Thomas Hepburn Gotch, Lance-Corporal Gerald Fergus Wood, Private Alfred Blackie, from the 28th (County of London) Battalion, The London Regiment (Artists Rifles).

Mr. A. R. Farrow, who has been gazetted Second-Lieutenant in the R.F.A. (2nd Home Counties' Brigade), is the son of Mr. A. E. Farrow, manager of the Windsor Electric Light Works, and was a pupil in the Diesel Engineering Works at Manchester.

Roll of Honour.—Private John Hoose, of Frodsham, who was employed at the Helsby Cable Works before the war

neering Works at Manchester.

Roll of Honour.—Private John Hoose, of Frodsham, who was employed at the Helsby Cable Works before the war, has been killed in action. He was serving with the 2nd Welsh Regiment, and was shot in the head. Deceased, who had previously been wounded and had returned to the front, has left a widow and two children.

Lance-Corporal Walter Hewett and Private Charles Webber, who were arc lamp attendants in the employ of the Stepney B.C. electricity department, have been killed in action.

in action.

## BUSINESS NOTES.

Consular Notes.—GERMANY.—The American Consulat Berlin reports that the merchants of the city of Berlin have taken preliminary steps to quote hereafter, when normal times have arrived, independent prices for zinc, lead, aluminium, and antimony. This measure involves the further extension of the activities of the Berlin Metal Exchange, and its prime object is to create independence for the German metal trade from the quotations in London. The American Consul is of opinion that this proceeding is justified in view of actual conditions in the relative production and consumption of metals in the various European countries. He considers it an anomaly in the metal trades that the price of zinc, for instance, of which Germany is one of the foremost producers and consumers, is fixed in London.

INDIA.—The American Consul at Bombay reports that the Railway Board of India has issuedinatructions to install electric lighting in all carriages on State worked railway systems. The change will of necessity take time to carry out, but the general adoption of electric lighting has now been decided on and will gradually be brought about as funds and time permit.

Stoker Contracts,—The following is a list of recent sales of stokers by the Underfeed Stoker Co., Ltd., to electrical undertakings:—

Borough of Leigh Electricity Department . . . 2 E. Lisbon Electric Tranways . . . . . 1 E. Derbyshire & Nottinghamshire Electric Power Co. . . 6 B. Blackpool Corporation Electricity Department . . . 9 E.

Other orders executed include those for Priestman Collieries, Newcastle-on-Tyne; Davidson & Co., Belfast; Edward Sassoon Mills, Bombay; National Steam Car Co., Chelmsford; and the Delagos Bay Davelopment Corporation.

Catalogues and Lists.—WESTMINSTER TOOL AND ELECTRIC Co., Suffolk House, Laurence Pountney Hill, London, E.C.—Small illustrated and priced leaflets of lifting magnets, electric drills, and electric blowers. The company's telegraphic address has been changed from "Aphasitic-Cannon-London," to "Westoleloo-Cannon-London."

THE EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., Ponders Edd.—Lasflet No. H 3,097 gives prices and particulars of domestic fans for the coming summer season. Customers can have these overprinted in quantities of 250 up. Leaflet No. A 3,096 (8 pages), gives details and reduced prices of "Eliswan" foolproof, quick-make and quick-break ironclad switches and switch fuses (250 and 600 volts)

MR. G. BRAULIK, 8, Lambeth Hill, London, E.C.—Twelve-page illustrated catalogue giving fully tabulated details and prices of "Therma" electric cooking and heating apparatus—boilers, cooking plates, ranges, baking and roasting ovens, &c.

CONTRAFLO CONDENSER AND KINETIC AIR PUMP CO, LTD., 3, Central Buildings. Westminster, London, S.W.—Thirty-two-page illustrated pamphlet, containing a very full description of the Contralfib-Kinetic system. The pictures show these condensing and air-pump equipments applied to power station plants in Buenos Aires, Japan, China, Rochdale, Lots Road, Dunston, Bolton, &c. A tabular list gives particulars of Kinetic plants supplied or on order, ranging from 500 to 25,000 kw.

MESSES. GEO. SCHULTZ & Co., LTD., 10, Bush Lane, London, E.C.—New catalogue (24 pp.) giving particulars and prices of various electrical insulation materials which they are now manufacturing at Manchester. They have recently acquired additional premises, increasing their output facilities, and considerable stocks are carried of these and other manufactures, including enamel insulated wire.

THE GENERAL ACCESSORIES Co., LTD., 70. Worship Street, London, E.C.—Eighty-six-page catalogue containing illustrations and prices of electrical accessories of British manufacture—lampholders, switches, bells and bell-pushes, fuse and distribution-boards, and so forth.

MESSES. DONOVAN & Co., 47, Cornwall Street, Birmingham.— Illustrated priced leafists relating to carbon-filament lamps and Barwick motor-starters.

MESSRS. A. P. LUNDBERG & SONS, 477 to 489, Liverpool Road, London, N.—Twelve-page illustrated list (S. 38) giving full particulars, with diagrams, prices, &c., of their "Pivot" single-way and two-way tumbler switches.

MESSES. HERBERT MORRIS, LTD., Empress Works, Lough-borough.—Illustrated and priced pamphlet, No. 62, relating to their standard pulley-block, crane, runway and other manufactures

borough.—Hustrated and priced pamphiet, No. 62, relating to their standard pulley-block, crane, runway and other manufactures.

Masses. Rose Bros., 38 and 39, Brech Street, London, E.C.—Eight-page illustrated catalogue of electrical instruments made by the Compagnie F.A.C. Da and Dutilh, of Paris, for whom the firm are sole British agents. Pocket, switchboard, and motor-car and lamp-testing instruments are shown and priced, also accumulator charging boards.

GENERAL ELECTRIC Co., LTD., 67, Queen Victoria Street, London, E.C.—Illustrated and descriptive price leaflet of the "No-Cell" dynamo outfit for motor-cars, giving head-light illumination without accumulators.

BRITISH THOMSON-HOUSTON Co., LTD., Rugby.—List No. 2,255 (8 pp.), giving full description and tabulated dimensions of their new type D.Q. continuous-current motors, ranging from 0.15 to 10 H.P.

THE WESTINGHOUSE COOPER HEWITT Co., LTD., 80, York Road, King's Cross, N.—New list of mercury vapour converters for transforming alternating to direct current, which are made up to 80 amperes at 250 volts, single and three-phase, and are guaranteed for stated period:

THE ELECTRIC AND GENERAL WORKS, LTD., 15, Victoria Street, Lundon, S.W.—Illustrated leaflet showing switches, circuit-breakers, motor control boxes, protective apparatus fuses, and other apparatus, of which they have a collection of samples on view at the above address.

ELECTRICAL SUPPLIES Co., 53, Victoria Street, London, S.W.—Folder giving prices of electric bells, which are made in a London factory.

MESSES. ALFRED HEBBERT, LTD., Coventry.—The firm's Monthly Review of modern machine shop practice for April contains a good deal of useful information, and includes an article on electrical machinery, written from the standpoint of the man who has charge of such plant.

Gears and Pinions.—Messes. Scholey & Co., Ltd., have received a contract for tool steel gears and pinions from the Croydon Corporation Tramways Department. They have also recently received large orders from the following:—

The Oerlikon Co. (L. & N.W. Railway electrification).
L.B. & d.C. Railway.
East Ham Corporation Tramways.
Pretoria Munic pality.
Colombo Electric Tramways & Lighting Co.
Johannesburg Municipality.
Auckland Electric Tramways Co.

Private Arrangements,—Harry J. Booker, electrical engineer, 51, Tothill Street, Westminster, London, S.W.—A meeting of the creditors of the above was held on Monday at the offices of Mr. James Mortimer, accountant and auditor, 3, Pancras Lane, Cheapside, E.C. Mr. P. Houstoun, who represented several of the creditors, was elected to the chair. The statement of affairs presented by Mr. Mortimer showed liabilities of £1,043. The indebtedness to the trade was £923, and the balance of £120 was due to Mr. J. Grevener for cash advanced. The assets consisted of cash at bank, £55; stock-in-trade £19, expected to produce £10; book debts £611, estimated to realise £580; and motor-car, £100. The assets therefore totalled £746, or a deficiency of £298. Mr. Mortimer stated that the debtor was seriously ill, and was a present at Yarmouth. Up to a recent date he had been in a Sanatorium, and had been in ill-health for some months. Owing to pressure by a creditor he consulted his solicitor, and it was then decided that an investigation should be made. The debtor gave instructions for the investigation, and said that if it was thought necessary the creditors should be called together. The debtor only started business in March of last year, and he then had a small capital, but he owed money to Mr. Grevener, and he probably only had an excess of assets over liabilities of about £1. The books had not been properly kept, but as far as could be seen the purchases had amounted to £2,245, while the sales had been £2,590. In answer to questions, Mr. Mortimer said that the debtor would not make any offer. But for the war the present position would not have arisen. The debtor dealt chiefly with German manufacturers, and he had not been able to get his supplies. Nevertheless, had it not been for his illness, the debtor would probably have made the business a success. After a short discussion it was unanimously decided that the estate should be dealt with under a deed of assignment, with Mr. G. E. Corfield, of Mesars. Corfield & Cripwell, B

FARDON & CARPENTER, LTD., electrical engineers, 4, Maidenhead Court, London, E.C.—A meeting of the creditors of the above was held last Friday at the officee of Messes. Confield & Cripwell, Balfour House, Finebury Pavement, E.C. Mr. G. E. Corfield, the liquidator of the company, presented a statement of affairs which showed liabilities of £621, of which £389 was due to the trade and £232 to "other creditors." The assets consisted of cash in hand £231, and book debts £105, estimated to realise £65. The assets thus totalled £356, or a deficiency as regarded the creditors of £265. It was reported that the company was registered on December 31st, 1913, with a nominal capital of £2,002, and that it took over the business of the Emerson Works. The company had issued debentures for about £300. Last Ostober the debenture-holder appointed Mr. Carpenter as receiver and manager. He had since sold all the a-sets, paid off the debenture, and after deducting the costs and expenses there was a balance remaining of £291, which he had handed over to the liquidator. The "other creditors" referred to in the statement of affairs were principally in respect of claims by the directors under agreements with the company. The creditor-decided to confirm the voluntary liquidation of the company, with Mr. Corfield as liquidator. The latter stated that it was a simple liquidation, and that as soon as the book debts had been collected a dividend would be paid.

Australia.—A Brisbane firm desires to secure agencies of British makers of engineering specialities, electric cranes, and other machinery requiring expert handling. Application should be made to the Board of Trade Commercial Intelligence Branch, in London

Book Notices.—First Principles of Production. By J.T. Peddie. London: Longmans, Green & Co. Price 53. net.—Herein the author essays a study of the first principles of production and the relation of science to industry and to evolve a basis for a new Imperialism—truly a formidable task, but one which he performs with a considerable measure of success. We take is ue, however, with the very first sentence of his introduction, and much regret with the very first sentence of his introduction, and much regret that such an unfortunate sentiment should be given such prominence. "At the conclusion of the great war," writes Mr. Peddie, "it will be necessary for the leaders of British industry and science to take stock of their positions." At the conclusion of the war it will be too late to do any such thing. The primary needs of the moment are well known, and they must not be neglected in the least degree, but amid all the stress and strain of turning out munitions of war on an unprecedented scale, our leaders of industry munitions of war on an unprecedented scale, our leaders of industry and science must find time to mend their ways of peace and see that our new industrial and commercial policies are in full working order on the first day of peace, wherever the war prevents their earlier application. The first day of peace will be the first day of an industrial war for which we must be prepared—for which we must now prepare—and the outstanding omission from Mr. Peddie's book is neglect to insist sufficiently on the need for instant action by every industrial leader and manufacturer, each in his own field. With Mr. Peddie's estimate of the evil effects on us of the reduced standard of wages and living in Germany after in his own field. With Mr. Feddle's estimate of the evil effects on us of the reduced standard of wages and living in Germany after the war, we are in entire agreement. We suggest only that he over-estimates the advantage we have in the "breathing space now afforded us." In point of fact, we must rely on no period of grace.

Matters in which it is easy to agree with the author are the neces-

matters in which it is easy to agree with the author are the inecessity for giving greater pecuniary support and recognition to science and scientists; the rank folly of splitting our industrial barque on the reefs of political interest and dogma; and the desirability of improving our technical education facilities, particularly in respect of really efficient commercial training. The short paper which gives its title to this volume represents a sound, general survey of the classes of our community and the factors going to make up cost of production; it is followed by a yet shorter paper (about 1,700 words) on "The State and Opportunity in Industry." An essay on Tariffs, Free Trade and Industry insists upon the indivisibility of the state and free trade problems and present several fresh and the tariff and free trade problems, and presents several fresh arguments on this hoary subject. In discussing the "Influence of Science on Political Exquency," the author's chief point is that political economy must be adapted to and judged by the period to which it applies. We are given an interesting review of the past effects of invention, scientific developments and tariff changes on industrial expansion, but we seek in vain for any definite practical suggestions for present action. A paper on "Finance and Industry" points out the advantages, limitations and dangers of German banking policy, and we agree that industry must show that it is prepared to operate on efficient and truly scientific bases before it can receive satisfactory support from banks. This sessay is followed by a brief compilation, laying emphasis on the importance of science in industry and presenting several striking instances of German methods and achievements. The remainder of the volume is chiefly devoted to reprints. The work is not indexed, and, though well worth reading, it does not unfold any organised, continuous policy for immediate application. Though effects of invention, scientific developments and tariff changes on organised, continuous policy for immediate application. Though much may be done by co-operation and State action in the near future, the immediate necessity is for reform along well-known lines by individual firms in details and ramifications of their methods and activities, which are known only to themselves, and can be set in order only by effort from within.

and can be set in order only by effort from within.

An Italian View of the Russian Market.—The Italian Consul General at Moscow reports as under on the mode of cultivating the Russian market:—"If there is a desire in Italy to successfully prosecute Russian trade from Moscow it behoves our manufacturers to set about the business seriously. Under the special circumstances ruling here it is needful that the representative in Moscow should possess the following qualifications:—
(a) At least an approximate knowledge of Russian; a foreign tongue, even if it were French, would immediately be met with diffidence. Little sympathy is extended to a foreign tongue and its use can only eventuate in prejudicing a dealing. (b) The possession of ample funds for advertising and other expenses. (a) The possession not only of catalogues, but of a full range of samples, for the Muscovite merchant is averse to knying without the state of a maller. These are at Mayor a purpose of the lines. the sight of samples. There are at Mosoow a number of Italians and other foreigners who are in a position to take up such representation. It would be an illusion to consider that the conquest of this market is an easy matter, for Japan, on one hand, and England on the other, have already been very active, with the same object, since the outbreak of the war; and, moreover, are able to offer the following advantages:—(a) More easy and more direct transport: (b) greater credit facilities, for English and Japanese manufacturers and exporters are in the habit, in this extraordinary period, of granting facilities for payment, whereas Italian merchants are always obdurate and diffident; it should, however, be borne in mind that it is needful to rick something in the first transactions. Italian merchants should quote lower prices for orders from Russia than from other countries, as do both England and Japan. Italian manufacturers are certainly right in selling their products to the highest hidder but the Muscovite is also right in refusing to the highest bidder, but the Muscovite is also right in refusing to the highest bidder, but the Muscovite is also right in refusing to buy from Italy an article at 10, which he can obtain from Japan and England at 9. While, therefore, continuing to sell to other countries at 10, our manufacturers should examine the question, and see if it is not worth while selling at Moscow at 9, bearing in mind that the Muscovite market, with its infinite and insatiable hinterland in Europe and in A-ia, and a yearly trade movement of 5 milliards of france, will always continue to buy, even when the war is ended. This certainty is a subject worthy of our greatest attention." our greatest_attention.

Bankruptcy Proceedings. — James Proctor Kyd CLARK, lately trading as an electrical and mechanical engineer, at Hythe Road, Willesden Junction, N.W., under the style of George Dayer & Son.—The public examination was held last week before Mr. Registrar Hood, at the Lindon Bankruptoy Court. The debtor applied to pass upon accounts showing total liabilities £2,167 (unsecured £222), and assets nil. Replying to Mr. Daniel Williams, Official Receiver, the debtor stated that having previously been in employment, he, in 1895, became a partner with two other persons in the business of electrical and mechanical engineers carried on at Euston Road by Mr. G. H. Driver, an inventor. Witness put in £500 capital upon being admitted a partner. During 1900 Mr. Findgate, one of the partners, retired from the business, upon an Fladgate, one of the partners, retired from the business, upon an undertaking that the remaining partners should pay him 5 per cent. interest on £1,500 capital which he had left in the firm. In the previous year the business had been removed to Willesden Junction. It was part of the arrangement with Mr. Fladgate that in the event of the interest falling three months in arrear the principal amount was to become recoverable, and that in the event of Mr. Fladgate's death the interest should be paid to his sister during her lifetime. Mr. Driver, the other partner, died in November, 1903, his capital being then agreed at £1,600, which witness paid to the representatives of the deceased giving them November, 1903, his capital being then agreed at £1,600, which witness paid to the representatives of the deceased, giving them at the same time a release from any possible claim in respect of the Fladgate liability. Witness further arranged with the latter gentleman to pay off one-half of the said £1,500 by instalments, and to continue the payment of interest on the other half. He had only paid, however, £250 off the principal amount, but continued the business alone until November, 1914, when, owing to lack of capital and pressure by creditors, he transferred it, as from September 30.h, 1914, to his manager. Generally speaking, it had been a successful business. manager. Generally speaking, it had been a successful business, and the balance-sheet for the year ended March, 1914, showed a profit of £1,400. It, however, suffered by the lapse of patents and heavy competition. The debtor was examined at considerable length with reference to the disposal of his business, and was asked whether he did not get rid of it in order to defeat a judgment oreditor. He asserted that his chief reason was that he was ment creditor. He asserted that his chief reason was that he was anxious to get into the motor-boat service and go to sea, but he frankly admitted that the result of the transaction was to leave the judgment creditor entirely out in the cold. The examination was concluded.

The Prentice "Lightning" Cooker.—The Armor-DUCT MANUFACTURING CO., LTD., ask us to state that owing to certain rearrangements which are being made at their Witton Works, they have decided to relinquish the manufacture of Mr. Napier Prentice's "Lightning" cooker, for which they held the sole licence. They state that other engagements prevent them from doing justice to Mr. Prentice's interests in the development. of the cooker at present, and they understand that Mr. Prentice will be making arrangements for the manufacture of the cooker by some other firm.

The B.E.A.M.A.—The following firms have recently been elected members of the B.E.A.M.A.:—The Mirrlees Watson Co., Ltd.; John Musgrave & Sons (1913), I.td.; Newton Bros., Derby; Isaac Storey & Sons, Ltd., Branch of United Brassfounders and Engineers, Ltd.

## LIGHTING and POWER NOTES.

The L.G.B. having Aldershot.--Proposed Loans.intimated to the U.D.C., which had applied for a loan of £8,500 for electricity purposes, that no loans were being granted except in cases of pressing necessity, the Council has decided to point out that the work needed is pressing, as current is being supplied to firms engaged on army contracts. Tenders received for additional plant have been referred to the Lighting Committee.

Argentina.—The Compania Italo-Argentina de Elec-Argentina.—Ine Compania Italo-Argentina de Electricidad recently inaugurated its No. 2 power house, situated in Calle Tres Sargentos. The new station now serves the important area comprised between Callao, Avenida de Mayo and Paseo de Julio. The Tres Sargentos power station is the largest of the numerous minor stations. It has a capacity of 8,000 to 10,000 H.P. The third station, situated at Calle Balcarce 547, will be opened to public service in a few weeks. There three stations, in conjunction with three others in construction and with the large central power station in the Roca, will enable this company to central power station in the Boca, will enable this company to meet all demands in the central part of the city.—Review of River Plate.

Blackpool.—YEAR'S WORKING.—The total income of the electricity department for the year just ended was £17,326, an increase of £2,330; and working expenses amounted to £24,066, while interest and sinking fund charges came to £14,761. The profit was £8,499, or over £1,000 more than a year ago. During the coming year it is expected to make a profit of about £5,000. There are 2,870 consumers, the new customers during the year numbering 409.

Bolton.—I..G.B. INQUIRY.—An inquiry was held on April 22nd into an application to borrow £45,032 for the electricity undertaking. The first part of the inquiry related to £23,032 for converter and other plant, necessary in order that full benefit might be obtained from the new works at Back-o'-th'-Bank. It was explained that there were four systems of supply at Spa Road works, requiring different plant for each, and the cost of generating would be substantially reduced if the whole supply could be generated by one plant. The Committee proposed, therefore, to transfer generation from Spa Road to Back-o'-th'-Bank, and by altering the system of distribution the department would be saved £8,714 per annum. The Town Clerk intimated that the Corporation had suspended other works on capital and revenue account to the extent of something like £275,000 in order to comply with the requirements of the Board and the Treasury.

The other part of the inquiry related to £5,000 for the equip-Bolton.—L.G.B. INQUIRY.—An inquiry was held on

The other part of the inquiry related to £5,000 for the equipment of eub-stations on consumers premises, and £17,000 for mains. There was no opposition.

Buckhurst Hill. - Prov. Order. - The County of London Electric Supply Co. has informed the local authority that it has decided not to proceed with the application for a prov. order for E.L. at Buckhurst Hill, Woodford, Wanstead and

Bury.—The Corporation Electricity Committee was informed last week that while excavations were being made for the foundation of the retaining wall in connection with the Chamber Hall electricity works extensions a seam of coal had been discovered, and that some tons of coal had been obtained and used at the works,

Cahirciveen.—E.L. Scheme.—In connection with the electric lighting scheme, Mr. W. J. U. Sowter, of Bray, has been instructed to report on the plans and specifications submitted by the Ampere Electric Lighting Co. Application has been made to the Irish Congested District Board for permission to build the power house and works; as soon as this is granted and the plans approved the work will be proceeded with.

Castlewellan.—Street Lighting.—The Belfast News Letter of April 23rd states that at a meeting held on April 23rd it was decided to accept the proposal of the Irish Town Lighting Co. to generate and supply electricity for 40 street lamps, at £40 per annum.

Chile.—The electric light company of Santiago recently informed the municipality that unless its debt of \$1,500,000 for electric light was paid, the contract will be annulled.—Review of the River Plate.

Clacton-on-Sea.—L.G.B. INQUIRY.—An inquiry was held last week into the application of the U.D.O. for a loan of £1,300 for a new battery at the electricity works. The engineer reported that to keep the old battery in its present condition would cost from £100 to £150 a year. The Council, it was stated, had contracted with the D.P. Battery Co. for a new battery at a cost of £1,690, with an estimated allowance of £429 for old material, and the work had been commenced in anticipation of a loan being sanctioned. There was no opposition.

Continental.—Russia.—The Russian journal La Cause Continental.—Russia.—The Russian journal La Cause Municipale has recently made an inquiry into the electric installation schemes projected in the various Russian towns and cities. It appears that electric lighting installations are contemplated in the following municipal areas:—Armianak, Atohinak, Bobronyak, Borovitchi, Borzna, Chadrinak, Gorodok, Jakobstad, Jamburg, Jaranek, Jenisseysk, Kamychlov, Kinechma (concession), Krasnokoutsk, Kobelaki, Kolomna, Korotcha, Koustanai (concession), Lenkoran, Neavige, Novgorod, Novo-Alexandrovsk Ossa, Ostrov, Penza, Poltava (new station), Pronak, Soroki, Starobelak, Sheslitamak, Svüajak, Taganrog, Toipeé, ¡Zadonsk and Zɔlanocha. Enlargement of central stations are contemplated in the following:—Balaclava, Lipetzk, Oskol, Sorimy, Tchernigov, Tifiia, Ariev (Government of Lifland), Viatka and Vologdu.

Electric tramway installations are prejected in the following

Ariev (Government of Lifland), Viatka and Vologdu.

Electric tramway installations are projected in the following places:—Bacou, Jalta, Conganek (concession), Kontais, Osmak, Orenburg, Ouman, Penza, Poltava, Samarkand (concession), Tambov, Tomsk and Varonege. Lastly, extensions of electric tramway networks are under way at Olessa, Rostov on the Don, and Vladivostok. The redemption of an electric tramway and lighting installation in Smolenak has been decided upon, to be given effect to in the course of the current year. The redemption of the tramway alone is contemplated at Tiflis. At Ivanovo-Voznessensk the building of a generating station has been begun.

The Pyatigorsk Echo says that the Lighting Committee of the town has signed a contract for the construction of an electric station, the work to begin this spring.

station, the work to begin this spring

The District Government of Viadikavkaz has asked for a portion of land to be set apart for the purpose of constructing an electric

Coventry.—PLANT EXTENSIONS.—The Electricity Committee recommends that a spare stator and spare motor be obtained for use in connection with the turbo-alternators at the electricity works, at an estimated cost of £1,658, and that certain property in Stoneleigh Terrace he purchased for the purposes of a substation, at a cost of £200. Both amounts are to be paid out of revenue.—Midland Daily Telegraph.

Dalkey.—PROPOSED E.L.—The Urban Council has, says the Freeman's Journal, been informed that the Kingstown Council, under its Electric Lighting Order, would be in a position to supply electric light to the township, and has referred the matter to a Committee for report.

Dover.-New Plant.-The town clerk has reported to the Electricity Committee that he believed that the L.G.B. was satisfied with the Corporation's application for a loan of £6,000 for new plant, and the engineer was instructed to obtain tenders as soon as the sanction was received. The estimated value (£1,000) of the sets to be superseded will have to be paid out of revenue, spread over three years. "Public service" badges are to be provided for the staff at the works.

Dublin.—The Electricity Supply Committee has purchased 20,000 pairs of carbons for the old type of city arc lamps, also supplies of various carbons for the fisme arc lamps, which will keep the city lighting adequately maintained until the end of Ostober next,

East Grinstead.—Prov. Order.—It is understood that the B. of T. will grant the application of the U.D.C. for a prov. order for E.L., but only for a date to be fixed at the end of

Falkirk.—On account of the extra expenditure on coal, &c., the Corporation has increased the charges for electric current by about 30 per cent. Reference was made at a meeting of the T.C. to the fine spirit shown by firms who had contracts with the electricity department, and who had agreed without demur to pay the increased charges when they might have interpreted the contracts in the strictest sense.

Heywood.—YEAR'S WORKING.—On the past year's working of the electricity undertaking there was a loss of £927, against £4,610 in the previous year. To cover this, and a loss of £1,042 on the tramways, the department has decided to ask for a sum equal to a rate of 6d. in the £.

Huddersfield.—WAGES.—At a meeting of the Electricity Committee consideration was given to an application by the Municipal Employes' Association for an increase in wages of 2s. er week, and it was resolved that the Association be informed per week, and it was resolved that the Association be informed that a rise of 2s. was given to employes in January last, and that the wages of the enginemen and firers be increased ½d. per hour as from the date of the meeting. The Committee, after consideration of the electrical engineer's report as to minimum charges for energy, decided that the minimum charge for energy supplied, iccluding meter rent, should be 10s, per half year. The Committee also resolved that for the present no alteration should be made in the charges for are lamps. the charges for arc lamps.

Hull.—LOAN SANCTION.—The T.C. has received the sanction of the L.G.B. to a loan of £27,300 for the purchase of new generating plant already installed. The Electricity Committee, owing to the stopping of capital expenditure, has decided to temporarily stop the hiring out of motors, but new services will still be converted and the sections to the received the services. will still be connected, and the cost met out of revenue.

India.—According to the Indian Textile Journal, the equipment of the Karahi Electric Supply Corporation's station, which was recently opened, consists of a 100-H.P. and two 240-H.P. Mirrlees Diesel engines, coupled to Crompton dynamos, and working in conjunction with a 276-cell Tudor battery, and Crompton boosters. For balancing, two C.M.B. balancers are installed. The supply is on the three-wire system at 440-220 volts, and is given by overhead mains of stranded copper carried on steel poles. The mains work was carried out by Messrs, Henley.

Keighley.—The Morton P.C. has passed a resolution deploring the action of the Keighley R.D.C. in granting the Keighley Corporation the privilege of supplying electricity to the Morton Banks portion of the rural district, believing that such action would result in Morton Banks being absorbed into the borough. It was stated that at Morton Banks 214 of the 310 ratepayers, and in Morton 250 out of 330 ratepayers had signed a petition against the supply of electricity by the Corporation.

Kingstown.—The U.D.C. has received a report from its law agent to the effect that a deed of transfer had been executed of the Dublin and Southern District Electric Supply Co.'s rights and property in a prov. order for electric lighting, to the Kingstown U.D.C. The report stated that the company had received all moneys payable in connection therewith, except the amount claimed as arbitration costs, which would be paid when taxed.— Freeman's Journal.

Leeds.—RESTRICTED LIGHTING.—Further restrictions of lighting have been put into operation by the authorities. Both of lighting have been put into operation by the authorities. Both gas and electric lighting in the streets are to be extinguished each night at 11.30, with the exception of Saturday, when the lights will be allowed to remain on until midnight. Should any hostile airships be reported as approaching the city, all lighting will be cut off, no matter what the hour may be.

London.-L.C.C.-The Finance Committee reports that from information supplied by the Woolwich BC, with its application for sanction to the borrowing of £48,000 for its electricity undertaking, it transpires that the 650-kw. plant at the Plumstead station, of which the B.C. entered into an agreement to expedite stand-by plant. The general position appears to be that none of the older plant at the Woolwich and Plumstead stations can at present be regarded as obsolete, as the B C. is now making use of all its plant, except certain plant at Plumstead, to the amount of 450 kW., for which the boiler power is not available, and that all the older plant, both at Plumstead and Globe Lane, will more or less be "stand-by" plant when all the new plant is in working order. This being so, the Committee recommends that the acceleration of payments shall be applied and the acceleration of payments shall be applied and the acceleration of payments shall be applied. tion of payments shall be annulled, and the original terms of repayment revived on the understanding that the outstanding debt on the plant in question shall be repaid as soon as the plant becomes

The Highways Committee has approved agreements proposed to be entered into for a reciprocal supply of electricity between the Woolwich B C., the South Metropolitan Electric Light and Power

Woolwich B C., the South Metropolitan Electric Light and Power Co., Ltd., and the West Kent Electric Co., Ltd.

The number of electric pressure stations required by the Council to be established by supply authorities is 154, and 114 are actually established. The whole of the County Council areas of supply, except the areas of the Chelsea Co. and St. Panoras B.C., where the Council's inspectors have no jurisdiction, have been dealt with.

LEWISHAM.—Subject to legal approval of an agreement, the B. of G. has decided to allow the South Metropolitan E.L. and P. B. of G. has decided to allow the South Metropolitan E.L. and P. Co. to increase its charge for current by 10 per cent, on grounds arising out of the war, this to be without prejudice to the present contract. With this increase the Board will pay less than 2½d, per unit for current for lighting, and for power less than 1½d.

WOOLWICH.—The B.C. has decided, owing to the increased cost of coal, temporarily to increase the price of energy by ½d.

per unit.

SHOREDITCH.—The Electricity Committee reports having received an offer from a company, which is interested in the supply of oil for fuel purposes, to carry out experiments in the supply of oil fuel in one of the boilers at Whiston Street station, and to supply, free of charge, half the quantity of oil consumed, and also to supply the necessary apparatus. The Committee has accepted the offer.

HORNSEY.—In view of the L.G.B.'s order curtailing the expenditure of local governing authorities, the T.C. has inquired of the contractors supplying machinery, cable, &c., whether it is possible to stop further progress on works contracted for, and to postpone completion of the contracts for the present.

POPLAR.—The report of the Electricity Committee, referred to on p. 474, recommending a reduction of electric lighting charges, and proposing a profit-sharing scheme, has been adopted by the B.C., with one amendment relating to the transfer of money to the borough fund.

Manchester.—YEAR'S WORKING.—The gross income Manchester.—YEAR'S Working.—The gross income of the electricity department from all sources during the year just closed was £543,305, compared with £513,589 in the previous year. The net surplus, after meeting abnormal expenses of £12,266, war allowances to 275 employés with the Colours £6,015, additional incometax £3,287, and Parliamentary expenses re Local Act £2,964, was £35,850, against £36,006 in the previous year; £30,000 is to be contributed to rate relief. In the year just commenced it is estimated that sales will increase by about 9 million units. Last year nearly 10 million more units were sold, raising the total to nearly 128 million units. In view of various factors the question of a slight revision of charges is to be considered. revision of charges is to be considered.

Mansfield.—CAMP LIGHTING.—The L.G.B. has informed the T.C. with reference to the Council's application for sanction to a loan of \$2,000 for the provision of transforming and converting plant in connection with the electricity undertaking, for the supply of energy to the Clipstone military camp, that, in the circumstances, it has no objection to orders for the necessary plant and cables being placed at once.

Portuguese West Africa.—The British electric supply company in Angola is completing a hydro-electric plant on the Catumbella River. A 23-mile 20,000-volt transmission line will connect the new plant with the three largest towns. For current supplied to private parties the company charges 50 cents per kw.-hour for light and 11 cents for power.—Indian Textile Journal.

Ripon.—LOAN NOT SANCTIONED.—The Treasury has declined to approve the proposed raising of a loan of £12,000 by the Ripon Corporation for electricity works.

Rochdale.—YEAR'S WORKING. — The profit on the **ECOLOGISC.**—YEAR'S WORKING.—The profit on the electricity undertaking for 1914 was £1,523, against a loss of £330 in the previous year. The total receipts amounted to £33,553, against £30,471, and the working expenses were £18,279, against £20,492, leaving a gross profit of £15,274. Interest and sinking fund charges amounted to £13,751, an increase of £3,441. Capital expenditure during the year was £50,749, bringing the capital account up to £208,951. The department is asked to contribute £1,500 for rate

MILL DBIVING.—The new mills of the Tyre Yarns, Ltd., and Fabric Weavers, Ltd., are the first cotton mills in Rochdale in Fabric Weavers, Ltd., are the first cotton mills in Rochdale in which electricity is used for motive power and light throughout. Electricity is obtained from the Corporation, two new mains having been laid to the mills. When fully working the mills will take about 2,000 H.P., though this may be increased. The electricity is received at 6,000 volts and transformed to 400 volts. There are 1,500 lamps in the mills. The electrical work has been carried out by Mr. G. L. Adamson, of Ohm Works, Rochdale. Rochdale.

Runcorn.—At a meeting of the R.D.C. last week, it was reported that a conference had taken place at the B. offices in London respecting the proposed Warrington Electric Lighting Order. An official of the Board intimated that an extension must be made by Warrington towards the parish of Latchford Without, and, further, that the terms of supply in the area of the R.D.C. should be the same as for consumers in the

Selby.—E.L. SCHEME.—The U.D.C. has accepted the offer of the Electrical Distribution of Yorkshire, Ltd., to give an option to purchase as a going concern the proposed works in the urban district at the end of 21 years, or, failing this, at the end of 28 or 35 years.

Walthamstow.—Loan Sanction.—The U.D.C. has received sanction to borrow £6,986 for the installation of new plant at the electricity works.

Warwickshire.-In view of the increasing use of electricity in collieries, the Warwickshire Education Committee has instructed the Mining Lecturer to report as to the probable cost of suitable electrical equipment for instruction at the Mining School.

## TRAMWAY and RAILWAY NOTES.

Belfast.—Year's Working.—The annual report on the financial working of the Council's tramway system shows that the total revenue up to March 31st last was £270,237, and the working expenses £153,378, leaving a profit of £116,858. The net profit was £52,033, as compared with £51,257 in the previous year. The declaration of war sessiously affected the receipts, the loss being estimated at about £21,000 since Angust last. The amount which was paid to war dependents was £3,058, and the number of men who had volunteered for the war was 150.

Blackpool.—YEAR'S WORKING.—The income of the Corporation tramways for the past year amounted to £76,105, against £84.797 for the previous year. The total working expenses were £44,850, against £43,487 in 1913-14. Thus the gross balance was £31,255, as against the previous year's £41,310. The balance for disposal amounts to £13,737, against the previous year's £24,552. Mr. Furness ('he engineer) laid before his Committee figures showing the effect of the war upon municipal tramway undertakings in 18 towns. These showed Blackpool to have suffered more than any, the decrease in receipts being 13 per cent., compared with 8 per cent. at Accrington, 5½ per cent. at Salford, 4 per cent. at Blackburn, 3½ per cent. at Birkenhead, 3 per cent. at Wigan, 2½ per cent. at Oldham and Hull, 2½ per cent. at Warrington, 2 per cent. at Bournemouth, ½ per cent. at Brighton. &c. Three places showed increases—Newcastle-on-Tyne 12½ per cent., Birmingham 1½ per cent., and Sheffield 3 per cent.

Bradford.—The Tramways Committee has drawn the attention of the Street, Drainage and Works Committee to the dusty state of the streets and roads used for the railless service, and to the fact that unless the conditions could be improved there would be a suspension of the service. The latter Committee has replied that the work of improving the state of the thoroughfares concerned would be proceeded with in the ordinary way. The question which now remains is as to whether the "ordinary way" of dealing with the streets and roads will satisfy the requirements of the Tramways Committee.

Bury.—YEAR'S WORKING.—The tramways last year made a net profit of £8,472, to which should be added £897, paid in respect of men on active service. The same sum as last year—£5,000—will go to the relief of the borough rate. The profit on the Radoliffe section was £318.

Canary Islands. — The concession for the electric tramway in San Cristobel de la Laguna has been awarded to the Sociedad de Tranvias Electricos de Teneriffe. — Board of Trade Journal.

Cardiff.—Fenale Conductors.—Several women started work as conductors of tramcars on Thursday last week. In two days over 200 women offered to serve.

The tramway men, at a meeting on Sunday, passed resolutions protesting against the employment of females as conductors, declaring that plenty of males ineligible for military service were available.

Continental. — SWITZERLAND. — The Swiss Federal Railways Administration has decided to construct a hydroelectric station at Massaboden, near Brigue, to supply current for the working of the Simplon line. The new station will replace the provisional station built at the northern entrance of the tunnel. The equipment will comprise two 5,500 H.P Piccard and Picket turbines, running at 500 R.P.M., under a fall of 43 metres, with automatic regulators and other modern accessories.

East Ham.—The engineer and manager of the Corporation tramway department has drawn up a report on the rolling stock at his disposal, showing the necessity for modernising the equipment of the existing cars, in order to reduce the present excessive maintenance, and the purchase of additional cars in order to cope with traffic requirements. The Tramways Committee recommends that, as an experiment, one of the cars be fitted with a new type of equipment with 40-H.P. motors and new controllers, at a cost of £275. The question of the purchase of additional cars has been deferred.

Glasgow.—The special Sub-Committee of the Tramways on depreciation has had before it an abstract statement of the revenue and expenditure for the year to May 31st, 1914, showing a surplus of £53,892, with estimated figures for the year to May 31st, 1915, showing an estimated deficit of £31,017, and has agreed to recommend that allowances for depreciation be made in the accounts for the current financial year, as undernoted:—

		Year to May 81st, Y 1914.	Tear to May 81st, 1915.
Permanent way	•••	£440 per mile	£350 per mile
Elec. equipment of line	•••	Av., 4 3 p.c.	Av., 2'9 p.c.
Buildings and fixtures		2 1 ,,	2 1
Power plant	• • •	71,	ō ,,
Workshop plant	•••	7½ ,,	5 ,,
Cars	•••	$\Delta \mathbf{v}_{\cdot}, 9\frac{1}{2}$	Av., 8.2 ,,
Elec. equipment of cars	•••	$7\frac{1}{2}$ ,	6 ,,
Other rolling stock	•••	Av., 16 4 ,,	Av., 16'4 "
Miso. equipment	•••	$7\frac{1}{2}$ ,,	ō ,,

The Sub-Committee on Finance has continued consideration of the report, as also a suggestion that a sum of £20,000 be taken from the reserve fund—which amounts to £38,069—and paid over

to the common good fund of the city. The following information was also submitted:—Capital expenditure as at May 31st, 1914, £3,675,317 0s. 8d.; total amount at credit of renewals and depreciation as at May 31st, 1914, £2,158,738 18s. 6d.; amount set aside to meet renewals and depreciation for year to May 31st, 1914, £212,642 3s. 8d.; amount proposed for renewals and depreciation for year to May 31st, 1915, at suggested rates, £172,282 16s. 3d.; proposed reduction in renewals and depreciation for year to May 31st, 1915, £40,359 7s. 5d.

WAR EXPENSES.—A return, showing the extra expenditure incurred by the tramway department up to April 10th as a result of the war, has been prepared by the general manager. The total expenditure was £35,384, apportioned as follows:—Allowances to dependants, £30,360; car tokens to military and special constables, £4,308; special car, £241; pipe bands and drums for 15th Highland Light Infantry, £300; use of flare lamps, &c, £173. It is estimated that the total expenditure under the above headings to the end of the financial year on May 31st will amount to about £45,000.

The tramway system was brought to a complete stoppage for a short time on Thursday last week, through a workman having driven his pick into a high-tension cable near Parkston power station.

Huddersfield.—The T.C. has decided that the time is not now opportune for consideration of the extension of the tramway system to Lepton and Kirkheaton. The Committee has decided that a war bonus be paid in accordance with the resolution of the Council, based on the men's acutal earnings per week as taken from the wage book, and that time and a quarter be paid to the spare men after 5 p.m. on Saturdays after they have worked eight hours.

Leeds.—WAR BONUSES.—The tramway men have considered the offer of the authorities in respect of the payment of a war bonus, and have written expressing the view that the concessions offered are insufficient. The men state that the grant only amounts, in the majority of cases, to is, a week.

London.—L.C.C. TRAMWAY RECEIPTS. — The total traffic receipts for the year ended March 31st, 1915, were £2,323,053 from lines worked by electric traction, and £10.261 from lines worked by horse traction, a total of £2,333,314. The receipts for the previous year under the same heads were £2,181,344, £21,146 and £2,202,490 respectively. The total car-miles run were 52,224,529, and the number of passengers carried 534,793,356. During the year ended December 31st, 1913, the number of fatal accidents caused by the working of the electric tramways was 37, while the number during 1914 was 25; during last year Sudday was the day on which most fatal accidents occurred, the number on this day was 6, or nearly 25 per cent. of the total.

The Highways Committee reports that the London Electric Supply Corporation has intimated that owing to the considerable increase in the price of coal and labour it will be compelled to raise its price for power supplied to the tramways. The Committee has agreed that as from March 3rd, 1915, the rate to be paid by the Council shall be 4d a unit plus £3 a kw. per year for power supplied, but if only a stand-by supply is required, the charge is to be at the rate of £2 a kw. a year.

Manchester.—A meeting of the tramway workers has passed a resolution calling on the Tramway Committee to grant increased wages to all employés receiving up to 40s. per week, instead of the present limit of under 30s. per week.

Newcastle-on-Tyne.—Extensions Deferred.—The Longbenton U D C. has consented to the postponement of construction of the tramway from the city boundary to Longbenton, authorised by the Corporation Act of 1914, as a result of representations by the B. of T.

With reference to the differences between the T.C. and tramway-

With reference to the differences between the T.C. and tramwaymen in regard to wages, it is understood that the matter may be referred to arbitration.

Rawtenstall.—HALFPENNY FARES.—As an experiment halfpenny fares are to be charged on the Water section of the tramway from Monday to Friday in each week. The experiment will be tried for three months.

Rochdale.—Year's Working.—The working of the Corporation tramways last year, resulted in a net surplus of £4,284, which is £4 205 less than a year ago and £3,939 less than two years ago. The fall is due mainly to extra repairs to permanent way and cars, increased wages, increased income-tax, current, and allowances to men on active service. Total traffic revenue amounted to £83,401, and working expenses to £46,891. The Committee has asked that the surplus of £4,284 should go to reserve and renewals account in view of the heavy commitments that face the department.

Salford. — The Manchester Evening News recently stated that, owing to the war, the Corporation tramway undertaking is being worked at a heavy loss, and that in order to increase the revenue it is proposed to abolish workmen's tickets and to withdraw concessions granted to the travelling public a year ago—concessions in the shape of extensions of stages.

South Africa.—ELECTRIC VEHICLES.—The State Railway authorities have lately taken delivery of a fleet of nine electric motor-lorries, constructed by the General Vehicle Co., of New York; the vehicles are being used in the Cape Town district.

Southport .- The number of men from the tramway department who have enlisted is 34 out of 88. One clerk, nine conductors and one motorman left to join the army on Saturday.

Wigan .- WAR BONUSES .- By a majority of nearly two to one, Wigan tramway men have declined to accept the Coporation's war bonus offer of 2s. per head to men earning less than 35s.

week. The result of the ballot will be communicated to the Tramways Committee.

-The Special Committee that has been considering TUTK.—Ine Special Committee that has been considering the works involving capital expenditure which could be held over till after the war, has decided that the Hull Road tramways extension and the extension of the electric mains to Strensall, extension, and Naburn, and the provision of cooling-tanks at the Poppleton, and Naburn, and the provision of cooling-tanks at the electricity works, are essential, and their abandonment would involve the city in heavy financial loss.

# TELEGRAPH and TELEPHONE NOTES.

Hong-Kong.—The American Consul reports that the expert from England who is to superintend the erection of the wireless installation arrived in Hong-Kong early this year. The proposed range has been increased to 500-700 miles by day and 1,300 miles or more by night under normal conditions, and the plant is expected to be in operation within five months. The plant is expected to be in operation within five months. The inauguration of this service has some additional importance in view of the fact that the large wireless stations of the Chinese Government at Canton and Woosuug, near Shaughai, are now working, and those at Foochow and Hankow will be completed by the time the Hong-Kong station is in working order. The service of the two Chinese stations now ready was commenced at the off the two Chinese stations now ready was commenced at the beginning of the year. They cover substantially the same radius as the Hong-Kong station, the plants thus being able to exchange messages with each other as well as with all ships in Chinese waters. A typhoon warning service was one of the first features adopted by the new system.

All these coast stations, are of the same construction. The oscillating power in the antenna is 5 kw. The stations are manned by a Chinese staff trained by foreign experts in the Peking College of Communications. The Woosung station has been opened for day and night service, and the Canton station is open from 8 am to 10 p.m. The stations are supervised by managers with six to eight years' practical experience in wireless work. The charges are 5d, per word, with a minimum per telegram of 4s. 2d. Hong-Kong.—The American Consul reports that the

Illicit Wireless Apparatus. — William Thompson, described as a labourer, was charged with having in his possession wireless telegraph apparatus without the consent of the Postmaster-General at Blyth, on the 25th inst. A Post Office expert said that the apparatus could transmit messages over a radius of 5 miles the apparatus could transmit messages over a radius of 5 miles under favourable circumstances. The defendant stated that he had made electrical experiments a hobby. He was not using the apparatus as a wireless telegraph instrument; the major part was used in developing the idea of steering ships at sea from the shore. He was experimenting on this subject with a model yacht on Ridley Park lake. A second charge of stealing 26 lb, of brass was also preferred against Thompson. The defendant had taken the brass to help him in his electrical experiments. The defendant was sent to prison for six months in the second division on the first charge and for one month on the second charge, also in the second division, the terms to run concurrently.—Morning Post. division, the terms to run concurrently.—Morning Post.

Libya .- The American Consul at Tripoli reports that under the Ottoman régime land telégraphs were considerably devenuer the Ottoman régime land telégraphs were considerably devenuer in what is now the Italian Colony of Libya, 3,150 miles of wire being in existence at the end of 1910. During the war practically the entire telegraph system was destroyed, but there is now a tically the entire telegraph system was destroyed, but there is now a permanent system, extending along the coast for more than 370 permanent system, extending along the coast for more than 370 miles and inland over a zone about 55 miles wide, with a total permanent system, extending along the coa-t for more than 370 miles, and inland over a zine about 55 miles wide, with a total length of 870 miles of wire, with 24 telegraph and six telephone stations. Tripoli, the metropolis of the Colony, is still without telephonic communication for civil purposes. Some months ago telephonic communication for civil purposes. Some months ago several private firms applied to the Minister of the Colonies for a concession to install and operate a system, and on September 30th, 1914, a Commission appointed from Rome was charged with 1914, a Commission appointed from Rome was charged with has been made public. A system is maintained for Government has been made public. A system is maintained for Government needs. Before the Italian advent there was no wireless equipment examining the question, but no pronouncement as to its findings has been made public. A system is maintained for Government needs. Before the Italian advent there was no wireless equipment in this district, but after they landed 12 installations were set up to in this district, but after they landed 12 installations were set up to replace the dismantled telegraphs. The instruments are Marconi, and the type most used is the 1.5-kw. musical spark station, which, designed for car transport, has been adapted for carriage which, designed for car transport, has been adapted for carriage which, designed for car transport, has been adapted for carriage who and entirely all the telegraph lines destroyed will be rebuilt and others provided, but, being State owned and entirely constructed by State engineers, supplies will not be purchased locally but requisitioned through Rome. Firms interested in such articles who desire to enter this field should have agents in Italy in a position to interest officials charged with the purchase of telegraphic materials. graphic materials.

Russia.—Since the opening of the war the number of applicants for fresh telephones in Petrograd has fallen away by 50 per cent, and over 900 apparatus have been taken away from

Repeaters.-Writing to the Electrical old subscribers. World, the President of the De Forest Radio Telephone and Telegraph Oo. states that the trans-Continental telephone system,

New York—San Francisco, was made possible by the use of the De Forest "Audion" amplifier as a telephone relay. There are three audion repeater stations in the line.

The Telegraph and Telephone Age states that the De Forest Co. has recently developed an audion amplifier or audiphone, which is designed to relay or amplify minute pulsating or alternating is designed to relay or amplify minute pulsating or alternating electrical impulses from five times to 600 times their original electrical impulses from five times to 600 times their original rintensity, without lag or distortion. It is stated that the wire telephone and telegraph rights have been acquired by the American Telephone and Telegraph Co. Telephone and Telegraph Co.

The Telegraph Service.—At a special Conference of the Telegraphs Section of the Postal and Telegraph Clerks' Association, at Birmingham, on the 23rd inst., to consider the possible effects of the introduction of machine telegraphy, a resolution was effects of the introduction of machine telegraphy, a resolution was effects of the introduction of typists and other telegraphically unskilled persons in any of the operations of graphically unskilled persons in any of the operations of telegraphic communication was an infringement of Trade Union typinciples. Another resolution was carried suggesting that it principles. Another resolution was carried suggesting that is should be reported to the Parliamentary Committee of the Trade Union Congress that the Department was taking advantage of the war situation to employ typists at low wages on work hitherto done by telegraphists.

one by telegraphists.

The Government has declined to grant a war bonus to postal employés with salaries below £210 per annum, having decided that the rise in the cost of living is not by itself a sufficient that the present time, for increasing the wages of the employés.

United States.—New York.—The New York Telephone Co. has accepted an order of the Public Service Commission reducing Co. has accepted an order of the Public Service Commission reducing the telephone tariff throughout the city; the new rates will come into force on July 1st, and are estimated to save the public \$2,700,000 a year. The minimum charge for business and residence telephones will be 5 cents a call; and the cost of calls will depend upon the distance between the stations, the city being divided into 10 zones. It is reported that the Telefunken wireless station at Sayville, Long Island, is being increased in power from 35 to 100 kW., so that communication can be continually maintained with Nauen in Germany.

SAN FRANCISCO EXPOSITION—When President Wilson opened the Panama-Pacific Exposition by cloring an electric circuit at the White House on February 20th, the signal was carried over a telegraph wire to the radio station at Tuckerton, N.J., which is operated by the United States Navy department. At Tuckerton operated by the United States Navy department. At Tuckerton operated automatically operated a relay which set electric waves the signal automatically operated a relay which set electric waves into action and the wireless signal was instantly received at the Tower of Jewels on the fair grounds at San Francisco, causing another relay to operate. The latter relay closed circuits throughout the grounds, and on receipt of the signal the main door of the Machinery Hall was opened, and the "Fountain of Energy" at once began to play. The wireless apparatus employed was that of once began to play. The wireless apparatus employed was that of the Federal Telegraph Co., of San Francisco, which uses the Poulsen system.—Telegraph and Telephone Age. San Francisco Exposition —When President Wilson opened

Farmer & Co., Pryke & Palmer, Engineering Supplies, Ltd., Middleton Bros. M. G. Davis & Co. and Docker Bros. for supplies. of engineers' sundries to the electric lighting and tramways departments.

Glasgow.—Messrs. Woodward & Co. have secured the contract for the supply of six months' carbons to the Cleansing Committee of the T.C.

The T.C.'s Tramways Committee has accepted the offer of the

British Thomson-Houston Co., Ltd., for switchgear for Kinning Park sub-station.

Huddersfield.—The Tramways Committee has accepted tenders for stores as follows :---

Brake blocks and castings.—France & Brook, Slatthwaite, and Melton and Co., Halifax.
Cables.—W. T. Glover & Co.
Steel tramcar tires.—J. Brown & Co.

London,-L.C.C.-The Stores and Contracts Committee has accepted the following tenders during the three months ended March 31st, 1915 :-

Electric lamps, Schedule No. 17.—Edison & Swan U.E.L. Co.—Items 8 to 27 (metallic-filament lamps, drawn wire).

Electric traction glow lamps for Tramways Department (Schedule No. 17a).—Siemens Bros. Dynamo Works, Ltd.—Item 1 (standard Dutch type).

The Highways Committee has received the following tenders for the supply of rails for the construction, reconstruction and maintenance of the Council's tramways:—

#### Track Rails and Fastenings.

Estimate of Chief Officer of Tr	amw	ays £54.	532

The Committee reports that the lowest complete tender was that rune Committee reports that the devest on piece tender was that submitted by Maschinenfabrik Oerlikon of Switz rland, but in view of the difficulties which would be likely to arise in the transport of raw materials and of the completed work, and in the inspection of the machinery during manufacture, it was decided to pass over this tender. With regard to the tenders submitted by inspection of the machinery during manufacture, it was decided to pass over this tender. With regard to the tenders submitted by Fraser & Chalmers, Ltd., the Committee was advised by Sir A. B. W. Kennedy, the electrical engineer, retained by the Council to advise on the tenders, that, although they were a firm of the highest standing, they had not constructed any turbines of a larger capacity than 3,000 kW. In view of the fact that the early delivery and expects and expects on the standard of the machines were afterned to the standard of the machines were afterned to the standard of the machines were afterned to the standard of the machines were afterned to the standard of the machines were afterned to the standard of the machines were afterned to the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the standard of the stan and smooth and speedy operation of these machines were of the utmost importance for the safe working of the undertaking, it was necessary to take into serious consideration the experience which the different firms tendering had had of machines of the type and size in question. The next lowest tender was that of the British Westinghouse Co., who had supplied three of the five turbo-generators at the generating station, and had since com-pleted a further machine for the station, and acting on the advice of Sir A. Kennedy, the tender of the latter firm was accepted,

The following tenders have been received for the supply and laying of cables required in connection with an additional supply of power up to 3,500 kw., to be obtained from the London Electric Supply Corporation in connection with the working of the Council's tram ways.

Second alternative	(	**	G 4	28 R.	P.M.)	••	 2,180
Third alternative	(		E 4	28 R	P.M.)		 2.150

The engineer recommends the acceptance of the tender of the General Electric Co., for one rotary converter with Brush transformer for £1,925. As regards the Glengall sub-station, the engineer points out that the building is not suitable for rotary machines, and that it is desirable to install a motor converter which will be in line with the existing machines. He recommends the installation of Messrs. Bruce Peebles & Co.'s type A, for £2,265. The Committee has adopted the engineer's recommendations.

The following tenders have also been received, for renewing the electric lighting and heating circuits at the Council Offices, and the substitution of five 1,000-c.p. half-watt lamps in the Council Chamber :--

H. E. Keen & Co	·`•			••	(accepted)	£125
Duncan Watson & Co.	••					185
Marler & Co		••	• •			818

WOOLWICH.-The tender of Messre. Babcock & Wilcox, Ltd., at \$256, for steam piping, has been accepted by the Electricity Committee. The tender of Messrs. Seagers, Ltd., has been accepted, at £260. for a cast-iron rain-water tank required in connection with the Globe Lane extensions.

Meter Contracts.—The Electrical Apparatus Co., Ltd., have secured the following contracts:-

Cheltenham Corporation.—Single phase meters, for 12 months. Bray U.D.O.—Single phase meters, for 12 months.

Mesers, Chamberlain & Hookham, Ltl., have received contracts for the supply of meters to Cardiff, Grimsby and Hornsey.

-The Joint Hospital Board has accepted the tender of Mr. Pinto, of Ramsgate, for the maintenance of the electric bells and private telephones at the hospital.

Walthamstow. - The following tenders have been accepted by the District Council for annual supplies of electricity and tramway stores :-

W. T. Henley's Telegraph Works Co.—Cables and pure rubber tape.

General Electric Co.—Steel conduits and saddles.
Edison & Swan United Electric Light Co.—Ceiling roses, lampholders, &c.

Chamberlain & Hookham.—Meters.
General Electric Co. and Cryselco, Ltd.—Carbon-filament lamps.

Geo. Angus & Co.—Bubber insertion and packing.

The following tenders are recommended for acceptance for the supply of switchgear and cables :-

British Thomson-Houston Co.—High-tension switchgear, £891.

General Electric Co.—Low-tension switchgear, £230.
W. T. Henley's Telegraph Works Co.—Cables. Price not mentioned.

The Lighting Committee has purchased 200 tons of Shirebrook nutty slack outside contract from Hinchcliffe & Co., at 18s. 10d. per ton.

#### FORTHCOMING EVENTS.

North-East Coast Institution of Engineers and Shipbuilders.

April 30th At 7 80 p m. At Bolbec Hall, Newcastle-upon Tyne,
on "The Modern Aeroplane," by Dr. R. T. Glazebrook, F.B.S.

(Graduates' Section.)—Saturday, May 1st. At 715 p.m. Discussion on "The Making and Filing of Engineering Notes," opened by Mr. C. Ian Burrell.

Royal Institution of Great Britain,—Saturday, May 1st. At 8 p.m. At Albemarie street, W. Leosure (I) on "Photo-Electricity," by Prof. J. A. Fleming, F.R.S. At 5 p.m. Annual Meeting.

Monday, May 8rd. At 5 p.m. General meeting.

Thursday, May 6th. At 8 p.m. Leosure (II) on "Advances in General Physics," by Dr. A. W. Porter, F.R.S.

Friday, May 7th. At 9 p.m. Paper on "Electrons and Heat," by Prof. O. W. Richardson, F.R.S.

Saturday, May 8th. At 8 p.m. Lecture (II) on "Photo-Electricity," by Prof. J. A. Flemling, F.R.S.

Institution of Electrical Engineers (Students' Section).—Wednesday:
May 5th. At 7.50 p.m. At Victoria Embankment, W.C. Annual General May 5th. Meeting.

(Newcastle Local Section),—Monday, May 8rd. At 7.30 p.m. At the Mining Institute. Paper on "Phantom Circuits in Telephony," by Mr. A. W. Martin.

Salford Technical and Engineering Association.—Wednesday, May 5th Visit to Gresley Iron Works, Salford.

Junior Institution of Engineers.—Friday, May 7th. At 8 p.m. At 89, Victoria Street, S.W. Informal discussion.

Sociation of Mining Electrical Engineers (Notts, and Derbyshire Branch).—Joint Meeting with National Association of Col iery Ma. agers. Saturday, May 8th. At 8.80 p.m. At University Collige, Nottingham. Paper on "Protective Devices," by Messrs. E. Kilburn Scott and L. F. Fogarty,

#### NOTES.

Institution and Lecture Notes.—Diesel Engine Users' Association.—At the April meeting of the Association, a standard policy for insurance at Lloyd's against breakdown, which had been considered at several meetings of the Committee, was approved and adopted. This insurance includes specially advantageous terms to members of the Association, and arrangements have been made for periodic inspections of the plant, and for advice and full reports to be furnished by fully-qualified Diesel engine experts acting for the underwriters. Until this standard form was framed, no form of policy specially applicable to the Diesel engine had been in use. The forms and conditions generally used were those applicable to a gas engine, and consequently difficulties arose in the interpretation. It is hoped that the immediate offer of specially advantageous terms will lead to insurance of this plant being more generally effected, and in that case the larger volume of business done should result in still more favourable rates for insurance being obtainable within a short

time.

A discussion on the lubrication of Diesel engines was opened by Mr. H. L. Alderton, of Guildford, who dealt with the various methods of lubrication by means of ring lubricators, ordinary drip, or forced feed with pumps or centrifugal rings. Mr. Alderton emphasised the importance of carefully selecting the best oil for cylinder lubrication so as to avoid troubles from carbonisation and gumming. He said that apparently large engines required more oil in proportion to their output than the smaller engines. In the discussion it was shown that in some cases one class of oil was used throughout the engine, and in others different oils for the bearings, cylinders and compressors. The methods of filtration of oil, and the extent to which filtration was carried out, also showed a considerable amount of variation. It was decided to ask for returns from the various members of the Association giving information as to the methods of lubrication, with quantities and costs, mation as to the methods of lubrication, with quantities and costs, in connection with their plants, with a view to a further dis-

in connection with their plants, with a view to a further discussion on the subject.

The next meeting of the Association is to be held on Wednesday, May 19th. Information and particulars concerning the Association can be obtained from the acting hon. secretary, Mr. Percy Sill, at 19, Cadogan Gardens, London, S.W.

We understand that the special Diesel engine policy referred to in the above report has been drawn up by Messrs, Banks, Warner

and Co., of 11, Queen Victoria Street, E.C., who have retained as their inspecting engineers the well-known Diesel experts, Mr. Phillip N. Smith and L. W. Johnson.

Institution of Electrical Engineers.—The fifteenth annual general meeting of the MANCHESTER LOCAL SECTION was held on Tuesday evening, the 27th inst. The chairman (Mr. P. P. Wheelwright) precided. The annual report was read and approved; the membership was 732, a considerable decrease on last year's figures. The voting for the officers and Committee resulted as follows, viz.:— Chairman—Mr. B. Welbourn

Vice Chairmen.—Mesar. D. J. Beaver and A. E. McKenzie.
Hon. Sec. and Treasurer.—Mr. Julius Frith.
Committee—Prof. A. B. Field; Mesars. H. Allcock, C. C. Atchison, A. P. M. Fleming, W. Cramp, S. L. Pearce, J. S. Peck, H. D.
Symonds, H. A. Ratcliff, J. A. Robertson, S. J. Watson and Mr.
Alderman Walker.

Votes of thanks were accorded to the chairman and hon, secretary for their services during the year, also to the Committee of the Engineers' Club for allowing the use of the room for holding the meetings. At the conclusion of the meeting, Mr. A. Dickinson's paper on the Bombay hydrc-electric scheme was read by Mr. E. S. W. Moore, in the unavoidable absence of Mr. Dickinson owing to indisposition.

Association of Electrical Station Engineers,-A meet-Association of Electrical Station Engineers.—A meeting representative of the station and mains engineers of Greater London was held under the auspices of the A.E.S.E. London Brauch, on April 27th, at Stone's Restaurant, Ludgate Hill, E.C. Two letters which had been received by the A.E.S.E. Committee were brought forward for the consideration of the meeting: One from the Electrical Trades Union London District Committee were the A.E.S.E. London Committee were the A.E.S.E. London District Committee were also and the A.E.S.E. London District Committee were also and the A.E.S.E. London District Committee were also and the A.E.S.E mittee, inviting the A.E.S.E. London Committee to a conference "To consider if steps can be taken to secure an advance of wages in view of the abnormal circumstances now prevailing"; the other from the Associated Municipal Electrical Engineers (Greater London) which when the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the London), which asked for two or three dates when it would be convenient for the proposed conference. This conference was originally asked for by the A.E.S.E., on February 9th, 1914, but had not been held owing to a difficulty in finding convenient dates.

After a lengthy discussion, the meeting unanimously agreed that the London Committee should meet both convenients.

that the London Committee should meet both organisations in conference with the ultimate object of an increase in wages.

Institution of Civil Engineers.—The Council has made the following awards for papers read and discussed during the session 1914-15:—The Telford Gold Medal to Mr. A. L. Bell (Rosyth); Telford Premiums to Mr. C. W. Anderson (Chakradharpur, India); Sir Thomas Mason (Glasgow); Dr. H. F. Parshall (London); and Mr. H. E. Yerbury (Sheffield); and the Crampton Prize to Mr. F. D. Evans (Kuala Lumpur, F. M.S.). The awards for papers to be published in the *Proceedings* without discussion will be announced later.

Electric-Light Switching Competition.—Those who are interested in the use of special tumbler switches for the control are interested in the use of special tumbler switches for the control of glow-lamp and other consumption circuite, and who wish to improve and afterwards test their knowledge of the subject, would be well advised to consult the issues of our contemporary Electricity during the month of May. This journal is holding the next of the competitions organised by Messrs. A. P. Lundberg & Sons, which have now become a regular feature of the electrical year; money and book prizes and certificates will be awarded to successful competitors. The subject of electric light switching is well working attention on the part of all who are in any way concerned with petitors. The subject of electric light switching is well worth investigation on the part of all who are in any way concerned with lighting installations.

Wireless Control of Public Clocks.—Writing on the subject of Mr. Ball's suggestion to check the performance of public clocks by wireless reports, in the Horological Journal for March, Mr. F. Hope-Jones questions whether the trouble and expense involved are worth the results achieved, and suggests that a simple receiving apparatus should be installed at each clock with which the caretaker could note the time signals from Paris. In this case no licence for transmitting signals would be required, and the ether would not be filled with untruthful time signals.

Mathematical Notation .- In order to facilitate the compositor's task in the setting-up of articles in which vector symbols occur, especially in concrete expressions, where modulus and argument are both required, Mr. F. Jacob, M Inst.C. E., suggests the use of the dagger "†" inverted for positive, erect for negative argument, between modulus and argument.

Thus,  $\theta = \theta + \theta$  for  $\theta = \theta + \theta$  for positive values, and  $\theta = \theta + \theta$  for

negative values of  $\theta$ . A numerical example, 1.72+13° 36′ illustrates the advantage

The point of the dagger follows the usual convention for + and direction.

Mr. Jacob points out that we have a very apposite precedent in which, for the purpose above-mentioned, replaces the original factorial symbol | n.

Electric Vehicle Tire Guarantees.-In view of the fact that the "Ring" of solid tire manufacturers has decided in future on'y to guarantee such tires for a service of 10,000 miles within a period of 12 months, Messrs. Edison Accumulators, Ltd., have decided to undertake full responsibility of guarantee of all all solid tires coming within this category will be guaranteed for a service of 12,000 miles within a period of 15 months. This decision is based on their experience of the superior qualities of the electric vehicle, both in this country and the United States, in the matter of increased mileage on tires of such vehicles.

Central Station Men and Recruiting.— In the House of Commons on Tuesday, Mr. Touche asked the Under Secretary for War whether he was aware that many men formerly employed in the electrical services in the metropolis had joined the Forces; that others were desiring to join and, owing to the technical and expert training required, their places could not readily be filled, and there was some risk of the power stations, the output of which was largely used for Government purposes, becoming insufficiently manned; that representations had been made, at the instance of the general officer commanding the London district, of the importance of preserving the efficiency of electric and power services of the metropolis, but in the absence of some public service or other badge authorised by the Government, which could not be forged, to protect the men from reproach for not enlisting, it was difficult to persuade them to remain; was he aware that proposals submitted by the Association of Municipal and Electrical Engineers of Greater London had not resulted in any satisfactory solution of the difficulty; and would he consider the question of either authorising the issue of an officially recognised public works badge, or of enlisting the men employed in approved public utility services in a special volunteer body authorised to wear uniform, as in the case of the Civil Service Corps?

Mr. Tennant: Recruiting officers have instructions not to enlist skilled employés of electrical services without the ranction of the askilled employés of electrical services without the ranction of have applied for War Office badges, have been offered such badges

skilled employés of electrical services without the ranction of their employers. I am informed that several electrical companies, who have applied for War Office badges, have been offered such badges for i-sue to men of recruitable age who would be willing to enlist if called upon in the event of emergency, or of their ceasing to be urgently required in their present employment.

Mr. Touche: Are these official badges what I call War Office badges?—Mr. Tennant: Yes, they have been offered these badges.

Mr. Touche: Official badges?—Mr. Tennant: Yes.

Mr. Terrell wanted to know how these badges would differ from these given to persons engaged upon munitions of war.

Mr. Terrell wanted to know how these badges would differ from those given to persons engaged upon munitions of war.

Mr. Tennant pointed out that the badges for makers of munitions of war exempted the wearer from all war service, inasmuch as he was helping to produce the munitions of war. The other badges would not in all cases exempt a man from military service, and in the case of emergency arising he would be called upon to serve, unless he were urgently required in his present employment.

Mr. Terrell: Are two classes of badges issued, and to whom is application to be made for these badges?—Mr. Tennant: When the hon, gentleman says there are two classes of badges, that is not so. This has been offered and has not been accepted. We are prepared to issue it. Application should be made to the secretary to the War Office.

War Office.

Mr. Touche: Is it a condition of the issue of the badge that the man who receives it shall give an undertaking to join the Colours if called upon to do so?—Mr. Tennant: That is so.

The matter then dropped.

Australian Association of British Manufacturers. —The annual general meeting of this Association was held at the Commercial Travellers' Club, Melbourne, on Friday, February 26th. The chairman, Mr. Geo. Shrimpton, submitted the annual which stated, amongst other matters, that the membership had now increased to 238, being 120 British manufacturers and 118 representatives of British manufacturers. During the year a Sydney branch of the Association had been formed, and a Sydney Council had recently been elected. The Executive Council were pleased to be able to report that under the new Tariff a greater pleased to be able to report that under the new Tariff a greater measure of preference had been granted to goods of British origin. This matter had been strongly urged by the Association since its formation. A list of those items which received an increased measure of preference, numbering 352, was printed with the annual report. The following members were elected as members of the Executive Council for the ensuing year:—

President.—Mr. Geo. Shrimpton (Geo. Shrimpton & Sons).

Vice-President.—Mr. C. W. U. Adamson (Baboock & Wilcox, Ltd.)

Ltd.).

ouncillors.—Mr. F. A. Daniel (H. S. Ingamells & Co.); Mr. John D. Campbell (Alexander Fergusson Pty., Ltd.). Councillors.

Hardware Councillor.—Me. W. H. MacLennan. Electrical Councillor.—Mr. G. L. Just (Edison & Swan United

Electric Light Co., Ltd.).

Members urged that the Association should take steps to guard against the possibility of any reduction of the increased preference granted to goods of British origin, which might be suggested as a result of agitation on the part of importers of American and other foreign goods. The chairman assured members that the matter would receive the fullest attention of the Executive Council, and that any members wishing for a sistance could rely on the fullest co-operation of the Association. The question of duty on catalogues was discussed, and keen disappointment was expressed that the Government had increased the rate of duty. The chairman advised members that the Association was still urging the reduction of this duty, and a letter on the subject, addressed to the Minister of Trade and Customs, was read and approved of by the meeting.

For Sale.—The whole of the electrical apparatus used in lighting the Liverpool Exhibition is to be sold by auction by Messrs. P. Huddleston & Co., on May 12th, at the Exhibition Buildings. Particulars are given in our advertisement pages to-day.

Sydney Electricians.—An Australian newspaper states that the labour market in Sydney is decidedly satisfactory, so far as electricians are concerned. Fitters and mechanics with a know-ledge of local requirements are in demand, particularly at Garden Island and the Public Works Department.

More Gas.—We notice in the pages of a provincial contemporary, devoted to the gas interests, an advertisement which purports to illustrate the interior of the gas equipped kitchen of the First Eastern R.A.M.C. Hospital, at Cambridge. Everything appears to be spick and span, including the chains and cooks of the gas lamps. However, it happens that the whole of the hospital is electrically lighted by the Cambridge Electric Supply Co., whose wiring department supplied and fixed all the wiring, together with electric sterilisers in the operating theatre and a motor-generator for X-ray apparatus, and by a regrettable oversight a tumbler switch still remains on the illustration. The illustration bears the legend: So-and-So's gas-heated cooking apparatus installed at the First Eastern B.A.M.C. Hospital, Cambridge—the gas lighting, which is not there, being apparently thrown in to avoid the injury to the feelings of the reader of the paper, which an electrically illuminated kitchen would no doubt cause. By a coincidence, a letter appears on the facing page, headed "Abuse of Advertisements"!

Appointments Vacant.—Two assistant storekeepers, age 25-40 (£250) for Nigerian Government Posts and Telegraphs Department; engineers-in-charge (£120) for Newport Corporation; junior engineers, age about 21 (25s. plus war allowance), for Cleveland and Durham Electric Power, Ltd.; junior assistant electrical engineers for the Newcastle-upon-Tyne Electric Supply Co., Ltd. (15s). Particulars are given in our advertisement pages.

Inquiries.-Makers of the "Cordless system of heating, as used for irons," and of the Mitchell electric hair-drier, are asked

### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Stafford T.C. has decided that Ms. W. H. Robins shall be appointed engineer and manager of the electricity works; and Ms. W. M. Valon, as secretary for the

works.

The Aylesbury U.D.C. has appointed Mr. H. H. Sutcliffe, of Hempton Bridge, as assistant electrical engineer.

MB. C. CLARE ATCHISON, Rochdale borough electrical engineer,

who has been on the sick list for some considerable time, has now resumed duty.

Tramway Officials.—Mr. T. C. WINFIELD has been appointed works superintendent of the West Ham Corporation Tramways. Mr. Winfield formerly held a similar position under the Metropolitan Electric Tramways Co. There were 127 applicants for the vacancy.

General.--After serving as chairman of the Croydon General.—After serving as chairman of the Croydon Lighting and Electricity Committee since 1897, when it was formed, ALD D. B. MILLEE, J.P., has resigned, under medical advice. Ald Miller was chairman of the General Purposes Committee in 1890, when an application for a provisional order for electric lighting was decided upon. The Byrough Council, on Monday assessed a receiving and the committee of the council or the council of the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the council or the counci Monday, passed a resolution recording appreciation of the very valuable services of Ald. Miller, and the fact that he leaves the Council electricity undertaking in a state of high efficiency.

COUNCILLOB WHITESIDE and COUNCILLOB MABPLE have been appointed chairman and vice-chairman respectively of the Stretford Electricity and Tramways Committee.

It is announced in the Press that SIE ALEXANDER KING, late secretary to the Post Office, has been elected a director of the West India and Panama Telegraph Co., Ltd., in place of the late Sir John Lamb.

#### NEW COMPANIES REGISTERED.

East Lancashire Electrical Co. (Accrington), Ltd. (140.029).—This company was registered on April 21st, with a capital of £1.000 in £1 shares, to carry on the business of electric, silver or nickel platers and polishers, electric light and power engineers, makers of electric cooking and heating apparatus and machinery for electrical, mechanical and textile purposes, dealers and makers of all kinds of motors and motor-car appliances and accessories, etc. The subscribers (with one share each) are G. W. Somerville, "Roseneath," Owen Street, Accrington, electrical engineer; F. G. Clarke, 99, Stanhill, Oswaldtwistle, electro plater and polisher. Private company. The number of directors is not to be less than two or more than five; the first are G. W. Somerville and F. G. Clarke, Qualification £23. Solicitor, F. G. Lupton, 11, Dutton Street, Accrington. Registered office: Paradise Street, Accrington.

Ardee Electric Co., Ltd (4,235).—This company was registered in Dublin on April 22nd, with a capital of £5,000 in £1 shares, to acquire and carry on the business of an electric light, heat and power producer, generator and distributor, etc., carried on by J. W. McKeever, J.P., at Ardee, Co. Louth. The subscribers (with one share each) are J. W. McKeever, Aclare Lodge, Ardee, Co. Louth, farmer; T. W. Storey, Ardeevin, Bailey, Co. Dublin, A.I.E.E., C.E. Private company, J. W. McKeever is the first director. Qualification, 50 shares. Registered office: Ardee, Co.

#### OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Charing Cross, West End and City Electricity Supply Co., Ltd. (29,122).—Capital £2,100,000 in 130,000 pref., 130,000 ord., 80,000 City Undertaking pref., and 80,000 City Undertaking ord. shares of £5 each. Return dated March 18th, 1915. 80,000 pref., 80,000 ord., 80,000 City Undertaking pref., and 70,000 City Undertaking ord. shares taken up. £1,200,000 paid on the pref. ord. City Undertaking pref.; £350,000 considered as paid on the City Undertaking pref.; £350,000 considered as paid on the City Undertaking ord. Mortgages and charges, £1,087,178.

W. T. Henley's Telegraph Works Co., Ltd. (13,795).—Capital £400,000 in 40,000 pref. and 40,000 ord. shares of £5 each. Return dated April 2nd, 1915. All shares taken up. £5 per share called up on 39,880 pref. and 32,616 ord.; £362,480 paid; £37,520 considered as paid on 120 pref. and 7,384 ord. Mortgages and charges, £150,000.

Direct Spanish Telegraph Co., Ltd. (6,732).—Capital, £95,000 in 13,000 ord. and 6,000 pref. shares of £5 each. Return dated April 1st, 1915. 12,931 ord. and 6,000 pref. shares taken up; £94,655 paid. Mortgages and charges, nil.

Notting Hill Electric Lighting Co., Ltd. (25,921).—

Notting Hill Electric Lighting Co., Ltd. (25,921).—
Capital £201.352 10s. in 17.002 non-cum. 6 per cent. pref. and 2.998 cum. 6 per cent. pref. shares of £10 each, and 27,050 ord. shares of 1s. each. Return dated March 9th, 1915. 11.402 non-cum. pref., 2.998 cum. pref., and 27,050 ord shares taken up: £145.352 10s. paid. Mortgages and charges, £64,000, and jointly with the Kensington and Knightsbridge Electric Lighting Co., Ltd., a further £231,500.

Telephone Co. of Egypt, Ltd.—A memorandum of satisfaction to the extent of £1,300 on April 14th, 1915, of deb. stock, covered by deeds dated from July 27th, 1904, to October 27th, 1909, securing £200,000 has been filed.

Waste Heat and Gas Electrical Generating Stations, Ltd. (91,738).—Capital £350,000 in £1 shares. Return dated March 24th, 1915. 920,000 shares taken up; £920,000 paid. Mortgages and charges, nil.

#### CITY NOTES.

#### Anglo-Portuguese Telephone Co., Ltd.

Mr. Herbert Allen presided at the London Chamber of Commerce, on Friday, over the annual meeting. He said it was unnecessary to dilate at any length on the accounts, which, as regarded the profit and loss, presented no particular feature. There was what they had come to regard as the customary growth in gross income, but the increase in net profits was not quite commensurate with the increased revenue. A large additional staff was engaged last year for the company's new exchange in the North of Lisbon, but the actual opening of the exchange did not take place until after the close of the year, so that they had the additional expense without a corresponding increase of income, and it might be said that about year, so that they had the additional expense without a corresponding increase of income, and it might be said that about £20,000 of last year's capital expenditure was only just beginning to be productive. It was partly in anticipation of this that he thought he ought last year to prepare them for a possible temporary set-back in their dividend, especially in view of the recent increase in the share capital; but, happily, the board had not felt it necessary to encroach upon the usual distribution of 8 per cent. On their new exchange this year they anticipated having a considerable accretion of business with but a moderate addition to their expenses. At the same time, there was no gainsaying the tendency, not only with this company, but with most of the telephone enterprises, to have to lay out more money and do more work than formerly for a given return. Mr. Gill, the company's consulting engineer, had recently visited Lisbon and was well satisfied with the condition of their three exchanges there. With regard to the balance sheet, the only item calling for attention was the reduction of sundry creditors from £28,774 to the more normal level of £13,525. The completion of the with the condition of their three exchanges there. With regard to the balance sheet, the only item calling for attention was the reduction of sundry creditors from £28,774 to the more normal level of £13,525. The completion of the North Exchange was the most important work of the year, and accounted for £19,542 of the total capital expenditure of £27,229. The switchboard of the new exchange was of the latest type, being known as the No. 1 relay common battery of the Western Electric Co. It was already fitted for 1,800 subscribers, and had an ultimate capacity of 6,000, so that, although the district served by the new exchange was rapidly extending, its telephone needs for many years to come were amply provided for. They had partly carried out the programme foreshadowed at the last meeting with regard to the question of depreciation. Instead of continuing to build up indefinitely what in the balance sheet was, perhaps, somewhat misleadingly, called the reserve fund—which was liable at any time to be appropriated to a reduction of capital expenditure or written off for depreciation—they were inclined in future to write off depreciation year by year. The 1913 accounts closed with a reserve of £55,000, and £30,000 of this they had since appropriated to a reduction of capital expenditure, from £290,355 to £260,355. That left them with an unappropriated reserve of £25,000, and this sum added to the renewals fund they considered ample to cover any further depreciation. Largely arising out of the political situation of Portugal, which was anything but satisfactory, there had been a further rise in the premium on gold. Fortunately, however, their remittances were protected by bills which they had bought ahead, and this was shown by the fact that although the exchange on London at the end of the year had declined to 36d., they were still remitting at 44d. per escudo. In order to protect themselves as far as possible against any further fall in exchange, they had recently bought bills enough to cover their remittances for

tions in Portugal at the present time were so unsettled they were not reflected in the business of the company, which was continually expanding, and there was no falling off in the demand for telephone facilities. But now that the North Exchange was completed and paid for they ought to be able to meet this demand for some time to come by a very moderate expenditure of capital. That being the case, and having successfully got through what he might perhaps call their financial transition of 1914, there seemed no reason why they should not be able to look for a continuation of what had come to be regarded as their normal 8 per cent. dividend. This, however, was largely a question of the course of exchange.

Mr. F. Kerr seconded the motion and it was carried.

#### Willans & Robinson, Ltd.

The directors report that the accounts for 1914 show a net profit of £17.058, after payment of debenture interest, provision for depreciation of plant, machinery and stocks, and the proper upkeep of Queen's Ferry Works. These latter have been utilised by the Government in connection with war requirements since August last. Warrants will be issued covering dividends on the "A" and "B" preference stocks, and interest on outstanding funding certificates. A dividend at the rate of 10 per cent. is recommended on the ordinary shares, leaving a balance of £9,108. Of this sum it is proposed to carry £7,431 to the reserve fund, which will thus exceed the minimum provided for by the Articles, and to distribute the balance, £1,677, among the holders of "B" preference stock and ordinary shares in manner provided for in the Articles. In common with those engaged in engineering work similar to that of this company, the outbreak of war largely disturbed the company's usual business, but the directors are glad to report that they were able to be of early service to the Government, and are now largely engaged in that direction. This latter work, though partly undertaken towards the end of 1914, is not reflected in the accounts now submitted. A large number of the company's staff—both from works and offices—having joined H.M. Forces, arrangements were made for substantially nssisting their dependents and for re-employment after the war. The number so far serving represents over 20 per cent. of the total male employés. During the year the directors accepted, with regret, the resignation of Mr. Leslie Robertson, and subsequently appointed Major P. M. Peters to the vacancy thus created. As the former would have been the retiring director at this period, it falls to Major Peters to retire, who, being eligible, offers himself for re-election. Mr. G. W. Anderson proposes to retire at the annual general meeting, and the shareholders will be asked to leave to the directors the question of appointment to fill the vacancy.

#### Indian Electric Supply and Traction Co., Ltd.

The annual meeting was held on April 22nd at the offices, Orient House, New Broad Street, E.C. Mr. J. G. B. Stone, who presided, said that the directors were glad in these times to be able to record further expansion of the company's business. The net revenue had risen from £10,161 to £12.724, and the balance carried forward to the new year's working was £7,365, against £5,226 in 1913. Interest charges had risen from £3,600 to £3,855. The street lighting contract alluded to at the last general meeting had augmented the income this year and considerable extensions were now being put in hand. The past year had been a notable one, but as far as could be ascertained the progress of the undertaking had not been materially affected. Where there had been any set-back caused by the war, it had been offset by increased sales to customers to whom the war had brought increased business. There was no material change in the tramway position, and they could not hold out any immediate prospect of improvement; but as the supply side of the undertaking continued to grow, their interest in the tramway became of less importand the amount received per unit was 1'86d. The higher price ance. Generating costs had fallen from 1d. to .83d. per unit, of coal had been more than offset by the increased efficiency of the plant, so that although they paid 14 per cent. more for coal there was a fall in the coal cost from .58d. to .46d. per unit. The board sincerely regretted that Mr. Cruickshank should have found it necessary through ill-health to retire. In his place they had been fortunate in securing the assistance of his partner, Sir George Sutherland, who was well acquainted with Cawnpore and the business. He (the Chairman) had particular satisfaction, in these times, in asking them to approve the increased dividend which, one felt, indicated the progressive nature of a business of this character when once it was firmly established.

Mr. K. A. Scott Moncrifeer, in seconding the motion, said

Mr. K. A. Scott Moncrieff, in seconding the motion, said that at the last meeting he ventured to forecast considerable improvement in their working costs, and the figures for the year showed that he was quite justified. The growth of the business made it difficult to compare one year with another, as the output had been so largely increased. The actual result, however, might be explained in this way—they had sold 33 per cent, more units last year, and to do that they spent only 6 per cent, more on coal, in spite of a rise of 11 per cent, in coal prices. The extra units sold had resulted in an increase in the revenue of £3,679—a 22 per cent, increase, while the increase in the total costs at Cawnpore was only

8 per cent. The results of their increased operations in the field of power supply was that the average receipt per unit had fallen, but the average profit per unit was practically stationary—1.03d. as against 1.05d. in the previous year. The one feature in considering those results was that of the demand upon their plant. Last year they had used 12 per cent. more of the plant in order to sell 33 per cent. more current. There had been an increase of 14 per cent. in the connections during the year, very largely in the way of motors for power purposes; 13 motors, having an aggregate of 220 H.P., had been added to the mains during the year. Another feature of the year was that the street lighting which they did under contract had been extended, and within the last few months further extensions had been arranged for. The additional lamps last year were 600, and they had in view some 1,300 or 1,400 more. He believed that they had a large field before them for the development of the industrial power supply of Cawnpore, and it was quite possible that the extension of the boundaries of the city might later on lead to a paying proposition for the extension of the tramways. They had no technical difficulties whatever; all they had to do was to keep their plant in order and extend the mains. They could see room for a reduction in working costs and a saving of losses in the mains which, without any increase of business, would give them some increase of profit in the current year.

The report was adopted.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—A dividend for the quarter ended December 31st last of 2s. 6d. per share is recommended, together with a bonus of 4° per share, payable, free of income-tax, on the 12th prox., making 7 per cent. for the year.

Brisbane City Electric Light Co., Ltd.—The directors' report for the year ended January 31st, 1915, states that, after making additions to the franchise and purchase sinking fund, and renewals, replacements and contingencies account, and reserve fund, there remains a credit balance of £20,637. An interim dividend, with dividend duty in September last, amounted to £8,205, and a further dividend of 3 per cent. on the preference shares and 7½ per cent. on the fully-paid ordinary shares, and 7½ per cent. on the contributing shares, together with the dividend duty, will absorb £12,383, leaving £1,316 to be carried forward.

Dudley and Stourbridge and District Electric Traction Co., Ltd.—The total revenue for 1914 was £50,780, compared with £52,843. It is proposed to pay 1 per cent. for the year on the ordinary shares, carrying forward £851.

Wolverhampton District Electric Tramways Co., Ltd.—The revenue for 1914 was £28,359. The directors propose to pay a dividend of 1 per cent. per annum on ordinary shares, leaving to be carried forward £386.

Southport Tramways Co., Ltd.—The report states that the total revenue, including £106 brought forward, amounted to £17,142. After deducting all expenses, including £5,573 payable to the Corporation under agreements, in addition to £1,053 for maintenance and a provision of £500 for renewals, there is a balance of £650. The directors recommend (says the Financier) that £500 be placed to reserve, leaving £150 to be carried forward.

Nairobi Electric Power and Lighting Co., Ltd.— Extraordinary meetings are to be held on May 5th and June 3nd, says a financial daily, to consider a resolution converting the preference shares into ordinary shares as from June 30th, 1915, in consideration of a bonus of 12} per cent, being paid in fully-paid ordinary shares or cash at the option of the company.

O. C. Hawkes, Ltd.—The net profits for 1914 amount to £7,714. The directors have paid 5 per cent. on preference shares, carrying forward £1,702.

Mexborough and Rawmarsh Construction Syndicate, Ltd.—The report states that the balance to credit of profit and loss account, including £119 brought forward, is £4,826. The directors recommend a dividend of 21 per cent. (free of income-tax), carrying forward £14.—Financial Times.

West India and Panama Telegraph Co.. Ltd.— The directors recommend the following dividends:—6s. per share on the first preference and 6s. per share on the second preference for the last six months of 1914, and 9J. per share on the ordinary shares (free of income-tax).

City of Buenos Ayres Tramways (1904), Ltd.— The directors have declared a dividend of 1s. 3d. per share, being at the rate of 5 per cent. per annum, less income-tax, for the three months ended March 31st.

Colombo Electric Trams and Lighting Co., Ltd.—The directors have declared a dividend of 10 per cent, free of tax, for the year 1914, carrying forward £8,010. £20,000 has been transferred to general reserve and renewals fund.

Eastern Telegraph Co., Ltd.—The directors recommend a final dividend of £1 5s. per cent., and a bonus of £3 per cent., both free of income-tax, making a total of 7 per cent. on the ordinary stock for the year 1914.

## La Plata Electric Tramways Co., Ltd.

THE directors' report for 1914 states that the total length of The directors' report for 1914 states that the total length of single track constructed and in operation during the year was 28.67 miles. The total receipts on revenue account amounted to £56,186, and the expenditure to £44,273, leaving a balance of £19.13. After providing for debenture stock and other forward, leaving £6,614. The directors regret the falling off in receipts, which is entirely due to the unprecedented depression in Argentina. In view of the necessity of husbanding the company's cash resources owing to the financial conditions caused by the European war, they recommend that the balance of £6,614 be carried forward.

son in Argentina. In view of the unprecode graduation of the company as an esources owing to the failing of the company as the present of the company to the European war, they recommend that the bisance of 26,614 be carried forward.

Mr. W. F. Hamtron, K.C., presided, on Tuesday, at Windester House, E.G., the year amounted to 26,158, accrasse of a 26,158. The total expenditure was 4 failing the amount of 2,110. The property of the company of the property of

debted to revenue, they would require to borrow money to do so, and this would be a matter of extreme difficulty, if at all possible, just now. When he last addressed them he told do so, and this would be a matter of extreme difficulty, if at all possible, just now. When he last addressed them he told them that they had under consideration the issue of some of their available debenture stock to recoup revenue and pay off their existing loan. In normal times they could have done their existing loan. In normal times they could have done so, but at present it was out of the question, so that they saw no alternative but to carry forward the balance of revenue account to next account. There were indications of an improvement in the state of affairs in Argentina, but he was afraid they could not look forward to much improved and that year. If the business of the company improved and their cash position justified it, the board would be pleased to declare and pay an interim dividend out of the carry-over.

Mr. W. T. Western seconded the motion, and the report was adopted.

was adopted.

In moving a vote of thanks to Mr. Brown, the manager, and the staff, the Chairman spoke in high terms of the work done by the manager, who, he said, had secured several concessions for the company at no cost to them, which might be of value later on

of value later on.

Mr. BOUTELL, the local director of the company, remarked that he had never known such times before in the River Plate during the 42 years he had been there, but he was certain things would gradually improve and that the company would have? of value later on. pany would benefit.

Direct United States Cable Co., Ltd.

Sir James Pender, Br., presided over the annual meeting, held on Tuesday, at Winchester House, E.C. He said that they had received the rent stipulated in the lease from the they had received the rent stipulated in the lease from the they had received the rent stipulated in the lease from the they had received the rent stipulated in the lease from the they are not and they had been exceptionally fortunate of the cable unit the very ending March 31st, 1913, they had an cables. Mr. John Varney seconded the motion, and the rewhich recommended a final dividend making 4 per cent the year, was adopted.

#### Potteries Electric Traction Co., Ltd.

Potteries Electric Traction Co., Ltd.

Mr. R. J. Howley (Chairman) presided on Monday at the annual meeting at the Electrical Federation Offices, Kingsway. He said that at the outbreak of war Mr. G. F. M. Cornwallis West was recalled to the Colours, and later, for private reasons, intimated that he had decided to resign the chairmanship of the company. Mr. West had for many years ably directed the fortunes of the company as chairman, and they all regretted his resignation and wished him a safe return. At the time Mr. West had to leave, the company was actively negotiating with the Stoke Corporation for an extension of the dates at which the tramways within the borough could be purchased, and as he had been associated with Mr. West in the negotiations he was asked to join the board. With regard to the accounts, a little explanation was recessary owing to the inclusion in the receipts and expenses of the omnibus services, which made a comparison with last year's accounts of little value. In the revenue account the traffic receipts had risen from £109,924 to £115,082, an increase of £5,158. The increased revenue brought in by the omnibus services amounted to £9,947, so that the tramways action showed a decrease compared with last year of £4,789. This was most disappointing, and was wholly attributable to the war, as at the beginning of August the tramways were doing better than ever before, and showed an increase of some £2,000. Parcel receipts, which were this year shown in a different form, amounted to £1,325, and represented net receipts, which, as compared with last year, was an increase of £131. Advertising receipts showed a slight decrease, due to a rearrangement of the business with their contractors. On the other side of the accounts, power and running expenses showed an increase from £33,628 last year to £41,973 this year, and this was due to the inclusion of the cost of working the motor omnibuses. When the war broke out the directors took immediate steps to reduce the tramway expenditure, and to a large took immediate steps to reduce the tramway expenditure, and to a large extent had been successful. He did not propose to split up the various figures between the tramways and the omnibuses, as it was not, he thought, in the interests of the shareholders, but they might take it that between August and the end of the year the saving on the tramway side of the business was nearly £2,000. The saving was really greater than it appeared, because earlier in the year an increase had been granted in wages to the employés, and this increase affected to some extent the saving made in the second half of the year. Administration and general expenses showed an increase from £10,232 to £11,009, to some extent accountable by the omnibus business, whilst the negotiations with the Stoke Corporation had necessarily increased the legal expenses. At the outbreak of the war the British Electrical Federation, of which they were members, took steps to care for the wives and dependents of the employés of the federated companies called up for service. A fund was established, called the British Electrical Mutual Aid Fund, to which the employés contributed weekly, and the amount so subscribed was doubled by the subscription of the company. The fund was distributed by a local committee in London, and it had been a complete success. The company also associated itself with the other companies in a joint contribution of £1,500 to the Prince of Wales' National Fund, £250 to the Belgian Relief Fund, and £100 to the British Red Cross Fund. With regard to the capital account, the only point was the new expenditure during the year amounting to £12,072. Of this £8,608 was incurred in connection with the establishment of the motor omnibus branch of the business, and the remainder on small works of improvement incidental to every undertaking. For the time being this expenditure had been financed from the fund set aside for renewals and general reserve, but this arrangement was only temporary, and before long further capital must be raised, both for to every undertaking. For the time being this expenditure had been financed from the fund set aside for renewals and general reserve, but this arrangement was only temporary, and before long further capital must be raised, both for releasing the renewals fund and to provide for the doubling of portions of the line and the provision of new rolling stock which would be necessary if the negotiations with the Stoke Corporation proved successful. Including £10,000 set aside for renewals, the fund available for distribution amounted to £36,571, as against £39,074 last year, a decrease of £2,501. In view of the prolongation of the war through the current year, and the necessity for the company to husband its resources, the directors thought it wise to reduce the dividend on the ordinary shares from 3½ per cent. to 2½ per cent., and to carry forward an increased amount. £10,000 was set aside for renewals, which amount set aside each year over a term of years should be sufficient to keep the tramways going in an efficient condition. The amount allocated to general reserve had been increased, which was a prudent course in the present circumstances of the company. With regard to the negotiations with the Stoke Corporation, their undertaking was subject to the usual tramway terms, and became purchaseable in 1917-18. Naturally, towards the end of a term the undertakers were unwilling to incur fresh obligations and carry out improvements, and he was glad to say the Corporation had recognised the difficulty. The points under discussion were the postponement of the date of purchase to 1940, the expenditure of a maximum sum of £35,000 on improvement, and the payment of £2,000 on wayleaves, and he hoped a satisfactory solution would be arrived at. The company had expended between £700,000 and £800,000 on the undertaking for the public service with little profit to itself, and they were entitled to some consideration from the public and they were entitled to some consideration from the public

authorities and the protection of their property from direct competition. During the year the motor 'bus services had been worked under great disadvantages. Owing to the difficulty of obtaining delivery the full fleet of 14 'buses was only completed in August, just as the war broke out, and new routes had to be surveyed and services arranged. All this preliminary work took time, and services arranged to the surveyed that the services arranged to the surveyed that the services arranged to the surveyed that the services arranged to the surveyed that the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services are surveyed to the services work took time, and it was not until the autumn that the service was established. The result of the working till the end of the year was little or no profit, but a considerable amount of experience had been gained, and the board were satisfied that it would in future prove a valuable adjunct of the business the business.

Mr. S. Mear seconded the motion, which was carried without discussion.

#### Indo-European Telegraph Co., Ltd.

The directors report that in consequence of the state of war between Great Britain and Germany, the German section of the company's lines has been interrupted since July 31st, 1914. The question of re-establishment of the company's through route at the earliest possible moment is engaging the board's earnest attention. Owing to existing arrangements with other companies, the receipts derived from telegraphic traffic for the year have been maintained. The state of war has also put an end, for the time being, to practically all experimental work on wireless telegraphy, and the development of the Galletti system previously referred to has been accordingly suspended. The company's revenue from message account and other sources amounts to £189,384, an increase of £16,852. The expenses are, on commercial and general account, £59,856, and on maintenance account £28,540, making a total of £88,395, as against £91,441 for 1913, a decrease of £3,046. The revenue account, therefore, shows a balance of £100,988, which is carried to profit and loss account, 1914, and after deduction £88,330, as against £91,441 for 1913, a decrease of £3,046. The revenue account, therefore, shows a balance of £100,988, which is carried to profit and loss account, 1914, and after deduction of income tax paid is reduced to £91,631. Adding the balance brought forward of £6,461, there is a total of £98,092. Deducting £25,000 provided for investment fluctuations, and the interim dividend of £10,625 already paid, there is available for distribution £62,467. The directors now recommend a dividend for the six months ending December 31st, 1914, of 17s. 6d. per share (making with the interim dividend already paid 6 per cent. for the year) and a bonus of 20s. per share, both free of income tax. They also propose to provide £10,000 for wireless and other technical development work, carrying forward £20,592. They propose further to make a special distribution to the shareholders of £12,750, equivalent to 15s. per share, out of interest upon certain investments and advance accounts. This distribution also will be free of income tax. The names of Herr Koehler as German official director, and of Herr Carl Joerger, Berlin, have been removed from the directorate. The directors propose to alter the minimum and maximum numbers of directors, now fixed by the Articles at 8 and 18 respectively, to the more convenient numbers of 5 and 10. and 10.

The annual meeting was held yesterday.

#### Calcutta Tramways Co., Ltd.

The annual meeting was held on Tuesday at the offices, 1, Queen Victoria Street, E.C., Sir Henry Kimber presiding. The Charman said that the additions to the capital expenditure during the year had been £18,000 for additional rolling stock. On the other hand, capital had been credited with £8,100, the cost of some Lancashire boilers which were purchased in 1910 and 1911, and which had now been superseded by far superior equipment. The loss of £8,100 on the transaction had been taken from depreciation account. which chased in 1910 and 1911, and which had now been superseded by far superior equipment. The loss of £8,100 on the transaction had been taken from depreciation account, which account, however, had been increased by their having taken £15,000 out of the past year's profits, which brought the fund up to £80,000 as against £65,000 at which it stood a year ago. They had expended about £44,000 more on capital account than they had received, but having their depreciation fund and sufficient cash resources, they felt that that was a very small sum to have overspent themselves by. With regard to the earnings, last year the Ghairman told them that they had then earned £10,000 more than in the previous year, which was a record. For several years past their earnings had been on the up grade, but last year, owing to the war, the increase was only £1,032. Up to the time of the war they were still on the up grade, as they had made £9,000 more gross profit than at the corresponding period of 1913, but the war turned the tide, with the result he had indicated. It was remarkable that the war should have had such a transcendent effect upon India, but there it was, and he thought they had great reason to be thankful that in the end they had been able to beat the best previous year's earnings by £1,000. They were paying the same dividend as last year—9½ per cent., free of income tax. The down-grade, he was sorry to say, still continued, although not to such an extent as gave rise to any fear as to the result of the year. Up to the present their receipts were really magnificent—1.151,756 rupees, which was only 71,000 rupees less than at the corresponding period last year.

Mr. J. G. B. Stone seconded the motion, and the report was adopted.

was adopted.

## Cuba Submarine Telegraph Co., Ltd.

Cuba Submarine Telegraph Co., Ltd.

The total receipts for the year ended December 31st last were £38,245, and the expenses were £16,702, leaving £21,542, plus £7,849 brought forward. £3,000 has been placed to the reserve against loss on investments, £2,500 to the pension fund, and £2,000 added to the general reserve fund, which now stands at £100,000. Interim dividends were paid on October 22nd, viz., at the rate of 10 per cent. per annum, less income tax, on the preference shares, and at the rate of 5 per cent. per annum, free of income tax, on the ordinary shares. These interim dividends absorbed £7,000, and leave £14,891, out of which final dividends at the same rates, making total dividends for the year of 10 per cent. on the preference shares, less income tax, and 5 per cent. on the ordinary shares, free of income tax, are to be paid, the balance, £7,891, being carried forward. Mr. J. P. Hooper has been appointed a director in the place of the late Mr. Robert Kaye Gray, whose death occurred on April 28th last year.

Annual meeting: May 5th.

#### Berlin Elevated and Underground Railway Co.

The report of the Gesellschaft für Elektrische Hoch und Untergrundbahnen, of Berlin, states that an increase in the receipts took place in 1914, in consequence of the inclusion for the whole of the year of the contributions made towards the working expenses of the new connecting lines operated by the working expenses of the new connecting lines operated by the company, as compared with a similar period of only three months in the previous year. Down to the occurrence of the war the traffic, especially on the new lines opened in 1913, developed in a satisfactory manner, but after the mobilisation changes in the traffic and working conditions were manifested. It was possible in general to maintain the services by securing substitutes for the men who were called to the Colours. The sum of £15,000 was appropriated from the fund for extraordinary expenditure for the purpose of granting war relief. The route length of railway in operation was 17 miles, being the same as in the previous year. The accounts show the following figures for the past two years:—

	1914.	1913.
Ordinary shares (paid up)	£2,625,000	£2,625,000
Preference shares (5 per cent.)	1,000,000	· —
Loan capital	3,991,000	3,992,000
Gross profits	418,000	355,000
Interest on loans	149,000	97,000
Redemption and renewal funds	57,000	49,000
Net profits and balance forward	190,000	184,000
Reserve fund	7,200	7,300
Dividend on ordinary capital	118,000	127,000
Dividend on ordinary capital, p.c.	41	´ 6
Carried forward	31,000	31,000

The number of train miles run amounted to 3,937,000 in 1914, as compared with 3,666,000 miles in 1913; the passengers carried increased from 71,525,370 in 1913 to 77,027,513 last year; and the average receipt per passenger was 1.54d., being the same as in the preceding year. It is added that the preparatory works in connection with the connecting line between the "triangle" and the Nollendorf Platz have been begun, and arrangements been concluded with the town of Schonberg in regard to the construction and operation on joint account of a two-storey underground section at the Nollendorf Platz.

#### STOCKS AND SHARES.

TUESDAY EVENING.

Something like a halt has been called to the steady upward progress of prices in the Stock Exchange markets, though it cannot be said that there has been a decided tendency one way or the other. The news of the week-end was construed by some as disappointing, although many took an optimistic view, arguing that such incidents as a German advance towards Ypres are amongst the natural events of such a campaign. But the buying movement received a check, and in some of the markets prices showed a disposition to go back a little—which, after all, is by no means surprising, having regard to the rises of this month. The more reassuring communiqué of Tuesday did much to revive confidence.

Continued strength characterises the market for Home Railway stocks, more attention being paid to them than has been

Continued strength characterises the market for Home Railway stocks, more attention being paid to them than has been the case for the past four months. In view of the good yields still obtainable on the leading stocks, and still more by reason of the Government's slight concession in favour of the companies, the notice of investors has been drawn to this section. The Undergrounds have been little more than steady, this being due to the request for advanced wages on the part of Underground Electric Railways employés, which has been met by substantial concessions from the company. How far this is likely to be made up from one direction or another it is impossible to guess, so the stocks are hanging back in the general advance established by those of the steam lines.

London Electric Railway ordinary shares are firm at 28s.

3d. this price comparing with the end-July level of 30s. Districts, it may be noted, are 4 points below their quotation at

the time when war broke out; and Metropolitans are 7 points lower. The latter company's 3½ per cent. debenture stocks have been changing hands at about 83. District and London Electric Railways 4 per cent. rent charge was dealt in the other day at 89. District 6 per cent. debenture, by the way, now stands at 130, with dividends due in January and July, so that the return on the money at the present time is nearly 4½ per cent., and the security looks ample. Metropolitan Surplus Lands has been negotiated this week at 54½.

It is satisfactory to notice that the London and North-Western Railway Co. are still making steady progress with the electrification of the local line (high level) between Willesden and Broad Street, in spite of the double handicap of reduced staff through enlistment, and the extra demands made upon the system by the military authorities. Work on the last section, that between Dalston Junction and Broad Street, is now well in hand, although several isolated portions farther down the line have yet to be linked up. Beyond Hampstead, however, the work is so far advanced that the wooden guard to the outside rail is now in position. The scheme is, apparently, some way from completion as yet, but there is no doubt that it will prove a serious competitor with the tubes and trams linking up North-West London with the City.

Most of the Colonial and foreign electrical issues remain in public favour. Mexico Trams 5 per cent. bonds have gained 3 points at 58. There has been some nibbling at Mexican Light and Power 1st and 2nd bonds, at 50 and 30 respectively. With the re-entry of these issues to public notice, we have included some of them in our lists of prices. Two or three stocks of the British Columbia Electric Railway Co. are regaining a little popular attention. With regard to the deferred stock, it is known that the 8 per cent. dividend will not be continued; there is, in fact, some doubt as to whether the preferred ordinary will get the full 5 per cent. to which it is entitled. The price of the 5 per cent. cumulative preference stock has risen within the past few days from 75 to 80, and even now returns 61 per cent, on the money. The preferred, which stood at 50 about ten days ago, has gained 10 points since then.

Brazilian Tractions have receded to 58. There seem to be many sellers about at anything like 60, because the price has

Brazilian Tractions have receded to 58. There seem to be many sellers about at anything like 60, because the price has great difficulty in getting up to it. The 6 per cent. cumulative preference hardened to 95, and this is another security which gives 6½ per cent. on an investment at the current price. Canadian Generals are firm at 90 and 107 for the common and preference stock respectively, with little business doing in either. Montreal Light and Power Capital stock at 237 is actually higher than it stood at the outbreak of war. Mississippi Power preferred have firmed up to 45, and Vancouver power debenture to 79½. Pachuca bonds changed hands recently at 35, and Shawinigan Water Capital stock at 127½. Victoria Falls preference are also amongst those which command a better price now than they did last July, the current quotation being 15s.; while the 5½ per cent. second debentures at 88½ compare with 83, which was the price when hostilities started.

The Electrical Supply market is generally firm, with another

debentures at 88½ compare with 83, which was the price when hostilities started.

The Electrical Supply market is generally firm, with another rise of ½ in County of London preference. Metropolitans hardened to 3½, but City Lights at 1½ are ½ lower.

Nearly all the movements in the Telegraph market are in the upward direction, and the substantial rises recorded last week have been maintained in addition. Globe ordinary went back ½, but otherwise the changes have all been to the good of holders. The trouble still is to obtain stock. New York Telephone 4½ per cents. have now reached par. Business in the United States is reported as booming, more especially in such branches as those engaged, directly or indirectly, in the manufacture of munitions and war stores. Within the last day or two, however, some reaction has overtaken the bounding buoyancy of the share market; and the check administered to such bullishness has been slightly reflected in a few of the markets dealing with Home investments. Marconis went back to 1½, a fall of ½, apparently on sales by holders a little disappointed at the failure of the market to get about 1½, which seems to be the sticking point. Indo-Europeans have held the recovery of £4 which they enjoyed ten days ago.

Amongst Manufacturing companies, General Electric preference at 10½ are the fraction harder, but Edison & Swan shares of both classes remain dull, although the partly-paid at 30s. are a few pence better on the week. British Insulated preference have risen to 6½, and the ordinary to 11½. The rest of the list shows steadiness. The rubber market keeps good on the whole, in consequence of the output of company reports showing costs to have been reduced below 1s. per 1b. Most of the producing concerns have got their expenditure down to the neighbourhood of 11d., and some as low as 9d.,

reports showing costs to have been reduced below 1s. per lb. Most of the producing concerns have got their expenditure down to the neighbourhood of 11d., and some as low as 9d., per lb.; while hopes are entertained that even the last-named figure will be reduced in respect of the current year. People are buying the lesser-known shares which pay at least 10 per cent. on the money, and with a fair prospect of higher rates to come. In the Armament group, the Armstrong Co. has declared a dividend making 12½ per cent. for the year, the same rate as that paid by Vickers, but the shares of both undertakings are a little easier at 40s. and 36s. 6d. respectively, both prices including dividends of 1s. 6d. per share. The Projectile Co. is said to be contemplating repayment of all its debentures by June 1st next, and the 1s. shares, after going as high as 16s., retain a rise on the week at 15s. National Explosives are also better.

North of Scotland Electric Light and Power Co., Ltd.—The company made good progress during the first half of 1914, but the war has occasioned a serious falling off during the latter half. The lamp connections in Montrose have increased from 30,192 to 33,750, equivalent 8-c.p. lamps; in Brechin from 21,506 to 22,360, and in Inverness from 35,872 to 38,969, making a total of 95,079 connected in the three towns. Tae gross profit, including £1 859 brought forward, is £8,793, and after meeting interest, on dependance and loans amounting to £2,819 and interest on debentures and loans, amounting to £2,819, and writing off £57 from suspense account, there remains a net profit of £5,920. The directors recommend a dividend at the rate of 3 per cent. for the year, absorbing £1,500, that £2,000 be placed to renewal reserve account, and that £2,420 be carried forward. The annual meeting was held on April 21st.

Kidderminster and District Electric Lighting and Traction Co., Ltd.—The report for 1914 recommends a dividend of 2½ per cent., carrying forward £163.

#### RATIONAL RATING FOR FILAMENT LAMPS.

#### By S. M. POWELL.

It is now some five years since the writer had the privilege of writing in these columns in favour of candle-power rather than wattage rating for filament lamps, and as this problem is still not definitely settled but rather, for reasons given below, seems likely to become a more contentious matter than ever in the near future, the following remarks may be of interest as giving a brief review of both sides of the question and, in particular, as dealing with arguments which have been advanced in favour of watt-rating.

It may be, in fact it has been, contended that since wattrating is used by 80 per cent. of metal lamp manufacturers it must be right, or it would never have been adopted so extensively. The writer does not support this view. Owing to patent complications and the economic necessity for manufacturing on a large scale, the number of metal lamp manufacturers is relatively very small, and manufacturers have been in a position to do practically what they liked in the rating matter. It is convenient from the manufacturing standpoint to adhere to a fixed watt-rating, and hence that rating has been adopted, but it is neither desirable nor convenient from the user's standpoint. How is it, then, that the public has not complained and compelled the adoption of candle-power rating? Simply, in the writer's opinion, because of the fact that watts and candle-power have been numerically equal during recent years (at first in claim, based on the Hefner candle-power, and more recently in fact, based on the British candle-power). This coincidence is, however, purely accidental and temporary. As lamp effici-

encies improve further, the numerical value of candle-power will exceed that of watts, and the desirability of candle-

power rating will be much increased. It is more than probable that consumers will demand a candle power rating,

and though the position of lamp manufacturers is such

that they need not accede to that demand, it would be against the best interests of the electrical industry as a whole

not to fall in with consumers' wishes.

The ordinary householder is notoriously ignorant on all electrical matters, so that it is quite possible he will not be able to locate and express the cause of the confusion and dissatisfaction which he must feel if we persist in selling him lamps which are of constant wattage but steadily increasing candle-power. If we put ourselves in his place, we can only arrive at the conclusion that what he wants is a standard series of candle-powers, whether or not he has the perception to realize, and the ability to express, the fact.

The user of any lamp sets out to buy light. He is interested in what fuel or power expenditure is involved, because that determines what he has to pay for his light. The fact that so many lamps of such and such candle-power are charged for power on a wattage basis has nothing to do with the rating of the lamps, any more than a gas engine of so many horse-power is rated in cubic feet per hour, because the quarter's gas bill is based on cubic feet consumed.

Admittedly, the candle-power rating of lamps has been abused, special filament shapes and reflectors being used to obtain polar curves giving very high candle-power values in certain directions, but wattage is equally subject to abuse, as can be particularly easily seen by comparison of any arc lamp lists. As a matter of fact, wattage is only a guide to the illuminating power of a lamp when the type and distrition curve of the latter are known. From the user's point of view, to specify by watts is no more instructive, or less liable to abuse, than specification by candle-power. A candle-power figure does bear directly on what the user wants, viz., light, but if candle-power is not stated, watts and efficiency (i.e., watts per candle-power, which again brings us back to candle-power) are both required to tell the user what sort of a light-producing unit he is getting. Moreover, the user has to make a calculation to arrive at the candle-power value in the second case. It is a devious and quite illogical course to expect a user to get in the way of thinking of lamp sizes by watts. Perhaps a 40-watt lamp meets his needs now, but when a more efficient lamp

is produced a 30-watt unit will suffice—the man has to keep on changing his purchasing unit.

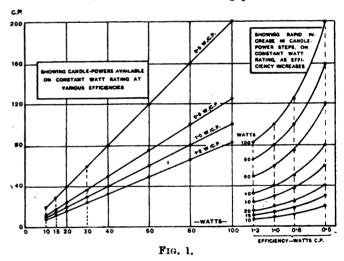

The argument that a user purchases light by the candlepower is countered by the advocates of watt-rating saying they are prepared to mark lamps with candle-power as well as watts. This is a very insidious offer, and is not a solution to the problem, since it does not permit the user to get year after year lamps of the particular candle-power which meets his needs. Suppose that standard watt-ratings be adopted, as in Table I. Using lamps of 1.2-watt efficiency,

TABLE I.—CANDLE-POWERS AVAILABLE ON WATT-RATING AT VABIOUS EFFICIENCIES.

1		Candle-power	ra available	1
Constant watt rating.	12 w. per c.p.	10 w. per c.p.	0 8 w. per c.p.	per C.P
10	81	10	12}	20
15	124	15	19	30
20	161	20	25	40
30	25	30	37.1	60
40	33½	40	50	80
60	50	60	75	120
80	67	80	100	160
100	83	100	125	200

a householder found that 30-watt lamps met his needs very well. Along came the 1-watt lamp, and the householder now gets 30 C.P. where he used to have 25 C.P. So far there is not much to grumble at (though if he had had the option he would doubtless have preferred to stick to 25 C.P. and get 15-20 per cent. off his lighting bill). Soon, however, the 0.8-watt/c.P. lamp will come along, and the householder has the option either of using  $37\frac{1}{2}$ -C.P. lamps or of returning to the original 25-C.P. size (now taking only 20 watts).

Neither alternative is satisfactory. Continuously increasing the candle-power of an installation is not only unnecessary, but is, after a time, objectionable and harmful, and reference to fig. 1 will show that the gaps in the candle-

powers available become rapidly greater as efficiency rises, the watt series remaining constant. The fact that the consumer has to make fresh compromises with every increase in lamp efficiency—using a lamp either more or less powerful than the one he wants (except for accidental coincidences)—leads inevitably to a certain amount of dissatisfaction, whereas, on a constant c.p. system of rating, there would be nothing but satisfaction caused by the higher efficiency, every consumer getting the same light as before at less cost.

If this state of affairs is to be mitigated by introducing fresh values in the watt series as efficiency improves, why not do what will alone give the consumer full satisfaction—alter all the watt values to keep the standard candle-power values and increments, adding, of course, any higher or lower candle-powers made possible by improved construction or higher efficiency?

Table II shows that maintaining a constant range of candle-powers would necessitate finer wattage grading, as efficiencies increased. It is no doubt a manufacturing con-

venience to build to a fixed scale of watts, but it is totally illogical to sell any energy-converting device of variable efficiency on the basis of its power input. Who would dream, for instance, of sizing turbines or steam engines by the lb. of steam used per hour? Yet that would be a manufacturing convenience, for the design of turbine and engine starts from the flow of steam known to be necessary to produce the horse-power which the purchaser requires. Of course the steam consumption matters to the engine user just as the energy bill matters to the lamp user, but, in both cases, it is the output, the work-doing ability

TABLE II.—WATT GRADING NECESSARY FOR FIXED CANDLE-POWERS AT VARIOUS EFFICIENCIES.

Constant cardle-power rating.	1'2 w, per c P.	Watts. 10 w. per c.P.	Consumed U8 w. per c.p.	0.5 w. pe c.P.
8	οĨ	8	61	4
16	19	16	13	8
32	341	33	251	16
64	77	64	δt	32
100	120	100	80	50
10	12	10	8	5

80	96	80	64	40
100	120	100	80	50

of the apparatus on which the latter must be sized. For another and closer analogy—does the manufacturer who had laid himself out to build quantities of Too, Te. 1. and 1-H.P motors change the rating of these to 0.012, 0.075, 0.15 and 0.3 H.P. when, by some means, he secures 20 per cent. increase in efficiency? Certainly not, he alters the proportions of the machines and beats rivals because his machines do a certain amount of work for 20 per cent. less energy consumption. Electric lighting is not a costly luxury. Everyone already uses just as much electric light as he needs, and what he wishes for the future is to get that light at lower and lower prices as time goes on, and not to have the amount of light manipulated and his energy bill the same till development happens to reach such a stage that he can use a lamp of lower wattage than before. It is only in dealing with such a commodity as light, which cannot be easily measured by the purchaser, that such a totally illogical practice would ever be tolerated for a moment. The thing to do is to keep on making half-pint and pint soup tablets, and not to expect the purchaser to drink stronger and stronger soup till suddenly he finds that what used to be a half-pint tablet will now make a pint of soup.

One of the chief advantages of electric lighting, viz, its constancy, is threatened by the constant-watts, variable-candle-power system of rating. It has been suggested that the greater constancy of watts, as compared with candle-power, is a cogent reason for rating by watts. Such an argument might apply to laboratory practice, but the user of electric light wants constant candle-power within, say, 10 per cent., and he gets it in modern lamps. The fact that the watts vary only 5 per cent. or so is of no interest to him; did they not vary at all that would not affect his primary interest in the candle-power.

The peculiar polar curve of many modern lamps and reflectors has been made an objection to rating by candle-power. The objection does not apply at all if lamps be rated, as they should be rated, in mean spherical candle-power. By so doing we preserve a logical basis of rating, and one on which the layman has quite reasonably accurate ideas. Mean spherical candle-power is a measure of total flux of light, and as such is a thoroughly suitable unit. It requires only a minimum of intelligence to see that the flux of light must be greater (i.e., lamps of higher candle-power must be used), if the light is to be distributed from an indirect fitting, than if the same working illumination is required over a limited area which can be served by a concentrating reflector. Any difficulty which exists is certainly aggravated if lamps be sized by watts.

A 20-watt lamp may be insufficient for a medium-sized room, but amply sufficient for a motor-car headlight illuminating several hundred feet of road. The wattage gives no idea of illuminating value in the two cases, but candle power rating does not require the type of lamp to be known. The mean spherical c.p. is the basis on which to rate the lamp for use in the room; for the headlight projector the total flux of light in the beam is again what matters, and is expressed proportionately by the mean spherical c.p. of the lamp. To meet the competition of acetylene and other headlamps it is particularly desirable that the direct c.p. of the beam should also be specified; it has a definite significance and use.

The specification and design of illumination schemes on a basis of watts per sq. foot of floor area is piling one absurdity on another. Already the use of half-watt lamps in indirect fittings has vitiated watt per sq. ft. tables compiled for ordinary tungsten lamps, and as time goes on, confusion will be worse confounded. Candle-power per sq. ft., on the other hand, is a true constant for each system of lighting and class of interior.

The difficulty is not to find arguments against wattrating, but to find any reasonable argument supporting it. Since wattage is related to useful effect only by the efficiency factor of the lamp, and since the latter varies with voltage, a 40-watt lamp, say, is of distinctly different candle-power and lighting value according to the supply voltage—could anything be more confusing, absurd, and liable to cause dissatisfaction? Admittedly it is easier to check watts than candle-power, but one is no further forward unless the efficiency also can be verified, and this again introduces candle-power. Any checking by the purchaser is unnecessary in the case of standard makes of lamps, and surely a deliberate misstatement of candle-power and efficiency by a second-rate maker is within the cognisance of the law.

The argument generally used to give the coup de grace to the unbeliever in watt-rating is that this rating is used by most manufacturers, and has been justified by practice. The writer wishes flatly to contradict this statement. The watt-rating has been imposed on the public by consideration for the maker's convenience, and it has, so far, been tolerated because wattage rating is practically a candle-power rating on 1-watt per c.p. tungsten lamps. Directly higher efficiency is reached in lamps for household use, the watt-rating must either break down, or cause endless confusion and no little dissatisfaction if it be persisted in.

Undoubtedly lamps should be made now and always in a convenient range of mean spherical candle-powers. Marking with mean spherical candle-power and wattage will tell the ordinary user all he wishes to know. In addition, polar curves of candle-power should be available to any person competent to tell therefrom how lamps should be placed. This point and the lamp candle-power required have to be decided only when the lighting installation is first erected. At that time the user has expert or at least intelligent assistance. Thereafter, the maintenance of efficient and satisfactory results requires simply the periodical replacement of lamps by others of equal candle-power. Without such constancy of candle-power, which cannot be maintained under a watt-rating system, permanent satisfaction is impossible.

Both watts and mean spherical candle-power should be marked on lamps, but candle-power should be the basis of sizing. By all means let the manufacturer work if he likes on a watt basis in his factory, so long as he changes this basis when necessary to preserve acceptable candle-power values and increments.

Australian Railway Scheme.—The plans for the Sydney railway, authorised by Parliament, have been modified by the Government with the object of reducing the expenditure. The modification consists in raising the levels at terminal stations at Redfern and Circular Quay, which will open-air stations, the four other stations being underground. The raising of the levels at the two points will reduce the cost of construction by £1,000,000. On account of the easier grades there will be a saving in power for working the railway, also with the present proposal 42 trains per hour can be run on each track, as against 36 in the original proposal.—Sydney Morning Herald.

## THE PREVENTION OF ELECTROLYSIS IN BOILERS.

A GREAT many cases of corrosion in boilers which have occurred both in marine and land practice, have caused extended investigation to be made from time to time as to causes of such corrosion, and the best means of security against deterioration due to such causes. Such investigations have been extended in many directions, and frequently the chemical and engineering treatment of the structural parts, and of the water used in the bolers, has proved of great benefit.

It has, however, become increasingly recognised that electrochemical action is responsible for very much of the deterioration which occurs in connection with such metallic structures as ships, boilers, condensers, pumps, and so on, with the result that for a long time past both private experimenters and public institutions have directed their attention to the problems underlying electrolytic corrosion.

In a recent report by the Corrosion Committee of the Institute of Metals, the abandonment of brass for condenser tubes was advocated. It was suggested at the same time that greater attention might be paid to electrolytic methods of combating corrosion. For many years auxiliary plates of iron, zinc or aluminium have been used with some effect in minimising corrosion by forming a galvanic couple with the metal to be protected, and this process is still largely used. When new, the action of such slabs is beneficial, because they are electro-positive to the metals they protect. Unfortunately, however, they are quickly transformed into zinc sulphates and iron hydrates, which substances are electronegative. Obviously, therefore, when this occurs these subs'ances join the attacking forces, and are doing more harm

For this reason it may be of use to refer to an electrolytic process for the prevention of scale and corrosion developed by the Cumberland Engineering Co., of London, which has yielded interesting results. Mr. Cumberland's success can be attributed to the fact that a stronger force than the one which it is desired to eliminate is brought to bear permanently by the introduction of electricity from an external source, this being distributed in the following manner:-Anodes suitably insulated are fitted in the vessel to be protected and immersed in the water contained therein. A lowpressure current is then supplied which is regulated by suitable resistances fixed on a switchboard. The current is generally used at a pressure of from 6 to 10 volts, and by means of an ammeter fixed on the switchboard the operator is able by the aid of the resistance to adjust the amount of current supplied to any vessel or parts of it. The iron anode is connected through an insulated bolt to the positive side of the circuit, and the vessel which it is desired to protect is connected to the negative side, making it the cathode.

When the current is supplied the elements of the water in the vessel become electrically charged, and by the laws of electrolysis the positive radicals or anions assemble at the anodes, and hence we find a film of hydrogen formed all over the immersed portion of the vessel, protecting it. The oxygen, acids and other destructive agents are attracted to the iron anode, which suffers from their attack, and, in course of time, becomes so reduced that it has to be renewed. By the use of this process the parts which used to suffer from deterioration through the corrosive effects of substances in the water are protected, the destructive action being transferred from the receptacle itself to the inserted anodes.

Moreover, in addition to preventing corrosion, this method removes all foreign matter from the immersed surfaces of the vessel. This is because the hydrogen is given off in minute bubbles on the surface of the metal, but underneath any scale, grease or other adherent matter. The e bubbles mechanically loosen such deposits, and when the surfaces of the vessel are once clean the hydrogen given off prevents the settling of any solids. This cleaning effect will be seen to be most important, when one remembers that 10th of an inch of hard scale may cause a drop in fuel efficiency of 10 per cent. in a furnace.

The cost of electricity and of anodes is extremely small when compared with the expense previously incurred for new

tubes and for laying off plant for repairs; therefore it is not surprising that owners and engineers of large undertakings are showing great interest in what is to many an entirely new system. It is also worth noticing that most of the leading shipping companies have installations on the boilers and condensers of their vessels, while numerous progressive firms in Great Britain have also adopted this system for land practice. For example, Messis. Maishall, Sons & Co., Ltd., of Gainsborough, applied the process to eight of their boilers and an economiser, with the result that the corrosion inside the boilers, which was previously very active, and because of which the apparatus had been specially installed, entirely ceased to spread, while there has been a considerable improvement in the amount of deposit in the economiser; a great deal of the old scale in the boilers was shelled off, and there was less new deposit than before the adoption of this process. Many similar results could be quoted. Demonstrations of the working of the system can be seen at the company's head office, together with some interesting phenomena associated with it.

## THE POWER SUPPLY OF THE CENTRAL MINING-RAND MINES GROUP.

By J. H. RIDER, M.I.E.E.

(Abstract of paper read before the Institution of Electrical ENGINEERS, April 15th, 1915.)

This paper deals with the power (electricity and compressed air) supply given by the Rand Mines Power Supply Co., Ltd., to those gold-mining companies of the Central Mining-Rand Mines group which have contracted with the power company for the whole of their power requirements, and treats the subject from the consumers' point of view. The paper entitled "Power Supply on the Rand." read by Mr. Hadley before the Institution on March 13th, 1913, dealt with the general power supply given on the Rand by the Victoria Falls and Transvaal Power Co., Ltd., and its associated company the Rand Mines Power Supply Co., Ltd., and treated the subject from the power company's point of view.

The companies of the group crush at present about 8,500,000 tons of ore per annum and produce about 36 per cent. of the total gold output of the Transvaal, or about 14.5 per cent. of the total gold output of the world.

The entire working and operation of the system of the Rand Mines Power Co. are under the technical control of the Victoria Falls Co.

Event of the mining groupening in the Central Mining Rand

Victoria Falls Co.

Each of the mining companies in the Central Mining-Rand Mines group has its own separate contract with the Rand Mines Power Co., under which it "agrees to take from the power company all the motive power needed by it, in the form of electricity and/or compressed air.

The whole of the compressed air supply (with the exceptions noted later) is given from the air mains of the Rand Mines Power Co., and only to the mines in the Central Mining-Rand Mines group. The Victoria Falls Co. has, so far, no air-Mines group. The compressing system.

An interim electrical supply, without any liability for damages for stoppages, etc., had been given to certain mines, up to about 8,000 K.V.A., from the stations of the Victoria Falls Co. The permanent supply under the terms of the contract began on March 1st, 1911.

The history of the first three years of the supply under the

The history of the first three years of the supply under the contract teaches one outstanding lesson, namely, that it is only courting failure to attempt to give a permanent and teliable supply without a proper reserve of generating and transforming plant. During 1911 and 1912 interruptions were frequent, both in the electrical and air supplies, and, as the fourth generator at Vereeniging was not put to work until October, 1913, a considerable amount of load (principally winders) was not changed over to electric drive until then, but was kept working on steam. It was not until August, 1914, that the power company was able to supply the whole of the compressed-air load, and up to that date a number of the old steam compressors on the mines were still used.

It is not for the author to explain the reasons for the frequent and sometimes lengthy breakdowns of the generating plant. He has little doubt, however, that some of them were caused by nothing else than continuous overloading, in an attempt to give as large a supply as possible from the existing plant, before the spare plant was ready. A reserve of 25 per cent, is not by any means too much, particularly with such large generating units as are used in the power company's stations, considering that the necessary periodical overhauls

^{*} Abstracted in the Elec. Rev. March 28th, 1913.

must put a certain amount out of action almost all the time.

must put a certain amount out of action almost all the time. Since the full amount (25 per cent.) of reserve plant has been available the supplies have been quite reliable, and any troubles have been generally local and of no long duration.

At the end of March, 1911, the power company was notified by the Rand Mines, Ltd., that its companies would require a total of 70,000 k.v.a. of electricity supply, and 21,000 lb. per minute of compressed-air supply at a gauge pressure of 100 lb., these demands being the aggregate of the demands of the individual mines as measured at the points of delivery.

Experience has shown that the maximum individual demands of the mines for electricity supply have a diversity factor of about 1.14, while the power factor averages about 0.77, so that the above aggregate demand represents a maximum demand upon the electrical system of about 47,300 km. The load factor of the electrical system is about 75 per cent., and the annual consumption at the rate of about 310,000,000 units. units

units.

Considerable economies have been made in the use of compressed air since 1913, and the maximum aggregate air demands now vary in the neighbourhood of 18,000 lb. per minute. The diversity factor is also very variable, but averages about 1.13, so that the maximum demand upon the compressed-air system is about 15,800 lb. per minute, or 37,900 kw. The load factor is about 34 per cent., and, as an air unit represents 27.441 lb. at 100 lb. gauge pressure, the annual consumption is about 103,000,000 air units. The energy value of the air unit represents 0.641 of the energy in one electrical unit, assuming isothermal conditions of air compression.

A flat price is paid for the electric and air unit, and is sub-

A flat price is paid for the electric and air unit, and is subject to special rebates, depending on the working costs of the power company and the cost of railway carriage of coal.

Owing to the great expense which would have been incurred in carrying air mains to the outlying mines, it was agreed that four mines should obtain their compressed air supply from their own electrically driven compressed and the from their own electrically-driven compressors erected on the

Mr. Hadley says in his paper that the electricity "supply is furnished to all mining consumers at 2,100 volts and 525 volts." Unfortunately the contract allows a variation of 10 per cent. up and down from the mean pressures, or a total range of 20 per cent. before any damages become due from the power company. That is, the higher pressure of supply can be anything between 2,310 volts and 1,830 volts, and the lower pressure anything between 577.5 volts and 472.5 volts. Such a range is much too great.

Damages are only payable for pressure variations beyond the above limits which last for more than ten consecutive minutes. If, however, the pressure variations cause a stoppage of any of the pumping, mining, and metallurgical operations, the damages due for failure to supply are payable.

The standard frequency of the electricity supply is 50 periods per second, but the contract allows a variation of 5 per cent. up and down from this, or a total range of 10 per cent., before any damages become due.

The whole of the transforming and extra-high-tension control Mr. Hadley says in his paper that the electricity "supply is

The whole of the transforming and extra-high-tension control

The whole of the transforming and extra-high-tension control apparatus at each point of supply on the mine properties is provided by the power company. The transformer and switch houses, however, are provided by the consumer. The transformer houses are brick or concrete structures, and including the switch-house section, cost about £450 per cubicle, to accommodate a 1,000 or 1,250 k.v.a. 3-phase transformer. There are altogether 23 transformer houses at the various points of supply, and the ratings of the transformers installed (1914) aggregate 125,750 k.v.a. About 6,000 k.v.a. additional rating is to be added in 1915.

Metering the Supplies.-The arrangements for measuring the various supplies have been the subject of very careful consideration by both parties. The number of units of electricity supplied to the consumer is ascertained by three integrating watt-hour meters placed in series and connected in circuit at each point of delivery on the low-tension side of the transformers. One complete set of meters is installed for each

pressure of supply.

The first meter of each set is the property of and kept in repair by the power company; the second is the property of and kept in repair by the consumer; and the third is the property and kept in repair at the joint expense of the consumer and the power company.

The consumer ways for the number of units represented by

The consumer pays for the number of units represented by the mean of the readings of the three meters at each pressure of supply, together with an allowance for the actual losses in

of supply, together with an allowance for the actual losses in the transformers installed by the power company at each point of supply, which does not exceed 2 per cent.

If the reading of each meter is within 3 per cent. of the mean of the reading of the three meters, each meter is considered correct for the purposes of the accounts. If, however, the reading of any meter at any time shows a difference from the mean of more than 3 per cent, the accuracy coefficient of each of the meters is, as soon as possible, re-determined by a test, and each meter having a coefficient which shows an error of more than 3 per cent, is re-adjusted. of more than 3 per cent. is re-adjusted.

The power company's electric meter and the joint electric meter at present installed are both of the A.E.G. make, while the consumer's electric meter is of the General Electric Co.'s

(U.S.A.) make.

The number of units of compressed air supplied to the consumer is ascertained by an air meter or meters provided by and maintained at the expense of the power company, and connected in the air-pipe line at the point of delivery. The consumer may also provide and maintain at its own expense

an air meter or meters at the points of delivery.

The number of units of compressed air paid for by the consumer is the mean of the readings of the meters. If the reading of any air meter at any time shows a difference from the mean of the readings of all the meters of more than 3 per

cent. such meter is, as soon as possible, tosted and re-adjusted. In addition to the tests referred to above, routine tests on all electric and air meters are made periodically by the technical staffs of both parties acting jointly.

nical staffs of both parties acting jointly.

The air meter used by the power company is of the Venturi type, while that used by the consumer is of the swinging-gate type. The former was described in Mr. Hadley's paper.

The gate type of air meter consists essentially of a weighted door or "gate," swinging from the top on horizontal pivots within a section of the main air pipe. The motion of the gate, the angular position of which is a measure of the flow of air, is transmitted through bevel gearing to a vertical spindle which is connected to the external counter mechanism. This is similar to that used for the Venturi meter, and is described in Mr. Hadley's paper. It contains automatic temperature and pressure correcting cams, and the indications of

described in Mr. Hadley's paper. It contains automatic temperature and pressure correcting cams, and the indications of the dials are given direct in air units.

The "gate" meter has a much wider range than the Venturi meter, and will read with accuracy down to 2 per cent. of the full flow. Both the Venturi and the gate meters were designed by Mr. J. L. Hodgson, of Messrs. Geo. Kent. Itd., and were first made for the Rand Mines Power Co., Ltd., and Rand Mines, Ltd.

Electric meters are tested in situ where necessary by means of portable secondary standard meters, which have previously been tested against the primary standard instruments of the power company in its laboratory.

Air meters are, where possible, tested in situ by means of

Air meters are, where possible, tested in situ by means of portable secondary standard instruments, which have been previously tested against the primary standard instruments erected at Ferreira Deep, Ltd.

The large displacement air meter, belonging to Rand Mines. Ltd., which is used in the air-testing station at Ferreira Deep. Ltd., is described in Mr. Hadley's paper. It is in constant use, and has proved itself to be a most reliable, accurate, and effective apparatus. effective apparatus.

All the electric meters at each point of supply are fixed in a All the electric meters at each point of supply are fixed in a special electric meter house adjoining the sub-station, and the connections to the various current and potential transformers are made through terminal panels, so that check meters and instruments can be readily inserted in the circuits.

The air meters at each point of supply, together with the main control valves and the temperature and pressure recorders, are fixed in the main air-pipe line within a special air-meter house.

The Use of Electrical Energy by the Mines—The number

The Use of Electrical Energy by the Mines.—The number of motors installed (1914) is about 1,500. They vary in size from 2 H.P. to 2,000 H.P. (R.M.S. rating), and the total horsepower is about 142,300, made up as follows:-

Winders			 	 57,340	H.P
Pumps		•••	 	 30,330	
Stamp mills			 	 13,890	
Compressors			 	 11,700	,,

Ventilating			 	 1,370	,,
Miscellaneou			 	 4,750	,,

Electric Winders.—The most important service is that of winding. There are at the present time 38 shafts in use on the mines of the group, many of which have underground winders for the lower depths, in addition to surface winders.

For the purpose of winding, shafts may be divided into three classes, viz. (a) incline shafts, which approximately follow the dip of the reef; (b) vertical shafts, which strike the reef at its lower depths; and (c) compound shafts, which descend vertically until the reef is struck and then follow on the incline. the incline.

A few of the compound shafts are still served by single-stage winders, the skip or cage first descending the vertical portion, then turning the corner, and finally descending the incline; but the majority now use a separate winder for the incline portion.

The deepest shaft of any mine in the group is No. 3 Shaft, The deepest shaft of any mine in the group is No. 3 Shaft, Village Deep, Ltd., which is 4,144 ft. deep in the vertical. An incline shaft has already been sunk at the bottom of the vertical for a distance of about 1,200 ft., and will be continued for an additional 5,000 ft., which will make the total length of vertical and incline over 10,000 ft. The incline shaft is at an angle of about 35° to the horizontal, and will probably be served by two winders on different levels, in addition to the surface winder which deals with the vertical only.

When the general electrification scheme was decided upon.

the surface winder which deals with the vertical only.

When the general electrification scheme was decided upon, it was resolved, for financial reasons, to use as many of the existing steam winders as possible, by removing the connecting rods and connecting up the motors to the drum shafts, either directly or through gearing.

At the end of 1914 there were 69 electric winders in use or on order, as enumerated in the accompanying table. The figures do not include small winches, etc.

Out of the total number of winding motors now in use 5f

of the 3-phase type and four of the Ward-Leonard type were ordered before the advent of the author on the Rand at the end of 1910. The policy which guided his predecessor in deciding to use 3-phase motors in such large numbers for winding was that of saving fresh capital outlay, as is indicated in a paper by Mr. H. J. S. Heather,* in which the theory of the control of such motors is investigated.

Mr. Heather thought the saving effected could not be under £50,000. Such a saving is certainly worth having, if there are no serious practical disadvantages from the operating policy, and, generally speaking, it must be admitted that

of view, and, generally speaking, it must be admitted that the three-phase winding motors on the Rand are working quite satisfactorily. Whether their use is justified, however, under all conditions, and whether Ward Leonard sets would not have proved more economical in working in many cases, are debatable points.

New. Converted Direct. coupled. Di ect-coupied. Geared. Ward Leonard ... 36 Three-phase 12 10 60

A 3-phase winding motor per sc is a much simpler machine than a continuous-current winding motor, with its necessary adjunct on a 3-phase system of supply, the motor-generator, but its control is not nearly so simple.

The control apparatus consists essentially of:

(a) Stator reversing switches, operated by the first motion in either direction of the driver's control lever.

in either direction of the driver's control lever.

(b) A variable rotor resistance, controlled by the further motion in either direction of the lever.

The rotor resistance usually comprises a tank in which are suspended metallic electrodes connected to the three slipnings. One side of the tank is closed by a moving weir or shutter, so that the level of the electrolyte, which is circulated by a small centrifugal pump, can be raised or lowered at will, which varies the resistance across the slip-rings accordingly. The rate of rising of the electrolyte, and therefore the acceleration of the winder, are independent of the driver, being the rate of rising of the electrolyte, and therefore the accelera-tion of the winder, are independent of the driver, being determined only by the rate of delivery of the pump, which is adjustable. This is much simpler than the complicated resist-ances, switches, and connections required by the Ward Leonard system. In practical operation, however, the Ward Leonard winder is much the easier to control, and for the

following reasons:—

(a) The manual energy required to operate the control lever is much less. In the Ward Leonard system there is only a cylindrical or face-plate resistance switch to rotate, which has no appreciable weight or inertia to overcome.

which has no appreciable weight or inertia to overcome.

In the ordinary 3-phase control there is the heavy weight of the weir to move up and down, and, although it may be balanced by external or internal weights, all the masses have to be put into motion and stopped by the driver every time. This is not only very tiring, but militates against accurate or fine adjustments of the position of the weir.

(b) In the Ward Leonard system the winding motor can be converted into a generator for braking, by bringing the control lever back just sufficient to lower the voltage of the generator (of the motor-generator set) below the back electromotive force of the motor.

of the motor.

In the 3-phase system the control lever has to be brought back beyond the neutral point, before braking (by reverse current) is obtained. That is (1) the weir and electrolyte have to be lowered, (2) the stator switches opened, (3) the stator switches closed again for the reverse direction, and (4) the weir and electrolyte raised.

(c) It is much easier to move the skip or cage of a Ward Leonard winder for a few inches (as is frequently necessary when coming to the landing place or tip) than to do the same with a 3-phase winder, for the reasons given in (a) and (b)

above.

The above features are obvious to anyone who has ever handled both types of winders, and appeal strongly to the

Attempts have been made to relieve the driver of the manual labour required to operate the control lever of a 3-phase winder, by using electricity or compressed air for opening and closing the stator switches, and compressed air for raising and lowering the weir. So far as the stator switches are concerned, both agents are quite successful, although electricity is to be preferred from the author's experience, and is in common use on the Rand. For raising and lowering the weir, however, compressed air proved a failure, because it was found impossible to predetermine the exact position to which the weir, would come, owing to the elasticity of the operating medium. Its trial showed conclusively that the driver must have direct mechanical control of the weir to work his winder properly. There are other points which only affect the relative economy of working. In the Ward Leonard winder electrical braking requires no electrical energy from the line, and will easily return energy by running the motor-generator slightly over synchronous speed. This is a material saving, as electrical braking with a 3-phase winder can practically only be obtained by using either reverse current or an auxiliary braking machine, such as an eddy-current brake, both of which make a direct call for energy from the line.

The eddy-current brake, of which several made by the British Westinghouse Co. are in use on 3-phase winders at Attempts have been made to relieve the driver of the manual

City Deep, Ltd., and Village Deep, Ltd., consists of a rotating field-magnet system, exactly similar to that of a low-speed alternator, fixed on the winder drum shaft, and revolving within a hollow cast-iron stator ring, with a smooth circular face opposite to the field pole-faces. Eddy currents are set up in the face of the ring when the magnet system is excited, which exert a very considerable and effective braking force without jerk or jar of any kind. Water is circulated through the hollow of the stator ring to carry off the heat which is generated. Fig. 1 shows the eddy-current brake on a winder at Village Deep, Ltd.

The energy for the magnet system is obtained from a motorgenerator. As originally fixed it was intended that one motorgenerator should serve the brakes on several winders, and, to this end, the regulating resistance was placed in the main circuit of the brake magnet-system. The final breaking of the field circuit at each operation proved very destructive to the

to this end, the regulating resistance was placed in the main circuit of the brake magnet-system. The final breaking of the field circuit at each operation proved very destructive to the switch contacts, besides setting up insulation strains, and the airangement has recently been altered by employing a separate motor-generator for each brake, with a rheostat in the field of the generator, so that the main circuit is never broken. This

the generator, so that the main circuit is never broken. This has proved very effective.

Each eddy-current brake was guaranteed to lower a net unbalanced load of 7,200 lb. at a rope speed not exceeding 1,750 ft. per minute, which is half the normal running rope speed for the winders in question. In practice it has been found that the brake will do much more than this, as, with an urbalanced load of 9,000 lb., the rope speed can be brought down to 250 ft. per minute, with an expenditure of energy in the field magnet-system at the rate of about 45 kw. The application of the mechanical brakes will then stop the winder in a few seconds. To obtain an equivalent result by applying reverse current to the winding motor required an expenditure of energy at the rate of about 1,600 kw.

The obstacle to the more general use of the eddy-current brake for 3-phase winders is capital cost, which amounts (with the motor-generator, etc.) to nearly two-thirds of the cost of the winding motor, and, in the cases above mentioned, makes the cost of the equipment practically the same as for the Ward Leonard system.

Ward Leonard system.

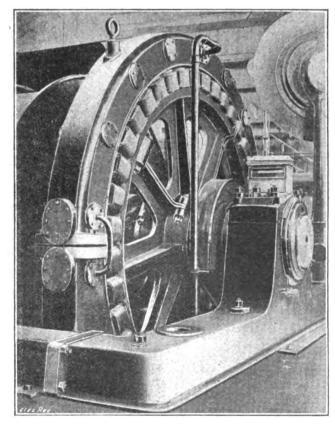

FIG. 1.—EDDY-CURBENT BRAKE AT VILLAGE DEEP, LTD.

While general motor troubles are dealt with later, the two principal ones peculiar to 3-phase winding motors may be mentioned here. The first relates to the stiffness of the stator frame. A frame which may be quite strong and stiff enough for a motor running always in one direction, and only started and stopped say once per day or week, frequently is quite insufficient for a winding motor, which is not only started in opposite directions usually about once per minute, but has to stand the severe mechanical strains due to electrical braking just as frequently.

Some makers do not pay nearly enough attention to this

Some makers do not pay nearly enough attention to this point, and have supplied 3-phase winding motors of which the frames distort visibly when current is switched on to the stator, so much so that the radial air-gap has disappeared at certain points. In many cases the rotor core has had to be ground down, and radial stiffening arms made for the stator.

^{*} Abstracted in the ELEC. REV. June 2nd, 1911.

Deep frames of box section, with heavy external or internal stiffening rings, are absolutely essential.

The second trouble relates to the rotor slip-rings and the control gear. If a 3-phase motor is running at full speed and reverse current at full pressure is applied to the stator, the induced open-circuit standstill rotor voltage is doubled. Many of the 3-phase winding motors on the Rand have an open-circuit standstill pressure of 750 volts, so that in such cases the application of reverse current at full speed, with the rotor on open circuit, would give a rotor pressure of 1,500 volts.

To avoid working with an open rotor circuit at any time, a sill is arranged at the bottom of the weir opening in the control tank, so that the tips of the electrodes are always immersed, but even with this a high rotor voltage is always obtained.

Manufacturers of 3-phase motors do not always provide sufficient insulation between the rotor slip-rings, between the slip-rings and the shaft, and between the brush holders, even for the full open-circuit standstill rotor voltage, if kept on for any length of time. The idea apparently is that, as the motors are run with the slip-rings short-circuited, the insulation is therefore of no great importance. Unless the insulation of those parts of such motors is kept scrupulously clean, trouble is often experienced in starting up.

With 3-phase winder motors this point is even more import-

often experienced in starting up.

With 3-phase winder motors this point is even more important, not only because such motors are started and reversed frequently for many hours together, but also because of the higher rotor voltage obtained when reverse current is applied. The rotor resistance tanks which were originally supplied

with the large majority of the 3-phase winders gave considerable trouble, because they were too small for the required duty and the electrodes were arranged much too closely together, a spacing of about 1 inch between phases being common.

During straight winding operations no great difficulties were experienced, but flash-overs between the electrodes were frequent when reverse current was applied, and even when these did not occur the electrolyte soon reached too high a temperature, as the retarding losses were then added to the accelerating and winding losses. As soon as a flash-over takes place the automatic circuit-breaker opens and cuts the winding motor off the supply circuit leaving collection and the problem of the supply circuit leaving collection. off the supply circuit, leaving only the mechanical brakes for stopping the winder.

The capacities of a number of the tanks were afterwards increased and the disposition of the electrodes altered. This has been quite effective in removing the risks of flashing over, but the resistance at full load is somewhat high, which not only wastes energy, but causes a comparatively high rotor "sip."

"slip."
Some experiments were then made to determine the safe minimum distance apart between phases, so as to avoid any chance of flashing over. At \(\frac{1}{2}\)-in. spacing the flash-over voltage was 850-900 volts; at  $2\frac{1}{2}$  in. it was 1,620 volts.

It would be impracticable to arrange all the electrodes with no less distance than 3 inches between them, as the sizes of the electrodes and tanks would have to be very great in order to give a sufficiently low resistance at full load and speed, when the electrodes are fully immersed. As, however, the rotor voltage decreases to practically zero as the rotor attains full speed, and from twice the normal to less than normal at the winder and its load are gradually brought to rest by reverse current, it follows that the proper arrangement is to use electhe winder and its load are gradually brought to rest by reverse current, it follows that the proper arrangement is to use electrodes of such varying shapes and lengths that the distances apart of those portions of the plates of the three phases actually within the electrolyte are gradually reduced as the electrolyte rises, and that the increase in the areas of the immersed portions of the plates is such that the current density is kept at a low value. A density not exceeding 1 ampere per square inch has been found to be a safe limit.

In other words, if the immersed portions of the electrodes are far enough apart and of such areas as will always keep the current density at a value not greater than the figure given, it will be found that they will be close together and of large area at full immersion when the rotor voltage is low and the current high; and at safe distance apart and of small area when the rotor voltage is high and the current low.

the rotor voltage is high and the current low.

Various designs of flat-plate electrodes were tried with this various designs of nat-plate electrodes were tried with this object in view, but they all proved more or less impracticable. The experiment was then made of using a large number of rods (actually angle iron) of varying lengths, arranged in the tank so that their disposition could be easily changed to obtain the required result. This was successful, as no flashing over was observed under working conditions, and the increases and decreases of areas and resistances were quite satisfactory.

## (To be continued.)

#### DISCUSSION, IN LONDON,

Mr. HADLEY said the paper described the largest installation, he thought, which purchased energy from a power company and gave some idea of the power contract. The power com-pany had had to expend some 3½ million pounds to give this supply to the mines, and as regarded variations in periodicity and voltage, the plant was undoubtedly started at first withand voltage, the plant was undoubtedly started at first with-out adequate reserve, but the position was now quite satisfac-tory. The power contract did not impose any particular obligation on the consumer as to use of the supply, as was often the case, and the power company also had considerable freedom. Big loads very often occurred suddenly, and he thought if the author had had his way, fewer direct driven winders would have been installed, and no doubt better results would have been secured.

Mr. Shepherd said he was struck with the enormous size of the undertaking, and asked whether 25 per cent. reserve plant was really sufficient with large turbine sets. It seemed plant was really sumcient with large turnine sets. It seemed to him that there was every advantage in putting in the Ward Leonard type of winder, but he was surprised that overwinding devices received so little mention, as the small headroom ought to make them useful. He asked whether the limiting head for centrifugal pumping had not been reached, and if it could be taken that practically no trouble had been averginged from insulation and dust in connection with the experienced from insulation and dust in connection with the

experienced from insulation and dust in connection with the electrical plant.

Mr. C. P. Sparks said he gathered that the very large winders were all of the Ward Leonard type, and if that was so it coincided with the practice here. In moderate sizes the three-phase winder could be used efficiently, but for large sizes some other system should be used; he thought they would probably adopt metallic controllers with three-phase winders in view of the author's experience. In this country very large high-head centrifugal pumping plants had been used for some years. Ventilation underground seemed to be an entirely different problem on the Rand, and judging from the small power used it was possible that the efficiency of labour could be much improved by increasing it. In England pressure variation was confined to 24 per cent. up or down, and this could very well be brought down to 1 per cent.

Mr. Hunter commented on the standardised size of H.T.

Mr. Hunter commented on the standardised size of H.T. oil switches; it appeared that mechanical methods in the mines were so settled that attempts at improvement were seldom successful. He asked whether the cam profile on the stamps had been altered in the author's experiments. The paper seemed to show that only the best apparatus should be

used for large powers.

used for large powers.

Mr. Roger Smith, referring to the question of measuring the purchased power, said the value of the accuracy given as 3 per cent. was some nine million kw.-hours, which was a large amount. When there were three meters in series, it was important that they should have different qualities of errors so that they cancelled out. He asked whether this was the case with the meter types used. Was there much difference between the results from meter calibration on site and in the laboratory, and what was the usual practice? The design of slip rings in induction motors was the weakest part and demanded the attention of manufacturers. His own experience was that it was worth while to use contactors for motors of smaller powers. He asked whether iron tube resistances, with water circulating in the tubes, had been tried.

Dr. Railing said he had discussed the technical features of the paper elsewhere, but as regarded the author's remarks on the relations between manufacturers and their sustances.

on the relations between manufacturers and their customers, he agreed that no doubt the former had sinned in the past and not supplied exactly what the purchaser wanted. He thought, however, that during the past five years the position had quite changed, and that the manufacturer was now prepared to meet requirements.

Mr. Robert Hammond said the great feature of the centralised supply was that the advantages of diversity were obtained; this was not realised a few years back. The paper showed that in the case mentioned there were 142,300 H.P. of motors installed, and the maximum demand was only 47,000 kw. He had been confronted some years back with the suggestion that the winding peaks might synchronise, but there were 69 winders in use with a total of 57,000 H.P. in this group of mines

group of mines.

Mr. Ll. B. Atkinson said the scheme of power supply in this case emanated from the consumer—the Rand mines group—but the originators did not succeed in convincing the mining people that the proposition was good enough for them to put their money into it. English engineers advised against the scheme in London, because it was thought that the proposals favoured the consumer too much, and consequently the money was found on the Continent. was found on the Continent. Another point was the possibly short life of the mines, which would have meant writing down the capital in, say, twenty years: but the mines would probably last longer than that. English people were prepared to finance the scheme, but English engineers said it was not

good enough.

Mr. E. J. Fox said this explanation was quite different to that usually given of the matters referred to, He always understood that German financial methods enabled them to find money better than ourselves; the only money found by them was in the form of debentures, and they reserved to themselves the right to supply plant. He thought the City of London did find all the capital, but others got the plums.

Mr. J. H. Rider, in his reply, said that with good generating plant 25 per cent. spare was sufficient; the troubles referred to in the paper took place at a time when there was not 25 per cent. As regards trouble due to pressure variation, momentary fluctuations were not referred to, but times when the pressure was very high or low for many hours; the motors of the took heavy converts for good deaths. the pressure was very high or low for many nours; the motors often took heavy currents for considerable periods and ranhot. Not until the Power Co. exceeded the limits mentioned could any redress be obtained. Now that the control system was improved the three-phase winder was perfectly safe; there was a little greater risk if the supply was cut off, but it could be counteracted if the mechanical brakes were in good order. No braking troubles had arisen with hoists which were constructed for electric working, but there had been

trouble with converted hoists. He had not much faith in overwinding devices; devices which took control out of the hands of the driver brought trouble. The risk of overwinding, he thought, was not serious, but there was a risk of starting hat thought, was not serious, but there was a risk of starting in the wrong direction, and such cases were the more frequent. The high heads mentioned for centrifugal pumps probably did not represent the limit of the pumps, but were very near the limit of the pipe line. No particular trouble had arisen with insulation, but the Rand climate was very dry. The largest winders, of 4,000 H.P., were of the Ward Leonard type, but many of the three-phase winders had single motors of 1,500 H.P. capacity. It must not be imagined that there was a shortage of mine ventilation on the Rand, as an immense amount of air was discharged into the workings from the drills. The stamp mill was exceedingly simple and robust—and "efficiency," in its case, meant something that would not stop. As regarded the metering arrangements, each meter had its own transformers, and speaking generally, there was no very great difference in the curves of the two types of meters. The metering was one of the most satisfactory features of the whole supply, and it was very seldom that any question arose with regard to it. The advantage of the contactor control was the easy work for the drivers. drivers.

## MEASUREMENT OF WIRELESS SIGNALS.

A GENERAL meeting of the Wireless Society of London was held at the Institution of Electrical Engineers on April 20th, when Prof. E. W. MARCHANT delivered a lecture on Methods of Measurement of the Strength of Wireless Signals. Dr. Marchant said that the Duddell-Taylor formula had been found consistent with subsequent investigations, and Zenneck's theoretical results had been verified by Austin's researches, but though these and similar formulæ were useful in giving an idea of the order of magnitude of received currents to be expected, it was the considerable fluctuations in signal strength which had to be investigated, and this could only be done experimentally. Variations of the order of 2:1 were commonly observed at different times of day and under different weather conditions in the received strength of signals which were sent out by constant power. In seeking to make quantitative measurements on the strength of signals, the first essential was constant conditions in the receiving aerial, which should be of standard, easily reproducible form, and as free as possible from surrounding obstacles. The resistance of the aerial circuit and the earth connection should be constant. He had found a water-pipe earth very constant in resistance at 20 ohms. The ordinary central-station type of earth connection, a copper plate in moist coke, gave good results, and there was under construction at Livergood and results.

resistance at 20 ohms. The ordinary central-station type of earth connection, a copper plate in moist coke, gave good results, and there was under construction at Liverpool an "earth" consisting of a copper strip and 6 sq. ft. plate laid in a sandstone trench. It was particularly interesting that this sandstone contained 10 per cent. moisture, though it had been covered by buildings and concrete for ten years past.

The most obvious method of measuring signal strength was by measuring the received aerial current or the voltage on the receiving circuit. About 1 microwatt was available on the Liverpool antenna (two 500-ft. horizontal wires 10 ft. apart, at a height of 150 ft.) from Paris, and these signals were very powerful. On the rectifying principle as little energy as 250 micro-microwatts could be made to give records. The Einthoven galvanometer would respond to 1 micro-microwatt, but it was a costly instrument, and some simpler and more but it was a costly instrument, and some simpler and more generally accessible apparatus was desirable. The Duddell thermo-ammeter required about 1 microwatt. The Wolf heterostatic system gave good results; thread electrostatic instruments had not yet attained much success; hot wire barretters were too easily burnt out by a rush of current. A variable condenser in series with the aerial was extremely convenient, and to reduce trouble from atmospherics, weak coupling should be employed and an inductive leak arranged between serial and corth, much a leak was your effective and did not interfere earth; such a leak was very effective and did not interfere with normal working. The greater selectivity obtainable by indirect measurement seemed quite to outweigh the lower efficiency; disturbance by atmospherics and other signals was eliminated. Fleming's arrangement of an "artificial aerial," so that an inductance could be connected either to the aerial or to an inductance and capacity corresponding to the wave to

or to an inductance out be connected either to the act at the received, was very convenient.

As regards the type of detector to be used, the perikon crystal type (zincite-chalcopyrites) in conjunction with a sensitive galvanometer had been found best at Liverpool. This detector gave better and more constant results than any using softer crystals; unfortunately it and others followed a square law, and so were insensitive for very weak signals. The Fleming valve, having nothing to go wrong, and being unaffected by bad atmospherics, appeared very tempting for measurement work, but results at Liverpool had been disappointing. An auxiliary voltage was generally required in the detector circuit to bring the valve to the sensitive part of its characteristic. On trying to eliminate this by using a U-carbon filament and plate electrode only 1 mm. apart, it was found that the sensitivity of the valve changed considerably, but not definitely (i.e., not so that the detector was

either "right" or "wrong"). Several recent developments of the audion valve gave promising results. Magnetic detectors were hardly sensitive enough for measurements on very weak signals, and one would not expect electrolytic detectors to be very reliable for measurements. The present tendency was to use continuous waves for long wave-lengths, generally in conjunction with the heterodyne telephone or other beats receiver. A constant local current of high frequency was the former of the process. receiver. A constant local current of high frequency was then required for measurement purposes. Heterodyne receivers were nothing like so efficient on spark as on continuous waves.

The Broca galvanometer used in the first quantitative work at Liverpool was satisfactory on good, sustained signals, and galvanometers were now available of sensitivity 240 mm. per micro-ampere, and period 0.1 second. The speaker's experience was that the best arrangement yet available was a high-frequency galvanometer in conjunction with a crystal detector. Members of the Society should take up the question of perfecting instruments and measuring signal strengths, since this, in conjunction with meteorological observations, would

this, in conjunction with meteorological observations, would do more than anything else to increase our knowledge of the conditions affecting wireless transmission.

Mr. P. R. Coursey said that, using Fleming's "artificial antenna" method, the chief difficulty was to measure the current in that circuit. Damping must be constant, and should be the same in the receiving and auxiliary circuit; Dr. Marchant's coupling method was preferable to direct connection. An alternating-current buzzer gave very steady oscillations, much better than obtainable working on its own contacts. It was possible to select Fleming valves which gave maximum sensitivity on zero auxiliary voltage. Rectification was much more perfect with a cylindrical than with a plate electrode. The tone wheel should be one of the best receivers for quantitative work with continuous waves. With it, an Einthoven galvanometer could be got swinging slowly so that half the amplitude of swing could be read at any moment; on moderately damped spark waves individual readings might be possible. When using a telephone in series with an Einthoven galvanometer, external noises often produced kicks and vitiated results. and vitiated results.

Mr. W. DUDDELL said that he still hoped to be able to build an electrostatic R.M.S. voltmeter suitable for measuring aerial voltages. Using a tiny gold-leaf electroscope, it was possible to read signals under the microscope.

#### ELECTRICAL SUPPLY TRADE IN BRAZIL.

PERNAMBUCO will soon be one of the best fields for the sale of electrical supplies, as well as many other lines, in South America. It is the main port and capital of the great sugar producing State of the same name, and the Pernambuco Tram-ways and Power Co. has only recently introducing the first electric railway and lighting system the city has had.

An American Government report recently submitted points

out that the city has under construction a modern power house out that the city has under construction a modern power house of ferro-concrete which is being equipped with the latest design of machinery from the British Westinghouse Co. Three 1,000-kw. 50-cycle 6,000-volt turbo-generators have been installed, and the foundation for a fourth is being prepared. The boilers and boiler-room equipment were furnished by Babcock and Wilcox. The engine-room and switchboard equipment are British Westinghouse, and the wire and cables are also English. The street railway is 1 metre gauge. The company has 110 cars—70 single-truck cars from the Brill Car Co., and 40 double-truck cars from England.

company has 110 cars—70 single-truck cars from the Brill Car Co., and 40 double-truck cars from England.

The city is the first port touched by the large lines from the United States and Europe. It is served by five submarine cables, three to Europe, one to the north, and one to the south of Brazil. Telegraph lines connect the city with the most important towns of the State, and a wireless station affords communication with the station at Fernando de Noronha (an island belonging to Pernambuco which has a long-range station and is of great service to the large liners). Three railroads connect the city with the principal coast towns and the extreme western part of the State. Construction work in the docks has been stopped on account of the war, as most of the officials were French and have returned to France. A complete sewerage system is almost completed. The central sewage station contains three electrically-driven pumps, each of the capacity of 300 litres per second. The central and substations are supplied with power from two 250-kw. generators bought in France. bought in France

In October, 1914, the Pernambuco Tramways and Power In October, 1914, the Pernambuco Tramways and Power Co. bought the telephone system from a Brazilian company. The system will have to be reconstructed from the switchboard to the subscriber. The present plant is on the earth-return system, with 800 telephones, mostly from Sweden, though a few are from England and France, a switchboard from Germany, iron poles from England, and wire from the United States. It will require a 1,200 drop board, 1,000 telephones, 2,000 iron poles, and 10 miles of cable and several tons of wire to reconstruct the system. The general manager of the Pernambuco Tramways and Power Co. will have charge of the rebuilding, and it would be advisable for companies intending to tender to communicate with him. It is to be hoped that firms tender-

ing will be careful to quote on just what the manager wishes rather than attempt to supply other goods, as has happened in the case of other cities.

The prospects for the sale of electrical machinery and sup-

The prospects for the sale of electrical machinery and supplies in Pará are not so good as they have been, but there is a steady demand for domestic specialities and a few motors. Most of the sales are being effected by the Pará Electric Railway and Lighting Co. (Ltd.), which is making a special effort to get as much apparatus installed as possible by selling at cost and allowing long credits. The company has had three public exhibitions, which have resulted in the sale of about £2,000 worth of household appliances, and the sales are running at about £300 per month.

Most of the household appliances sold and on hand are

Most of the household appliances sold and on hand are American made, and as they have been properly demonstrated the public appreciates their superiority, and buys them in preference to European goods which are selling at a lower price. As the lighting company is selling at cost it is not advisable for American manufacturers to sell to the local

dealers.

The Pará Electric Railway and Lighting Co. (Ltd.), incorporated in England, with a board of English directors, and operated by J. G. White & Co. (Ltd.), of London, who are the engineers and purchasing agents, took over the street railway and lighting system in 1906 and has built up a modern installation. The company has material on the ground for the extension of its lines as soon as the financial conditions will permit will permit.

The current for the lighting system is supplied at 2,200 volts

The current for the lighting system is supplied at 2,200 volts through H.T. underground cables to feeder boxes, thence to the aerial lines, from which it is stepped down by single-phase, 50-cycle, oil-cooled transformers to 240 volts for power and to 120 volts for lighting. There are about 50 factories operated by electricity, with motors varying in size from 1 to 100 H.P.

The present price for current for lighting is 2s. 1d. per kw.-hour, and for domestic appliances 3d. per kw.-hour. Power prices range from 3d. up, according to the quantity consumed. The company has on hand sufficient material to last one year, with the exception of a few minor supplies which will be handled through J. G. White & Co., Ltd., of London.

Maccio is a small town on the coast, 180 miles north of Bahia. The population is estimated at 15,000. The power and lighting system is owned by J. Basto & Co., under the name of Empreza Luz Electrica de Maccio. The power plant consists of three Belliss & Morcom high-speed enclosed type engines, directly connected to 120-kw. 3-phase, 50-cycle, 2,200-volt generators, and two German oil engines connected to 210-kw., 600-volt direct-current generators. The generators, and instruments are from the Electrical Constraints. volt generators, and two German oil engines connected to 240-kw., 600-volt direct-current generators. The generators, switchboard and instruments are from the Electrical Construction Co. The firm has been using English materials. It furnishes power, however, to the street railways, the manager of which is said to be favourably disposed towards American materials. The electric railway was started in June, 1914. There are 12 miles of single-track metre gauge, 10 single-track cars, 12 trailers, and 5 flat cars. All the equipment rails, poles and wires are from the United States, and are giving satisfaction. Street railway supplies will be considered by this company if presented by letter or catalogue, but the language used should be Portuguese or French.

The town of Bahia has a great future in the electrical trade.

The town of Bahia has a great future in the electrical trade The town of Bahia has a great future in the electrical trade. There are two railway systems, one owned by the city and the other by Guinle & Co., a Brazilian firm which owns the street railways in Petropolis and Nichtheroy. The city owns the lighting system, but would like to dispose of it if a fair offer could be obtained. Guinle & Co. also have under construction a hydro-electric installation 70 miles from the city calculated to furnish 30,000 H.P. in a dry season, but it will not be completed for at least two years.

There is a good opening here for firms that will enter this

will not be completed for at least two years.

There is a good opening here for firms that will enter this market with a full line of electrical and general machinery supplies, but there are one or two points that will have to be observed if much trade is secured. One is that reasonable eredit should be allowed, with paper as security on which the banks of the United States would loan money. This is the nethod followed by the German firms which have made a success in this trade. Another is that an American firm deing business here should have a representative on the ground, who can exhibit and push the goods. "I called on a hardware dealer here who handles a small line of electrical fixtures from Europe," says an American Consul, "and when I tried to impress upon him the superior quality of American goods he agreed with me, but said the fixtures he handled

I tried to impress upon him the superior quality of American goods he agreed with me, but said the fixtures he handled were cheaper, the designs were more popular, and the goods were lighter in weight, an important item when the duty is considered. These considerations will be effective as long as there is no American representative of a fixture manufacturer here, but a live man could convince the people of the advisability of buying the best."

It is also important for the American firm to get in as close teach with the actual buying public as possible. The manager of the Singer sewing machine branch here said that if they did not have an organisation of branch stores throughout the city they would not sell one-fifth of the machines they do, as the people want to trade direct with the company and do not care to buy from an agent. The expense of entering this market properly, however, is more than most average American houses can afford, and it would be of value if a number of manufacturers could combine to push the export trade.

trade.

The sale of electrical machinery and supplies is being neg-

lected in Bahia, because of the fact that Guinle & Co. are retiring from the market. This firm was organised by Mr. Guinle some years ago and has been of great service to the United States in placing American goods on the market. It was the agent of a large American company and had a head office in Rio and branches in Sao Paulo, Petropolis, Nictheroy, Bello Horizonte, Bahia, and several smaller places.

There are at present three firms carrying a small line of supplies, 85 per cent. of which are made in the United States. The only European house here has no stock at present. It is a branch of a Hamburg firm and was organised through the efforts of German manufacturers, who own the stock and control the company through the Hamburg office.

The firm handles the goods manufactured by the atockholders, and only German manufacturers are allowed to purchase stock. The local manager explained the system upon

The firm handles the goods manufactured by the stockholders, and only German manufacturers are allowed to purchase stock. The local manager explained the system upon which the firm is working, and by which it has been able to secure most of the contracts for materials used in the small installations in the interior and many of the smaller supplies in the cities. The head office is in Rio, with branch stores in Sao Paulo, Santos, Rio Grande do Sul, Porto Alegre, Bello, Horizonte, and Bahia, and in each place the firm is in a position to handle complete installations of hydro-electric machinery, street railways, lighting systems, cotton mills, sawmills, and many smaller lines.

With this organisation, good banking facilities, and Government co-operation, the firm has been able to furnish about 75 per cent. of the materials used by the companies not controlled by American interests. It allows credit according to the amount of the order, and the interest ranges from 6 to 8 per cent. If the manufacturer does not want to carry the customer he can go to the bank and discount the bill, but the manager says that in most cases the bank is glad to get the paper without a discount.

A local hardware house handles a small line of fans, wire, lamps, fixtures and specialities which are American, with the exception of the lamps and fixtures, which are German. The latter are made of cheaper materials and the fixtures are more ornamental and of much lighter make. The manager says the fixture trade is a new line here, and the people have not had time to see the necessity of buying the best.

The United States has furnished over 40 per cent, of the electrical machinery and supplies used in Brazil, not through any concentrated effort, but because the street railway and light-power systems in various cities are under the management of Americans.

light-power systems in various cities are under the management of Americans.

## THE LUBRICATION OF BALL BEARINGS.

By ARTHUR V. FARB.

THE more general use of ball bearings on electric motors has The more general use of ball bearings on electric motors has brought up a number of questions on the proper means of lubricating them: "Should I use oil or grease in my ball bearings?" "What kind of lubricant should I use?" One user of ball-bearing motors stated his question as follows: "I have been offered two grades of grease for use on the ball bearings of my machine. To me these two greases look the same, yet one costs almost twice as much as the other. How can I tell a good grease?" The purpose of this article is to answer these questions.

It should be recognised at the outset that although ball

answer these questions.

It should be recognised at the outset that although ball bearings must always be lubricated, the lubricant in a ball bearing performs a function different from the one it performs in plain bearings. In plain bearings the lubricant is used to keep a film between the shaft and the bearing lining, and this film must be maintained constantly in order to prevent wear and heating. The purpose of a lubricant in a ball bearing, however, is merely to preserve the highly polished surfaces of the balls and races. The balls and races are always in point contact, which necessarily means metal-to-metal contact. As a general principle, it might be stated that any lubricant that will not cause rust or destroy the polished surfaces of the balls and races, and that will properly circulate through the bearing and lubricant chamber, will be satisfactory. factory.

To preserve the highly polished surface of the steel balls and races, therefore, the lubricant must be chemically neutral; that is, it should be neither acid or alkaline. A good way to determine whether a lubricant is either acid or alkaline is to place some of it on a highly polished steel surface for a time and then compare this surface with that of a similar sample which is still in its polished condition. If the finish has been at all attacked, the lubricant is not desirable. Use can also be made of litmus paper, which will change its colour to pink if the lubricant is acid and to blue if the lubricant is alkaline.

alkaline.

It is also necessary that the lubricant should not undergo any chemical change owing to heat or other causes. In order to guard against such a change, it is, therefore, usual to employ a clean mineral oil or mineral fat of best quality.

^{*} From the Electrical World.

It is also essential that the lubricant should not contain any solid particles which would cause wear, and the lubricant chamber should be so sealed as to prevent the entrance of dirt, grit or other foreign substances into the bearing. It is quite a usual occurrence to find that a bearing wears down owing to solid particles of dust, etc., having found their way into the lubricant.

anto the lubricant.

From the above statements it is evident that, in all cases where one need consider only the actual lubrication of the bearing, a clean, thin mineral oil can be used with advantage. The greater the speed, the thinner the oil.

On the other hand, in those cases where there is a possibility of risk of exposure to dust, moisture or acids, the ball bearing should be protected by means of a solid grease. To ensure proper protection, the whole housing around the bearing should be filled with this grease, which should be of such composition and consistency that the internal friction of the lubricant and the increase in temperature which may result from its use will not cause it to become fluid. For this reason from its use will not cause it to become fluid. For this reason pure mineral greases, such as vaseline, will often be found unsuitable, as they usually have a melting point of 86 deg. Fahr., and when melted are of about the same viscosity as water.

water.

One should, therefore, in such cases select a solid grease of the very best quality—that is, it must have the lowest possible internal friction and, above all, be absolutely neutral so that there will be no risk of its attacking the polished surfaces of the bearing. Moreover, it should not contain resin or resin-forming matter. The presence of any large quantity of resin can be detected by the smell.

The solid grease suitable for ball bearings should contain about 90 per cent. of mineral fat.

When the temperature of the bearing can rise to 140 deg. Fahr. and higher, the bearing should be lubricated with a thick flowing machine or cylinder oil.

For vertical shafts where no special arrangement has been made for reliable lubrication with oil it is, of course, necessary to use grease, and what has been said with regard to the use of solid grease in general, of course, also applies to vertical mountings.

mountings.

Many machine manufacturers who use ball bearings make a practice of attaching a card with instructions printed thereon for the care of the ball bearings on the machines. These instructions do not go into detail at all, but they contain an excellent outline of the solution of the lubrication problem,

as follows:—
"To renew the lubricant in the bearing, remove the bearing cap, clean out all dry or caked grease, and wash out with gasoline or kerosene. Refill with a clean, fresh lubricant, being sure that the bearing and bearing housings are properly filled. Keep the lubricating and drain holes of the housing closed to prevent the leakage of lubricant or the entrance of directions.

dirt.
"Nothing but the purest mineral lubricant should be used.
as any acid, grit, rust, etc., quickly ruins the highly polished surfaces of the balls and races, thereby materially shortening the life of the bearing."

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

BAHAMAS.—The Government of the Bahamas has recently passed an Act providing for a surtax of 10 per cent. to be levied on the amount of duty payable on all goods imported into the Islands. The Act, which came into force on March 8th last, is to remain in force for one year, and from thence to the end of the next session of the Legislature.

SPAIN.—The Spanish Government has decided to prohibit the exportation to foreign countries of the following goods: Scrap-iron, steel and other metals, aluminium, tin and crude rubber (natural or artificial), and similar materials.

RUSSIA.—The Board of Trade have received information from Russia to the effect that a Decree was published on April 11th by which the rates of the Russian General Customs Tariff for European Trade are increased by one hundred per cent. in respect of all German, Austro-Hungarian and Turkish goods and on goods imported into Russia after passing in transit through Germany, Austria-Hungary or Turkey. Enemy goods which were free of duty under the Tariff are subjected to a special tariff, which is appended to the Decree. In virtue of the same Decree certificates of origin for foreign goods imported into Russia will be required from the date of the receipt of the text of the Decree by the various Russian Custom houses. A summary of the very detailed regulations contained in the Decree is being forwarded, and further information as to these will be given in due course.

CANADA.—Permission has now been given by the Postmaster-General of the United States for the use of Canadian Customs duty stamps on advertising matter for Canada, provided the stamps are affixed on the reverse side of the package. It will, therefore, now be possible to prepay the duty on RUSSIA.—The Board of Trade have received information

It will, therefore, now be possible to prepay the duty on

catalogues sent to Canada by means of these stamps, whether they proceed direct to Canada or via the United States.

SWEDEN.—A Royal Decree dated March 12th revokes the Royal Decree dated October 20th, and provides a new list of articles the exportation of which is prohibited. Amongst the articles now prohibited are the following: Wire of copper and of alloys of copper with zinc, tin, or other non-precious metal, twisted into cords or cables not insulated; wire of copper and of alloys of copper with zinc, tin, or other non-precious metal, also electric cables or lines (a) furnished with sheath of lead or other metal with or without armouring, (b) insulated with rubber, gutta-percha, asbestos, or varnish, or in any other way.

SWITZERLAND.—Amongst the articles whose exportation has recently been prohibited are the following: Magnetos for automobiles, copper ore, lead ore, antimony ore, and other crude ore. The prohibition takes effect as from April 7th.

#### INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

Kanchrapara Eastern Bengal State Railway.—A very up-to-date electric power house has recently been equipped at Kanchrapara, the chief loco and carriage workshops of this State railway. The scheme was designed and carried ounder the supervision of Mr. A. R. Gundry, the electrical engineer to the line. Formerly the workshops were steam-driven, now the drive is entirely electric. For day working the generators are steam-driven, and for night loads, mostly for lighting purposes, the generator drive is by Diesel crude of engine, manufactured by Messrs. Mirrlees, Bickerton & Day, Ltd. The entire electrical equipment was manufactured by the Lancashire Dynamo Co., and consists of generators, balancers, and motors for shop drive and various other purposes. A Rees Roturbo condenser and boiler feed-pump has also been provided. Some of the high-tension generating plant from the Sara Bridge power-house is to be removed to Kanchrapara to be used for long-distance transmission to Chitpore, for pumping purposes.

to be used for long-distance transmission to Chitpore, for pumping purposes.

Railway Electrification.—Before the war it was confidently hoped that Government would sanction a scheme for electrification of the State Railway suburban lines from Sealdah to Barrackpore and Naihati; but in all probability this scheme will be hung up until more prosperous days.

Punjab Electrical Inspector.—It is reported that Mr. C. C. T. Eastgate, a well-known Calcutta electrical engineer, has recently been appointed to this post, and will shortly arrive in India from England to take up his new appointment.

Electrolytic Manufacture of Sodium.—The apparatus used to manufacture sodium industrially resembles the Castner cell; it has a conical base in which iron and other impurities collect, and a cylindrical cathode and narrow ring anode are placed close together, so that only ½ to 5 volts are required per cell. According to a detailed paper on the subject by B. Neumann and S. Giertsen (abstracted in La Rerue Electrique), it is best to employ a large number of small cells, each holding 155 lb. of molten soda and consuming 1,200 amperes. The caustic soda is melted in cast-iron pots and poured into the electrolytic cells when starting work, and from time to time during operation. The distance between the electrodes is regulated to maintain a suitable temperature, which is not generally measured. The cathode is not cooled artificially, and the whole question of temperature regulation seems to be left to the discretion and crude devices of the operators. The bell cover dips 2 or 3 in. into the bath, and sodium is collected only at long intervale. The molten soda is rarely anhydrous, hence considerable foaming occurs and hydrogen collects and burns beneath the cover; explosions are of frequent occurrence. According to the impurity of the caustic soda, the bath becomes black and frothy, and needs renewing every two or three weeks; if the soda contains silica, hard crusts form in the cover. close together, so that only 41 to 5 volts are required per cell. weeks; if the soda contains silica, hard crusts form in the cover. From time to time the sodium formed is freed from soda, cast in iron moulds and stored in petrol or paraffin. The mean current efficiency in industrial working hardly reaches 40 per cent., and is more often only 30 per cent. On the basis of 40 per cent. current efficiency and is volts per cell, the energy consumption is 14'5 kW.-hours per lb. hours per kg., i.e., 6.6 kw.-hours per lb.

Russian Patents.—A Decree, to which assent was given on March 6th, supplements the existing laws and regulations with regard to patents, with a view to enforcing certain restrictions on enemy subjects. Under the provisions of this Decree, patents for industrial inventions or improvements will not be granted to subjects of countries at war with Russia, and procedure in connection with such applications already received is suspended. Patents of concern to the national defences and belonging to enemy subjects become the property of the State without compensation.

Ultra-Violet Rays from the Oscillating Spark.-The quartz enclosed mercury vapour arc, which first rendered practicable the application of ultra-violet rays to such services as the sterilisation of water, has now a rival in the oscillating spark which, according to Prof. J. Kawalski, of Fribourg, forms under which, according to Prof. J. Kawalaki, of Fribourg, forms under certain conditions a more economical source of ultra-violet raya. Working on an industrial scale with a step-up transformer feeding the oscillating circuit (which comprises a battery of condensers, self-induction and spark-gap paralleled across the condensers and discharging the oscillating circuit at intervals), it is claimed that water sterilisation requires no more than 45 to 90 watt-hours per 1,000 gallons treated. Laboratory tests show from 200 to 400-watt-hours per 1,000 gallons to be necessary for complete sterilisation, but water treated in practice is less infected than laboratory samples, and conditions generally are more favourable to ranid sation, but water treated in practice is less infected than laboratory samples, and conditions generally are more favourable to rapid sterilisation. The wave-length of maximum radiation from the oscillating spark is displaced towards the ultra-violet as the amplitude of the oscillating current is increased and as the spark is more strongly damped (i.e., as the energy expenditure in the spark increases). In order to increase the amplitude of the current, the capacity of the oscillating circuit must be as great and the inductance as small as possible. There is a risk, however, of increasing inductance as well, if it be sought to provide large capacity by using a great number of condensers. There is a cartain value of decreased in practice is a serial value of decreased in the same strong to the wave-length of current certain value of  $\sqrt{\sigma L}$  (corresponding to the wave-length of current produced in the oscillating circuit) which should not be exceeded for best radiation efficiency. The material of the electrodes is an important factor and should be such as to give maximum damping. Ultra-violet radiation between electrodes of invar, aluminium.

ing. Ultra-violet radiation between electrodes of invar, aluminium, brass, zinc and copper is found to be proportional to the numbers 128, 99, 85, 78 and 73. The frequency of sparking is also important, the ultra-violet intensity from a 22-mm, gap between invar electrodes being proportional to 2, 16, 13 and 10 with 20, 30, 40 and 50 sparks per second respectively.

The percentage distribution of radiation horizontally in the direction of the axis of a 110-volt Heraeus lamp, operating at 90 volts, 31 amperes, is given thus:—Heat, 24 per cent.; visible, 41 per cent.; ultra-violet, 35 per cent.; 275-233, 113 per cent.; 233-223, 11 per cent. The radiation from a 22-mm. invar gap, operated at 30 sparks per second, with 50 amperes in the oscillating circuit, is analysed, by the same method, as follows:—Heat, 22 per cent.; visible, 18 6 per cent.; ultra-violet, 59 4 per cent. These figures show the oscillating spark to be 70 per cent. richer than the mercury are in ultra-violet radiations. The spark gains a considerable initial advantage in that it can be produced directly in the water to be treated, without the necessity for the quartsthe water to be treated, without the necessity for the quartz-envelope which absorbs up to 20 per cent. of the ultra-violet radiations from a high-pressure mercury are, and those, moreover, which have the greatest sterilising value. To meet industrial re-quirements for a simple instrument determining the ultra-violet radiations of any source, Prof. Kowalski utilises the property possessed by ultra-violet rays of decomposing lavulose (and certain other carbohydrates) to liberate carbonic oxide. The beam to be tested is simply passed through the windows of a small closed vessel containing levulose and connected to a mercury-filled capillary tube which indicates the amount of gas liberated, and so, subject to a temperature correction, the intensity of the ultra-

violet radiations.—La Revue Electrique.

Russian Views on Municipalisation.—At a recent meeting (March 18th) of the Imperial Russian Technical Society, held to consider the proposed purchase of the electrical concerns of meeting (March 18th) of the Imperial Russian Technical Society, held to consider the proposed purchase of the electrical concerns of Petrograd by the town, to which reference was made at a previous meeting, the majority of those who took part in the discussion spoke emphatically in favour of the municipalisation of the Electrical Trust. Some, however, felt compelled to point out that such concerns as tramways and telephones, run by towns, often proved to be unsatisfactory; some involved loss, as in the case of gas supply; and, generally, they did not efficiently attain their object of serving the interests of the consumers: whereas gasworksin private hands yielded good profits. One of the speakers specifically instanced towns where the electricity was already municipalised—Karkoff and Samara—where the position was very unsatisfactory. Experts, representatives of electrical companies, contested the assertions of the lecturer, K. Ya. Zagorsky, that with the adoption of turbo-generators of great power, production would be cheaper. The experience of one company had, they said, demonstrated the inaccuracy of that opinion. Another speaker, analysing the figures on which Prof. Wolf concluded that the price of energy could be much reduced, said it was impossible. The town would gain nothing, and the concern would yield too little profit. It were better to try to reduce the rates of existing companies. The discussion became heated, and lasted till midnight, when the meeting stood adjourned. when the meeting stood adjourned.

#### THE WAR AND FUTURE TRADE.

In the early days of the war, when the production of war requirements for ourselves and our Allies was not engrossing the attention of between two and three thousand British factories, and when the closing of the Home and overseas markets to German manufactures possessed more of novelty than it does now, there was a considerable liveliness in agitations for the formulation of a future trade policy which should appropriately express our national determination to be more independent of Germany. In the interests of manufacturers who were perplexed as to whether it would prove worth while to commit themselves to capital expenditure for the production of new lines, we ourselves expressed the hope that the Government would see fit to appoint a Commission to report on certain aspects of the new situation. Though we do not find it necessary to withposition that we then assumed, we have to recognise that as the months have passed by, the trade war agitation in these islands at least has become much subdued. The lull is in all probability only temporary and at a later date the movement will doubtless gather even greater force than characterised it a few months ago. That there should be this comparative pause is most natural and reasonable when we consider the unparalleled extent of the struggle in which we are engaged, and the strange and tragic experiences through which we are passing.

The determination to crush Prussian militarism is as strong as ever in the mind and heart of Britain, and we with France and Russia, Belgium and Serbia, are paying the huge and inevitable price, and while we are so strenuously engaged with this and all the thousand things that it means, touching our lives on every side, we can hardly expect to gain an attentive and sympathetic ear either from legislators or from the common people for matters appertaining to future trade, however vital they may seem to us.

There are very many things that we should like to see the Government do to assist the British manufacturer to put up a more successful fight against the German industrial and trading systems, and probably one or two more special war-time Committees will be added to the 30 or 40 that have already been appointed, which will have such matters expressly relegated to them. But it seems that it must of necessity be a long time before this present or any other Government will be able to formulate an after-the-war trade policy for the United Kingdom, for it must in a large measure be affected by the course things take both in the remaining period of hostilities and in the complicated and lengthy negotiations which will settle the terms of permanent peace.

It becomes more and more obvious as we study the problems of peace, even as superficially as is possible at this date, that that stage of this world conflagration will be only slightly less difficult than are our vast and unprecedented Naval and Military operations. And who can say what will be the nature of questions then arising which shall affect our future trading relations with the millions of people who will remain in what we now know as the German

[641]

and Austrian Empires? Notwithstanding all the obscurity in which such matters are necessarily involved at present, there is undoubtedly deep down in the British breast a fixed determination that German manufactures shall never have the place here in the future that they have occupied in the Already measures have been taken, under the compulsion exerted by the closing of the market to enemy goods. and because of the more favourable opportunities that the same circumstance has afforded us, which will go some way toward enabling British works to carry that determination into effect when trading relations, on whatever basis may be ordained, are resumed between the industrial nations of Every month that the war is prolonged and the British Navy prevents enemy countries exporting manufactured goods, the position of Teutonic export trade becomes weaker, and the task of its ultimate recovery is made more difficult. Meanwhile, we shall go on exporting as energetically as the Government war demands will permit, and the information and organisation of the Board of Trade will continue to be placed at our disposal. May we hope that in readiness for whatever may be the new state of things when hostilities cease, the Board of Trade's recent activities will be carried a step or two further? We trust that Mr. Runciman will recognise the need that exists for a measure of modernisation and organisation with certain supplementary alterations making for greater efficiency and usefulness, supposing that he cannot see his way to adopt the proposals that are being again advanced in some of the more ambitious schemes that have been put before him by critics and advisers.

Whatever may be our views in regard to the adoption of a new trade policy for the United Kingdom, it is clear that our blood relations in the Colonies are freer than we are from some of the hampering influences. It has been already stated that the Colonies will be taken fully into consultation whenever the happy but difficult days of peace deliberations arrive. It will be but reasonable, too, that they be allowed to have a voice in the formulation of a future British world trade policy. They have given to the Mother Country, to the Empire, to the general cause of Civilization, of their best in both blood and treasure, and they have a pretty clear idea of the need for a strong policy for the future so that no repetition of these terrible experiences shall be possible. And from what we have read of Colonial newspaper and other comment, in regard to no other aspect of the situation are they so determined as in relation to the prevention of future Teutonic com-mercial supremacy in their lands. We receive letters from Australia with envelopes bearing the legend: "Don't let German goods in after the War!" "Why should Germans have a Vote in this country?" This attitude is also reflected in letters in the Australian Press where public men write: "Unless we frame an after-the-war policy, which does not include the German and his friends, we are going to have some pretty strenuous times in Australia during the next few years." "Immediately the war is over, Germany will endeavour, at all costs, to recapture her lost foreign trade, and we may reasonably expect she will flood the world with low-priced German goods. What sacrifices will she not make in order to undersell her opponents, and once again gain access to foreign markets?" Thinking in this strain, it is small wonder that some authorities there who have British interests at heart hold that this menace constitutes a grave danger to Australia, and are asking for the strongest possible policy to be adopted. Of course, the Colonies are freer from restriction than we are in dealing with import trade, and in whatever measures they see fit to introduce they will be but consistently following along the preferential lines that they have hitherto adopted. Here, of course, the position is not so easily handled, where departure from principle or long approved policy is involved. But we shall be wise if in the Home Country we keep ourselves fully informed as to the attitude of the Colonial mind, and the thoroughness which they desire to adopt in excluding the enemy from trading operations in their lands in future. Only this week we have received from an esteemed correspondent in Victoria a piece of news which shows which way the wind is Failing ability to completely exc'ude German or Austrian goods, they will make it as difficult as possible for them to compete with British-made manufactures. To

that end the Berwick Shire Council on March 22nd unanimously carried the following resolution:—

That the Council circularise all municipalities, inviting their co-operation in urging the Government to place a duty of 50 per cent. on all German goods imported, and all goods of German manufacture that might be made in other countries after the war.

We quote this as an illustration of the Australian trade agitation that is spreading; all the municipalities in Victoria, at least, are being approached. The importance of the matter to our readers lies in the fact that Germany has in the past had so strong a position in the Australian electrical field, and Australians, in adopting this British trade policy, are anxious to have the fullest possible co-operation and support from our manufacturers in the United Kingdom.

THERE has been an irregular and weaker tendency observable lately in The restraint which has been put upon export trade has had a notable influence in reducing the premium upon early deliveries, and has thus brought about much healthier fundamental conditions, while the reduction in price will eventually stimulate buying. Prompt lead at one time sold down to about £20 10s., but the fall to this level was brief, for at the reduced prices the metal looked cheap, and buyers came forward in large numbers to take advantage of their opportunities, a large business being done, particularly by France, while speculators have displayed increased activity. At the same time export business is much restricted, and the recent closing of navigation with Holland put a further obstacle in the way of shippers of lead. Now that communication with Holland has been reopened, it is probable that fair quantities of lead may be shipped there from here, while export demands are likely to undergo considerable expansion from other quarters. From time to time considerable business has been done for shipment to Russia, but there are still difficulties in the way of obtaining shipping permits, and there is a decided abundance of lead available for early delivery.

While the United States has not been exactly pressing lead, there are indications that considerable quantities are available across the Atlantic, and at any improved level of prices it is thought that sellers in America will again display more interest in the European position. As regards the home trade, activities have been rather in a state of suspense, but there seems to be some small indication of an improvement in demand, though general trade can hardly assume anything like normal proportions in these days of almost universal warfare.

There can hardly be much reduction from the current level of prices, though temporary fluctuations are to be expected. The general trend of sentiment seems now to be slightly in favour of higher prices. It must be borne in mind that the authorities are determined as far as possible to prevent any undue appreciation in the price of early over distant deliveries. There is no doubt that they would have no hesitation whatever in enforcing an entire cessation of shipments from this country, if circumstances appeared to justify the taking up of such a position. The world's requirements are exceedingly heavy and practically confined, of course, to the production of war munitions, hence the integrity of the British market so far as national requirements here are concerned becomes a matter of vital importance. Under no circumstances will any outside consideration be permitted to interfere with this necessity.

The position in the United States has varied but little, the conditions being regarded as intrinsically sound, and very little interest has been taken in the movements notified from the London market. The home trade demand across the Atlantic is rather poor, but this is bound to improve owing to the large ammunition orders which are being executed for the allied Powers, and independent producers are so well sold up that they are not offering metal for anything earlier than June shipment. It is commented upon as very curious that the war should so far have had but a trifling effect upon lead prices, while it has quadrupled the price of antimony, trebled the price of spelter, and added about 50 per cent. to the price of copper.

Digitized by Google

WE have often remarked upon the The Kenotron. importance of scientific research, and the illimitable field which still remains open to investigators, and recent developments have emphasised these points. Unfortunately, they seem to be more fully realised abroad than at home.

In the early days, when electrical discoveries could be made with simple apparatus and scanty resources, this country led the world in scientific progress. At a later date, while our manufacturers were busily cultivating the industrial-and, alas! the financial-fields thus thrown open to them, the Germans, with their keen appreciation of the value of science to industry, forged ahead, but were always handicapped by their deficiencies on the practical side. The United States, while fertile in ideas, and quick to grasp the commercial possibilities of a new invention, erred like ourselves in undervaluing scientific research, but not many years ago the General Electric Co. awoke to a realisation of the facts, and established at immense cost a special

boratory for research, which was equipped with apparatus ad libitum, and a staff of investigators of the highest ability. Thanks to the admirable combination of commercial acumen with scientific insight, the result has been the evolution of a series of inventions of the highest importance to mankind. of which the laboratory may be justly proud. Foremost amongst these are drawn tungsten wire, the nitrogen-filled lamp, and the Coolidge X-ray tube; but the laboratory is not content with working on narrow lines towards set objects such as these; its scope is far wider—and the fruits of its labours have been, and no doubt will be, correspondingly rich and abundant.

The staff of researchers sets to work to find out all that can be discovered in a particular field, and accomplishes its task with skill and thoroughness that compel our admiration; and when the facts have been discovered and principles deduced from them, the way is clear to turn them to some Nor do the investigators neglect to avail practical use. themselves of the fruits of the work of others in kindred fields; and thus it is that the "Kenotron" has been brought into existence.

Starting with the "Edison effect" as basis, from which Dr. Fleming had developed the "valve" so useful in wireless telegraphy, the investigators brought to bear upon this embryo rectifier the powerful resources of the Research Laboratory. They had at command unrivalled facilities for the production of vacua of a degree hitherto unattainablebe it noted that they employed the Gaede pump, which drags out the individual molecules of air-and by this means they found out the cause of the erratic behaviour of the valve previously observed, and reduced the phenomena to order and discipline, so that they could be reproduced at will. In this work they had the benefit of the scientific work of an Englishman, O. W. Richardson, who had covered a good deal of the ground. In the end they produced an instrument subject to perfectly definite laws, and having an extremely high efficiency; it is true that at present it has been constructed only for small currents, but it deals with enormous voltages - 100,000 to 200,000 volts - and already a single kenotron can rectify 10 kw. The device is as yet in its infancy, but, as Dr. Dushman points out, it offers great possibilities.

The most striking feature of this new instrument is the fact that it depends for its operation upon the discharge of a stream of electrons from a heated body in an almost perfect vacuum, under the influence of an applied potential d fference - a discharge which is unidirectional. It utilises the fundamental principles of electric flow, as now understood, and at the same time affords a singularly convincing demonstration of the truth of the theory itself. The current is conveyed through empty space by particles of negative electricity, each 1800th of the mass of an atom of hydrogen. Surely the thought of that swarm of infinitesimal particles hurrying to do our bidding should inspire us with hope for the future unravelling of the mystery of the ether, and the unlo king of the secrets of the energy contained in the molecules of matter.

THE NATIONAL ELECTRICAL CODE REVISED.

BY FRANK BROADBENT, M.I.E.E.

THE National Electrical Code, which is the American equivalent to our Institution and other Rules relating to electrical installations, has just undergone its biennial As was pointed out recently in these columns ( the Code is rendered unnecessarily bulky by the inclusion of detailed specifications relating to the manufacture and testing of cables and apparatus, regulations which do not very greatly concern the wireman or contractor working under the National Code, inasmuch as his responsibility ends by specifying in his orders to the manufacturer that the material must have received the official approval of the National Board of Fire Underwriters.

It is, therefore, interesting to note that it is now proposed to omit these detailed specifications from the Code, and to include only skeleton outlines of the requirements. The manufacturing specifications referred to will be published separately and will, therefore, be available for those whom

they particularly concern.

The method of revision of the National Code differs somewhat from that adopted by our own Institution, where the regular practice is to appoint a Revision Committee, which has power to consult interested parties or experts in the various branches of installation work, and, having come to a decision, the Committee has power to make such revisions as it may consider necessary or desirable.

In America the opposite course is adopted; the Committee first of all revises the rules, and then a public meeting is called to vote upon the details of the proposed revision. such a practice were adopted here, it is doubtful if half-adozen persons besides the members of the Revision Committee would think it worth while to attend at the Institution premises on the Embankment in order to record their views and votes. In marked contrast to this apparent apathy, the American meetings are well attended and the subjects vigorously discussed. At the meeting held on March 24th, in the premises of the New York Board of Fire Underwriters, to consider the suggested modifications in the Code and to go over the reports of the various subcommittees, the auditorium was filled to its utmost capacity, a portion of the andience being able to secure only standing room.

One of the points which gave rise to considerable discussion was the use of refillable fuses, by which is meant what we should call cartridge fuses. It was supposed that the use of refillable fuses would largely, if not entirely, prevent the abuse to which the ordinary open type of fuse is subjected. The Electrical Committee had recommended a further trial of refillable fuses and the accumulation of more This was strongly opposed by several speakers, experience. who contended that refillable fuses were unsafe, that they were just as liable to abuse as the old types, and that further experiment was quite unnecessary.

The Committee's recommendation was finally defeated, and the following resolution adopted :-

It is the opinion of the Committee that experience has not yet shown that fuses in which the fuse element is intended to be replaced or renewed by the user are satisfactory in test or in field service to a degree warranting the recognition of the principle of refillable fuses in the rules of the National Electrical Code.

This resolution, it would appear, bears hardly on those manufacturers who, during the period of prob. tion, had standardised replaceable fuses in the hope and expectation that this type of fuse had come to stay, and it is not surprising, therefore, to learn that representatives of some of the manufacturers present questioned the authority of the meeting to quash the Electricity Committee's recommendations. The protest, however, was without effect, as it was held by the Chairman that the final court of appeal was "a meeting of the public interested in the subject." In view of the headway which the replaceable type of fuse has made in this country, the above decision is particularly interesting to English electricians.

In our rules we have as yet nothing specifically referring to the installation of "gas-filled lamps," but the

^{*} Reference is to the author's recent article on The National Code and British Wiring Rules.

National Code recognises their use, and, among other rules, the following now appears:—

Must not be used in shop windows or in other locations where inflammable material is liable to some into contact with lamp equipment, except where used in connection with approved fixtures where temperature of any exposed portion of same does not exceed 200° F.

This rule will, no doubt, cover mercury-vapour lamps, Moore tubes, half-watt lamps, and others in which the

vacuum principle is not used.

Another point in which the National Code differs from our own rules is that the carrying capacity of wires used in connection with motors must be higher than for lamp circuits. Formerly the National Code specified that all conductors on motor circuits must be designed to carry a current at least 25 per cent. greater than the rated motor current. This rule is now altered to read as follows:—

Wires carrying the current of only one motor must be designed to carry a current at least 25 per cent. greater than that for which the motor is rated.

From this it would now appear that the wires to individual motors must have a 25 per cent. margin, whereas the main circuit conductors feeding a distributing-box from which several motors are fed need not be so highly rated.

which several motors are fed need not be so highly rated.
On the subject of "service wires" the rules neither of the Institution nor the Home Office are concerned, this subject coming within the jurisdiction of the Board of Trade, assuming the supply to be given from outside under B. of T. regulations. On a self-contained installation, however, in which there are siveral blocks of buildings connected to the generating plant through outside wires, the latter would be regarded as service wires, and these would then come within the scope of our Institution rules, and, in the case of a factory, under the Home Office rules also. On this subject a new paragraph has now been added to the National Code to the effect that metal conduits containing service wires must be insulated from the metal conduit or armouring of cables, or any other metal on or near the Alternatively they must be permanently and building. effectively earthed to water or gas piping, or other suitable earths. If earthed to gas piping, the connection must be on the street side of the gas meter. The earth connection must, however, be in addition to any other earth connection on the metal conduit or armouring within the building. The reason for this rule is not quite obvious, as if all the earth connections are properly made there would appear to be no reason why they should not be bonded together, and it is common practice here to bond the interior conduit system to the supply sheathing, and to rely upon that for "earthing."

Another new paragraph which is not quite in accord with the general opinion obtaining in this country is that the main supply switch should be protected by the main cutout, "unless the switch is of the knife-blade type and enclosed in an approved box or cabinet, under which conditions the switch may be placed between the source of supply and the cut-out." The standard practice in this country is to use nothing but the enclosed type for service switches, and although the practice has not yet been quite standardised, it is becoming more and more the custom to protect the fuse or cut-out by the switch and not vice versâ: so that, in the event of a fuse requiring replacement, the terminals can be made dead by means of the switch. Under the Home Office requirements, this method is compulsory unless the fuses are of a switch-handle type which can be handled without risk of shock when the fuse terminals are alive.

In the former article already referred to, it was pointed out that, according to the Code, four two-wire and three three-wire circuits could be run in one metal tube; whereas, in this country, although there is no restriction in the Institution Rules, there are some local authorities who limit the number of conductors to four, which is, no doubt, a good practice. It is, therefore, interesting to observe that an amendment has now been made to the National Code, prescribing that not more than four No. 4 B, and S, gauge rubber-covered conductors shall be placed in metal conduit, and that no single lighting circuit shall carry more than 1,320 watts. There are many other modifications in the rules, but as these apply essentially to American practice they do not call for special comment.

#### THE KENOTRON RECTIFIER.

In the General Electric Review for March a description is given by Dr. Saul Dushman of a new device for rectifying high-pressure electric currents, called the "Kenotron" (from the Greek adjective kenos, meaning "empty," and the suffix tron signifying an instrument or appliance). This rectifier, which is one of the many products of the Research Laboratory of the General Electric Co., of Schenectady, is based upon the phenomena of emission of electrons from incandescent metals, which have been the subject of extended investigations by Dr. Irving Langmuir for several years; it will be remembered that Dr. Langmuir's results bore fruit in the development of the half-watt lamp and the Coolidge X-ray tube, and as the editor of our contemporary points out, "the construction of a high-voltage rectifier illustrates the old expression that the theory of the present may become engineering practice of the future."

The emission of negatively charged corpuscles or electrons from heated metals may be illustrated by the following arrangement. In an ordinary lamp bulb containing a tungsten or carbon filament there is also sealed in a metal plate. After the lamp is well exhausted it is observed, on charging the filament negatively (making it cathode) with respect to the plate, that a current passes across the vacuous space. If the filament is charged positively this current disappears. Furthermore, the magnitude of this electron emission (thermionic current) from the heated cathode increases with increase in the temperature of the

filament.

This effect had been observed by Edison, and was more fully investigated in the case of carbon lamps by Fleming. In view of the unilateral conductivity possessed by such an arrangement as that described above, Fleming applied it as an "electric valve" to rectify electric oscillations such as are obtained from a "wireless" antenna, and therefore to render it possible for these oscillations to affect a galvanometer or telephone.

That the current from a hot cathode in an exhausted bulb is due to a convection of electrons, that is of negatively charged corpuscles having a mass which is about 1/1800th of that of a hydrogen atom, may be shown by deflecting the current in magnetic and electrostatic fields and determining

the ratio e/n.

The subject was taken up by Dr. Langmuir, who found that in the case of heated tungsten filaments the electron emission at constant temperature increased as the vacuum improved until a constant value was attained, which varied with the temperature in accordance with an equation laid down by Richardson. In the types of hot-cathode rectifiers exhausted by ordinary methods, the electron emission is accompanied by a blue glow, and the cathode gradually disintegrates; it was found that the blue glow was due to the presence of positively charged gas molecules (ions), and that the disintegration of the cathode was due to bombardment by these ions. When the vacuum is made as perfect as possible, however, conduction occurs only by means of electrons emitted from the hot cathode, and there is no blue glow.

By means of a Gaede molecular pump in series with two other pumps, with a liquid-air trap between, the rectifier and the molecular pump, Dr. Dushman has succeeded in attaining a vacuum as high as  $5 \times 10^{-7}$  mm. of mercury. The thermionic current in a high vacuum depends directly upon the nature of the electrodes and the temperature, values for tungsten being as follows:—

Absolute temper sture.				M	illiamperes per cm².
2 000	•••	•••	•••	•••	4.5
2 200	•••	•••		•••	4 1 3
2 400	•••	•••	•••	•••	364.8
2 600		•••	•••		2,014.0

There is, however, another factor influencing the electron current, namely, the electrostatic field or "space charge," observed by Dr. Langmuir, which is set up by the electrons emitted from the hot cathode; the effect of this charge is that with a given voltage, the current increases with temperature, a coording to Richardson's equation, only up to a certain temperature, after which it remains constant. The higher the voltage between the electrodes, the higher is the

temperature at which the limit is reached, but in no case does the current at a given temperature exceed the value given by Richardson's equation, no matter what the voltage. As the absence of positive ions and therefore of gas is essential, the appropriateness of the name kenotron is obvious.

The current-carrying capacity of a kenotron, when given sufficiently high voltage between the electrodes, is limited only by the area of the surface emitting electrons and its temperature. It is necessary to limit the temperature to such a value that the life of the filament is at least 1,000 hours, and taking the life as the time required to evaporate 10 per cent. of the diameter, the following figures are obtained:—

Diam. of filament in mils.	Safe temperature (life over 2,000 hours).	Electron emission ma. per cm. length.	Heating watts per cm. length.
5	2,475	30	3.1
7	2,500	50	4.6
10	2,550	100	7.3
16	2 575	900	112

The space charge necessarily gives rise to a voltage drop in the kenotron; the current is limited to the maximum value corresponding to the temperature, and if by any chance, such as a short circuit beyond the rectifier, an excessive voltage is thrown on the latter, the instrument will be in danger of destruction. Because of the high degree of vacuum, none of the electrons lose energy by collision with gas molecules; the whole of their kinetic energy is therefore liberated as heat at the anode, like that of rifle bullets on an iron target, and the anode may thus be quickly melted. Moreover, if the anode is highly heated, rectification naturally becomes imperfect. The rectifiermust, therefore, be protected against excessive pressure, and be so designed that the space charge voltage is not great enough to cause undue heating of the anode with the normal current. It is found that about 10 watts per sq. cm. of anode area is permissible, corresponding to a temperature of 1,600° absolute, a bright red heat; at this temperature the electron emission from the anode is still less than 0.02 ma. per sq. cm.

Another important point in design is the prevention of electrostatic strains on the filament due to the high voltage, the electrostatic attraction between the electrodes being proportional to the square of the voltage. During the rectifying phase the P.D. is very low, but during the other half cycle the electrodes are subject to the full P.D. of the line. The space charge increases with the distance between the electrodes, so that they must be kept fairly close together. Various symmetrical arrangements, such as a straight filament in the axis of a cylindrical anode, a V or W-shaped filament between two parallel plates, or a headlight filament inside a molybdenum cap, have been devised to meet this difficulty. Figs. 1 to 3 are examples of these.

In fig. 1 a molybdenum cylinder A encloses a coaxial filament F. For direct-current pressures up to 15,000 volts the diameter of the cylinder need not exceed  $\frac{1}{2}$  in., while the length may be up to 4 in., with a 10-mil filament as cathode. At a temperature of 2,550° absolute the maximum current obtainable from such a kenotron is about 400 milliamperes, and the voltage drop is 145 volts.

The space-charge loss is therefore 58 watts, and the heating of the filament requires 72 watts, making a total loss of 180 watts in the rectifier, or 1.5 watts per sq. cm. of the anode, which attains a dull red heat. The kenotron is capable of rectifying 6 kw., so that the loss in the tube amounts to 2 per cent.

For D.C. pressures up to 75,000 or 100,000 volts, the diameter of the cylinder is increased to about 5 cm. A tube intended to rectify 10 kw. at 100,000 volts, with a carrying capacity, therefore, of 100 ma., had a loss of only 1.25 per cent.

The type of kenotron shown in fig. 2 is suitable for voltages not over 10,000, and currents ranging up to 100 ma.; it consists of a small filament such as is used in automobile headlights, inserted in a molybdenum cap about § in. in diameter. The loss at 10,000 volts, 100 ma., is about 5 per cent.

A V-shaped filament between tungsten plates is shown in fig. 3, the plates being 2 to 4 cm. apart. A current of

100 ma. can be carried up to 40,000 volts with a space-charge voltage of 260 volts, the temperature of the filament being  $2,500^\circ$  absolute.

With two kenotrons, connected as in fig. 4, both half waves of the current can be rectified with a connection to

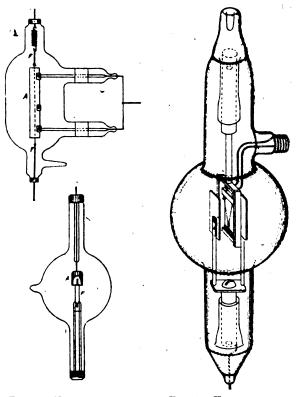

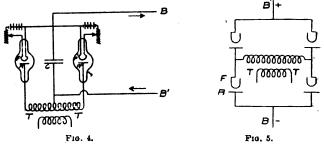

Fig. 1.—Kenotron with Cylindrical Anode, Fig. 2.—Kenotron with Molybdenum Cap.

F13. 3.—KENOTEON WITH FILAMENT BETWEEN PARALLEL PLATES.

the middle point of the transformer. Fig. 5 shows an arrangement of four kenotrons for utilising the full voltage of a transformer.

Kenotrons have been constructed for D.C. voltages up to 100,000 volts, and currents up to 1.5 amperes; the author has every expectation of extending their application to 200,000 volts. It is preferable to construct them in the form of 10-kw. units when the voltage exceeds 25.000; for lower voltages, smaller units are advisable. Unlike the mercury-vapour rectifier, they can be operated in parallel.

In the laboratory the kenotron facilitates the production of small direct currents at very high voltages, for spectroscopic work, &c., and for testing the dielectric strength of insulation. By inserting capacity between the high-pressure D.C. terminals, as at C, fig. 4, the fluctuations in the direct

TRANSFORMER.

current can be reduced to any desired extent. For the operation of X-ray tubes, the precipitation of dust, &c., the instrument is well adapted. But the author's vision is not restricted to minor uses such as these; he regards high-voltage p.c. transmission as being "very much within the limits of possibility." "To transmit 1,000 kw. by 100 kenotrons, working in parallel at a voltage of 50,000 to 75,000, is quite a feasible proposition."

## THE WAR AND THE ELECTRICAL INDUSTRY.

We have lately made further inquiries among a number of firms connected with the electrical industry in regard to the effect of the continuation of the war upon their operations.

Our inquiries related to the effect of the demands of the Government for war materials, the extent of present home and foreign business, the probable effects of restriction of municipal electrical expenditure, the wearing of badges by workprople, the shortage of skilled labour, the shortage of raw materials, and the progress being made in the manufacture of new lines and with trading operations in new

A firm of scientific instrument-makers replies as ollows :-

Home and foreign orders are about up to the average. On account of the large amount of Government work in hand, however, it is not possible to actively push foreign business. No effect of limitation of municipal expenditure has yet been felt. About 20 per cent. of the men have enlisted. It is not anticipated that many more will do so voluntarily. Service badges have been obtained, but not yet issued pending an anticipated visit from the War Munitions Committee. The shortage of skilled labour is severely felt, and is greatly handicapping output. Shortage of ray material has not been seriously felt, but there are difficulties. material has not been seriously felt, but there are difficulties,

of course, in obtaining deliveries.

Inquirers often ask for substitutes for Continental instrument makers' goods, but the pressure of Gevernment work has prevented

any serious effort to enter new foreign markets.

THE WALSALL ELECTRICAL Co., LTD., state :

We have at the present time sufficient orders to keep our works more than fully occupied. We have secured a fair amount of Continental trade, most of which, as far as we can trace, has previously been transacted by the enemy.

The restriction of municipal expenditure will not materially affect us, as the slump in our standard lines has been more than

counterbalanced by new business.

We are at present experiencing a great difficulty with labour, as omething like 33; per cent. of our staff and employés have joined

the Colours and things are not improving.

Ws are having considerable difficulty in obtaining skilled labour more so than unskilled; this is materially affecting our deliveries. Our supply of material is very much restricted, and at the present time is causing serious inconvenience.

We have certainly started to manufacture new lines formerly purchased from the Continent, but it is impossible to say to what extent this business will prosper until the present difficulties have

A well-known firm of makers of electrical instruments and apparatus writes :-

We are receiving orders freely both at home and abroad, but of course the bulk of our work is from this country, and it is largely dependent on the war. At the present moment we are not feeling the restriction of municipal electrical expenditure, but in connection with this we would point out that a large amount of such expenditure is necessary in order to keep war industries going. A considerable proportion of our men have enlisted, and we are feeling very considerably the loss of the services of the intermediate class of man. Material also is difficult to obtain, and is becoming increasingly dearer. There is always a certain amount of development going on in our works, but this is naturally directed at the present time to carrying out the various orders for the Government which we have in hand.

A large electrical manufacturing company reports:-

We continue to receive orders freely for our manufactures from bayers at home and abroad and have no complaint to make in this respect, but rather the other way about, that is, in some departments we receive orders much too freely for our comfort from the point of view of execution. We do not consider that the restriction of municipal electrical expenditure will affect us, as business from other sources will apparently fully make up for any falling off there may be due to that cause. Approximately 600 falling off there may be due to that cause. Approximately 600 of our employes have enlisted, and from time to time we continue to lose a few. No badges are worn by our workmen. In certain of our departments the shortage of skilled labour has affected us to a certain extent, but we cannot say that it has done so materially, taking into consideration the works as a whole. We have experienced difficulty from time to time through shortage of raw materials, but we have now been able to remedy this to a large extent. We have had very little opportunity to follow up new lines of manufacture in view of the fact that since the outbreak of war our works have been continuously overloaded the outbreak of war our works have been continuously overloaded with our normal lines of business.

A firm of switchgear manufacturers states :-

We are switching all our available resources on to war service work. The greater proportion of our eligible men have enlisted, and we expect within the next week or so that the whole of our staff and other employes will be en aged on war service in one Jo m or other.

A firm of engine-makers reports :-

We are devoting ourselves almost exclusively to the manufacture of engines, &b., required by the Government, and, consequently, are not seeking to secure new business either at home or abroad. The shortage of skilled labour materially affects our ou put, as it prevents us from working night-shift.

A prominent electrical firm in the Provinces, which is very extensively engaged in the supply of munitions of war, but without any hindrance to usual manufacturing and selling operation, reports that it is receiving home and foreign orders freely, and it anticipates that restriction of municipal electrical expenditure will have a considerable effect; 15 per cent. of the employes have enlisted; others are going; no badges are worn. Shortage of skilled labour is serious, and shortage of raw materials also causes difficulty. No progress is being made with new lines of manual facture, but efforts to enter new function mathets are materials with facture, but efforts to enter new foreign markets are meeting with very satisfactory results.

MESSES GENT & Co., LTD., of Laioester, are receiving orders freely for their manufactures from buyers at home and abroad. They do not anticipate that restriction of municipal electrical expenditure will materially affect them. About 15 per cent. of their staff have enlisted, and a fair number are leaving every week. War service badges are worn by their workpeople. The firm suffer a good deal from the shortage of skilled labour. At the present moment considerable difficulty is also caused owing to shortage of raw material, but great efforts are being made to overcome the difficulty. Progress in new lines of manufacture, formerly chiefly Continental, is not as rapid as they would like owing to heavy Government demands upon the works.

MESSES. VERITYS, LTD, of Lond n and B rmingham, have experienced extreme activity in all directions since the commencement of the war. The mere fact that foreign supplies have been cut off, and this country thrown on its own resources, seems to have done untold good, and without going into political or economic questions, it is believed that if, at the end of the war, some tariff wall can be erected against the aggression of the companies abroad, assisted by banks and subsidies as they are, it would be a splendid thing for the electrical industry in this country. It is all very well, during peace time, for agents over here, having small offices and employing only a few clerks, to earn a living by importing against their countrymen large masses of electrical machinery, but in times of crisis, such as the present, the weakness of this policy can be seen. The tendency hitherto has been to turn this country into a large factoring department for ment of the war. The mere fact that foreign supplies have been weakness of this policy can be seen. The tendency hitherto has been to turn this country into a large factoring department for foreign firms, whereas the backbone of the Empire is the manufacturing industries which employ Britishers; industries which are ready to supply requirements in war time, and from which alone can a permanent prosperity be assured. It the Government and municipal authorities will only recognise this and stand by the home manufacturer, there is no reason whatever why the electrical trade should once more fall into the degree of servitude which it had undoubtedly reached when hostilities were commenced. commenced.

Mr. George Verity, chairman of the company, has been appointed an Honorary Colonel of the Royal Engineers (T). He is also chairman of Charing Cross Hospital, and has had through his hands over 1,000 wounded soldiers—the care of whom is undertaken without cost to the nation. Mosery Ceritys' works director. Colonel Lister, R.E., has been transferred from the Territorial Forces to the Rayal Engineers, and as such has been in constant employment since mobilisation. He has been over in Franders, and is at present engaged in raising a further corps of Signal Troops for dispatch to the front. His place has been taken at the works by Mr. T. I'ons, long a member of the company, and Col. Verity's work is largely being carried out by Mr. Evans, sales director. Orders are being received fairly freely for the firm's manufactures from both at home and abroad, although foreign trades a networks. is naturally somewhat restricted, owing to the financial or s.s in South America and elsewhere. The restriction of municipal electrical expenditure has not, so far, affected them, and if, after the war, as stated above, the municipal councils, will only see their way to give preference to British manufacturers, as is done in Germany and elsewhere, both for big and small plant and supplies the effect of the way will be a blessing in diagnise. plies, the eff ot of the war will be a blessing in disguise.

A large number of the firm's men have enlisted, both at the sales depô.s and the works; their dependents are being looked after by the company. Recruiting from the works has now been stopped the company. Recruiting from the works has now been stopped by order of the Almiralty, who have given the directors a number of badges to be worn by men engaged on Government work, and who consider that the men remaining are doing their duty as well at the bench as in the trench. Messrs. Verity feel the effect of the shortage of skilled labour, and to some extent the shortage of raw materials, but their men have worked hard and loyally, and have largely made up for the difficulties experienced in other directions. directions.

All the firm's endeavours are being concentrated, during the war, in developing new lines of their manufactures for both at home and abroad. It remains to be seen whether they, like other British manufacturers, are going to be supported.

Swedish Electrical Exports to Canada.—Figures lately issued show that during the last flocal year, electrical apparatus valued at £185,906 was imported into Canada from Sweden, as compared with only £118,560 in 1913.

# NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### New Ironclad Switchgear.

THE MIDLAND ELECTRIC MANUFACTURING Co., LTD., of Stafford Works, Rea Street South, Birmingham, are now specialising in the manufacture of ironclad switchgear. A number of patterns are being produced, including the Paragon and Camloc ironclad switches, the Memco ironclad change-over switch, the Kantark ironclad fuse, &c.

The Paragon switch has been designed to meet the want for a low-priced totally-enclosed ironclad double or triple-pole switch. The contacts are mounted on a mica insulated bar controlled by a side lever handle, and each pole is mounted on a separate porcelain base. The cover is interlocked with the handle, and the construc-

possible effect various systems were tried, with the result that the Eye-rest system was adopted. Messrs. Rashleigh Phipps & Co. were the contractors, and the fittings were supplied by the BRITISH THOMSON-HOUSTON Co., LTD., of Mazda House, 77, Upper Thames Street, E.C. Fig. 5 shows the indirect lighting fitting as installed

tion allows easy replacement of brushes or contacts; an earthing screw is provided, and the switch complies with H.O. regulations. A Paragon combined switch and fuse unit is also supplied, in which H.O. pattern bridge replacement fuses are contained in the switch case.

The feature of the Camloc switch is its quick break; it is built on the mica and metal principle, double and triple-pole, with interlocking handle, and the mechanism gives a positive make which is effected independently of the spring. Every switch is guaranteed to withstand 2,300 volts A.C. between contacts and case. This switch is also supplied as a switch-fuse combined with the firm's standard pattern cartridge fuses.

The Memoo change-over switch—double and triple pole—is a completely enclosed ironclad switch suitable for all purposes.

Ompletely enclosed frontiad switch suitable for all purposes.

The Kantark ironclad fuse is of the replacement bridge type, of improved design, with contacts well shielded and embedded in porcelain to conform to H. O. regulations. An arc chamber is provided with ventilation slots, to prevent damage to the fuse.

The Paragon and Camloo switches are fully protected, and the design of the Kantark fuse is registered.

#### Shop Window Reflectors.

m MESSES. SIMPLEX CONDUITS, LTD.. of 116, Charing Cross Road, W.C., have just produced a range of reflectors, designed to illuminate objects displayed in shop windows in the most economical manner. These reflectors throw all the light upon the goods, and prevent the pavement in front of the shop being flooded with light, thus

FIG. 4.—SIMPLEX SHOP WINDOW REFLECTORS.

meeting the requirements of scientific illumination, and at the same time falling in with the new lighting regulations. All the reflectors are designed for easy wiring and fixing, and, at the same time, are easily adjustable.

time, are easily adjustable.

Leaflet No. 583 describes this range fully, and a copy will be sent on application.

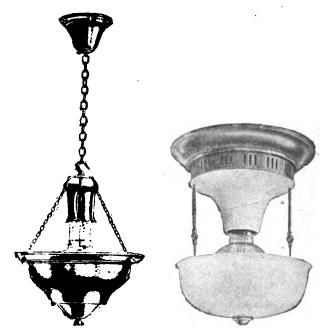

FIG. 5.—EYE-REST INDIRECT FIG. 6.—LUMINA SEMI-INDIRECT FITTING.

B.T.H. FITTINGS AT SELFRIDGE'S.

in the grocery department, on the first floor; each bowl is fitted with a BT.H. X-ray reflector, in proper focal position with regard to the filament of the half-watt lamp, which directs the light on to the ceiling. Somewhat similar Eye-rest fittings are used in the provision department, on the ground floor. In the merble market in the basement semi-indirect lighting is employed, with the B.T.H. Lumina fitting, as shown in fig. 6. The intense intrinsic brilliancy of the half-watt lamp is thus shielded from direct vision, while ample ventilation is ensured, and the illumination obtained, it is claimed, is most agreeable—an important feature in shop lighting.

#### Benjamin Half-Watt Fitting.

THE BENJAMIN ELECTRIC, LTD, of 1A, Rosebery Avenue, E.C., have introduced the new vitreous enamelled steel reflector for half-watt lamps, illustrated in fig. 7. The contour of the

FIG. 7 .- BENJAMIN HALF-WATT FITTING.

reflector is such that the filament is hidden from the direct line of vision, the most efficient illumination being produced on the working plane. The skeleton neck ensures ample ventilation, while the Benjamin Goliath holder facilitates wiring and eliminates overheating of the terminals. The fitting is adapted for 300 to 500-watt lamps.

## LEGAL.

THE PRIZE COURT.—SEIZURE OF ELECTRIC FANS.

In the Prize Court on Monday, the President, Sir Samuel Evans, gave his reserved judgment in the suit by the Crown asking for the condemnation of five cases of electric fans seiz d on board the P. and O. steamship Poona in London on October 17th last, goods were claimed by Isaria, Ltd., a company duly incorporated in England.

The PRESIDENT, giving judgment, said: The claimants to the The PRESIDENT, giving judgment, said: The claimants to the goods seized and claimed in these proceedings (which consisted of five cases of electric fans) are a company named Isaris, Ltd., which was incorporated in May, 1912, and whose registered office at the time of the outbreak of war was 208, Tower Bridge Road, in the County of London. The company carried on business in this country and abroad. The goods (with others) had been sent out to Australia for sale, and were returned to the company in August, 1914. They were seized in the Port of London as prize in the Crown's rights to droits of Admiralty on Ostober 17th, 1914. After investigation of the facts I was satisfied that the goods at the time of seizure belonged to the company. The question which remained for decision was whether, having regard to the constitutime of seizure belonged to the company. The question which remained for decision was whether, having regard to the constitution of the company, the goods were enemy properly subject to seizure. At all material times the number of shares in Isaria, Ltd., issued were 1,250 shares of £1 each. Of these 1,244 were held by Isaria Zahlerwerke, of Munich, a German manufacturing company; one share was held by each of the four directors of Isaria, Ltd., who were German subjects and resident in Germany; one other share was held by one Schoenmann, the secretary of the company also a G. rman subject. the praining the secretary of the company, also a G. rman subject; the r. maining share was held by one Vallée, who was raid to have been a French subject, but who, for some time before the war, had resided at Munich, and been employed by the German company, the Isaria Zahlerwerke. Schoenmann left this country on August 3rd last Zanierwerze. Schoenmann left this country on Abgust 3rd last for Germany, having purported to appoint one of the company's employés, Mr. Frank Morton, to be manager. Mr Morton repre-sented the company in these proceedings. After the outbreak of war he was informed by the Board of Trade that they were advised that there was no objection to the sale from stock of the company of goods imported from Germany before the war, and that no licence was required for that purpose. Later on (in November last) he was informed by the Comptroller of the Companies' Department of the Board of Trade that as Isaria, Ltd., was a company incorporated in this country, there was nothing (having regard to Sec. 3 of the Trading with the Enemy Proclamation No. 2, dated September 9th) to prevent trading with the company, or the payment to it of money which might be owing to it. So Mr. Morton appears to have carried on the business of the company; and the books and papers of the business have been inspected, when required, by the official accountant appointed by the Board of Trade. For the claimants, it was contended that the goods belonged to an English company, not to alien enemics, and goods belonged to an English company, not to alien enemies, and were not subject to seizure or confiscation. On the other hand, it was argued for the Crown that as all the directors were enemy subjects, and resident in Germany, and all the share-holders were also either enemy subjects, or resident in Germany, the goods were in reality the property of alien enemies, and ought to be condemned as such. I was referred to my decision in this Court in "The Roumanian" (1915, Probate, page 26); and, of course, to the judgments pronounced later by the Court of Appeal in "the Continental Tyre Co., Ltd., v. Daimler Co., Ltd., and v. Thomas Tilling, Ltd." (1915, I.K.B., page 893). I will only observe as to "The Roumanian" that it does not necessarily govern this case. The facts there were different in important and material respects; moreover, I think it will be found that in the course of the arguments in "the Roumanian," counsel for the claimants expressly admitted that the "Europaische Petroleum-Union Gesellschaft mit beschrankter Haftung" was a German company; and the case was dealt with accordingly. The indements in the Court of mit beschrankter Haftung" was a German company; and the case was dealt with accordingly. The judgments in the Court of Appeal in the Continental Tyre Co. cases, however, bear directly upon the point arising in the present case. What, therefore, ought I to do in this Court in view of those decisions? In matters relating to prize, the Court of Appeal does not bind this Court, for the reason that no appeal lies to the Court of Appeal from judgments given in the Prize Court. The only appellate court in such cases is the Judicial Committee of the Privy Council. If I were of opinion that different principles applied in Council. If I were of opinion that different principles applied in the present proceedings in a Court of Prize; or if I held a strong opinion upon the legal aspects, even if the same principles were applicable, I conceive it would be my duty to give effect to such opinion even though it differed from that of the Court of Appeal. opinion even though it differed from that of the Court of Appeal.

But I do not think, in the present case, different principles ought to be applied. The matter in controversy appears to me to be one which should be regarded from the point of view of municipal law; and no question of an overriding principle of international law arises. The claimants come forward as a company incorporated in accordance with the law of this country. The claim is not made by the individual shareholders—subjects of a foreign country, enemy or otherwise. The question turns upon the status of the company in this Kingdom. Accordingly, nothing in this case depends upon the bearing of the law of nations upon our municipal law. In these circumstances, I think it more respectful to the Court of Appeal to act in accordance with their judgment, however much I might feel inclined to sympathise with the dissentient views of Lord Justice inclined to sympathise with the dissentient views of Lord Justice Buckley. In the special facts of this case and of the Continental Tyre Co. cases, a decision in accordance with Lord Justice Buckley's judgment might be easy; tut it is fairly obvious that with even a alight variation of facts as to the holding of the shares, the adoption of a definite general principle as a foundation for his judgment and its application would give rise to great difficulties. Without dealing with it any further, I may observe that even in Lord Justice Buckley's dissenting judgment this passage is to be found:—"The corporation, if it be a British corporation, stands in the same position for most purposes as a British tion, stands in the same position for most purposes as a British subject. For instance, as regards rights of ownership of property and the right to protection and assistance by the law. But while it stands for most purposes in the position of a British subject, it cannot be correctly described as a British subject." The question before me deals with "rights of ownership." For the reasons stated, I am content to accept respectfully the law as laid down by the Court of Appeal, and must leave the ultimate decision to a higher tribunal. of Appeal, and must leave the ultimate decision to a higher tribunal. If the judgment of the majority of the Court of Appeal is unsound, it must be so pronounced by the House of Lords on appeal from them; or by the Privy Council on appeal from this Court. If it is affirmed as good law, but is considered to require alteration as a matter of just policy, then the Legislature must act. I desire to add one word by way of reservation. The case of the ownership of vessels registered in this country is so special, having regard to our merchant shipping legislation, that I venture to repeat what I said in "The Tommi" and "The Rothersand" (1914, Probate, page 251), and to reserve expressly all questions which might arise if it were contended that a British vessel was the property of a company constituted like that of Isaria, Ltd. The judgment of the Court is that the goods seized are not enemy property, of the Court is that the goods seized are not enemy property, and I order their release. On their release they will be delivered over to Mr. Morton, the present manager of Isaria, Ltd.; and he of course, will deal with them as belonging to the English company; and he will not be able to deliver them or their proceeds over to the alien enemy shareholders of the company or to use them or to apply their proceeds for the benefit of any such shareholders during the existence of the war.

## PATENT REVOCATION.

On the 29th ult. the Court of Appeal, composed of the Master of the Rolls, Lord Justice Phillimore and Mr. Justice Joyce, delivered udgment upon the appeal of Witcarborizing, Ltd., from a judgment of Mr. Justice (now Lord Justice) Warrington dismissing granted to John E. Jameson, Oliver H. Valpy and Edmund A. Buckle, for "Improvements in the treatment of peat and the like." One of the claims of the patent was as follows:—"In a process for the extraction of water from peat and like substances passing an electric current through a pulp of the same heated to a temperature of 100° C. under a pressure such that no steam is produced substantially as described." Appellants applied for revocation of substantially as described." Appellants applied for revocation of the patent on the grounds that it was invalid for want of utility and insufficiency of directions. It was proved that the water in peat was partly free and partly combined in the form of "hydro-cellulose," and that the partly combined in the form of "hvdro-cellulose, and that the combined water could not be got rid of by pressure as the free water could. Prior to the patent it had been suggested that the water could be removed by the use of a comparatively high temperature and pressure. The patentees (the respondents) alleged that the result could be attained by the use of an electric current the voltage of which might vary within wide limits, at a lower temperature, but the petitioners contended that the only result obtained by the use of the current was due to its heating

Mr. Justice Warrington held that the specification effect. Mr. Justice Warrington held that the specification described a process in which the electric current was used to effect the decomposition of the "hydro-cellulose" without recourse for that purpose to heat, while the sarlier process depended on the effect of heat alone; that the process was useful; and that the directions were not insufficient. He accordingly dismissed the petition with costs, and granted respondents a certificate of validity. From this decision the petitioners now

appealed.

Mr. Walter, K.C., Mr. Colefax, K.C., and Mr. Frost appeared in support of the appeal, and Mr. Bousfield, K.C., and Mr. J. Hunter

Gray for the respondents.

THE MASTER OF THE ROLLS, in the course of his judgment, aid he did not consider the experiments which had been made by said he did not consider the experiments which had been made by both sides were either satisfactory or conclusive, but, on the whole, he thought the petitioners had failed to prove that the respondents' patent was bad for want of utility. While feeling more difficulty upon the ether point as to the directions in the respondents' specification being insufficient, as alleged by the petitioners, he was not, on the whole, prepared to differ from the conclusion arrived at by Mr. Justice Warrington upon that issue. The result was that in his opinion the appeal failed and should be dismissed with costs.

LORD JUSTICE PHILLIMORE and MR. JUSTICE JOYCE delivered judgments to the same effect.

#### PIGGOTT & Co., LTD., e. HICKS & Co.

On Friday, before his Honour Sir W. Lucius Selfe, in the Maryle-bone County Court, Messrs. Thos. Piggott & Co., Ltd., engineers, Atlas Works, Springhill, Birmingham, claimed the return of £13, paid for an electric motor to Messrs. Hicks & Co., engineers, Portsdown Road, Maida Vale, W.

MR. RANKIN, counsel for the plaintiffs, explained that in February the defendants advertised a second-hand electric motor, as good as new, of 7½ H P., and the plaintiffs purchased it, paying a cheque for the amount in advance. When the machine arrived at Birmingham it was found that the coils had been fused up and that the motor was nothing like 7½ H.P. A new motor would have cost about £25, but at that date it would have taken a month to deliver it. In these circumstances, cash was paid for this motor. Counsel said that his clients had sustained considerable damage through want of this motor and having to substitute another. It cost in labour alone £7 to move one of their motors from one part of their works and install it where the additional power was needed. But for the fact that they had a spare motor, the damage

would have been much heavier.

MR. DYSON, manager of the plaintiffs' works, said that the motor was delivered on March 2nd. It was urgently wanted to complete was delivered on march 2nd. It was urgently wanted to complete a contract for steam pipes for the Admiralty, and the one supplied by the defendants not being what lit was represented to be, caused delay in the work. It was wanted to drive a lathe. When it was discovered that the coils of the motor were defective and that the horse-power was much under 7½, they had to dismantle one of their fixed motors and place it to complete the pipe contract. The out-of-pocket cost of this work was £7 5s., and the work was delayed four weeks.

four weeks.

His HONOUR: Thus you have lost more than £7?-WITNESS:

Considerably.

His HONOUR: There will be judgment for the plaintiffs for £26 9s and costs, payable in 14 days. And about the rejected motor?

COUNSEL: It lies with my clients at the defendants' risk.

## WORKMEN'S COMPENSATION.

WORKMEN'S COMPENSATION.

At Preston County Court last week, Luke Riley, labourer, 21, Pollard Street, brought an unsuccessful claim under the Workmen's Compensation Act against the United Electric Car Co., Ltd., of Strand Road, Preston. It appeared that three years ago an accident occurred to the applicant, and his leg was injured. The respondents admitted liability for payment of compensation in respect of that accident until November 3rd last, when it was contended that applicant had fully recovered and was able to do the work they offered him. Applicant declared that ulcers on his leg rendered him unfit for work.

JUDGE STURGES gave indoment for the respondents helding

JUDGE STURGES gave judgment for the respondents, holding that the ulcers had no connection with the accident. Applicant was awarded costs up to the time of the payment into Court by respondents, and the latter were awarded subsequent

#### PARLIAMENTARY.

## Aberdare Tramways.

AFTEB several days' sitting the Select Committee of the House AFTER several days' sitting the Select Committee of the House of Lords, presided over by Lord Newton, has passed the Aberdare U.D.C. Bill. The objects of the Bill are the construction of certain tramways, the provision of railless traction and motor-bus routes, and certain street improvements. The principal opponents were the Great Western Railway Co. and the Taff Valley Railway Co. MB. CLODE, for the promoters, said that the tramways of the Urban District Council, which were opened in 1913, had done fairly well, but the railless traction routes had not shown a profit. The tramway extensions proposed were from Treovynon to Hirvain, from Abergman to Commanan, and to Abergymboi. It was

from Aberaman to Owmaman, and to Abercumboi,

proposed to extend the existing railless traction routes from Abernant Road to Cwmbach and from Treoynon to Cwmbach. Sanction was asked to borrow £49,751 for the construction and equipment of the tramways and railless cars, and £8,500 for

A great deal of local evidence was called, and Mr. S. Sellon and Mr. J. B. Hamilton also gave evidence in support of the proposals.

MB. BALFOUR BROWNE, K.C., for the Taff Vale Railway Co., in asking the Committee to reject the Bill, contended that Parliament never intended tramways to run alongside existing railways to take traffic from them.

Ms. LLOYD, K.C., on behalf of the Great Western Railway Co., agreed that the proposed tramways were unnecessary and would be unremunerative.

The Committee passed the preamble except with regard to the proposed extension from Trecynon to Hirwain, which was struck

### Yorkshire Electric Power Bill.

THE Bill promoted by the Yorkshire Electric Power Co. came before the Select Committee of the House of Lords, presided over by Lord Hylton, on April 27th and subsequent days. The company, under the Bill, sought for power to supply electric current for lighting, and also provided for the division of the capital into £1 shares.

ME. FREEMAN, K.C., appeared for the promoters, and said the area of the company comprised the greater part of the West Riding of Yorkshire, but the powers of the company only allowed them to supply electric power in bulk. The authorised capital of the company was £2,000.000, and £538,000 had been expended on capital account. In no fewer than 84 districts in the area there was no body authorised to supply electric light. The opponents of the Bill mainly consisted of county boroughs, and he contended that as the company could not go inside the areas of these boroughs, they were not affected.

After hearing evidence, the Committee struck out the main clauses of the Bill, and in consequence the promoters withdrew the whole Bill.

Second Readings.—In the House of Lords, on May 4th, the Metropolitan District Railway Bill and the Ascot District Gas and Electricity Bill, were read a second time. Second Readings .-

#### OUR LEGAL QUERY COLUMN.

"Switch" writes:—"We should like the help of your Legal Column with regard to a question of trading with the enemy. The matter is probably one in which several readers find themselves, and we think is, therefore, of general interest. Should you mention the matter in your paper, we must ask you, for obvious reasons, not to mention our name in any way. The position is that in the past we had various apparatus made for us in Germany; the actual orders were placed with the agent of the German in this country, who is either an Englishman or a neutral. The orders were made out to him; the invoices we received were on the German manufacturers' paper, with a note on the bottom: 'Payable to our agent, Mr. . . . . in London.' The cheques were paid by us to this agent. Since the outbreak of war we have made arrangements to have the apparatus made in this country, and for various reasons have had to place contracts for some time ahead. We wish to know how we can take steps to have the remainder of the outstanding orders with the German manufacturers legally cancelled. We might say that the orders given to the agent in London mentioned a definite number of pieces but generally stated 'Delivery as required.' Thanking you in anticipation for any assistance you can give us."

*** An executory contract concluded with an alien enemy before selves, and we think is, therefore, of general interest. Should

*** An executory contract concluded with an alien enemy before the outbreak of war is merely suspended during the war as regards the right to performance and the right of action. But such a contract is either avoided or dissolved by the outbreak of war (1) if it enures to the aid of the enemy, or (2) if it is in its nature incapable of suspension. A contract will in its nature be incapable of suspension if (inter alia) its proper performance necessitates intercourse with the enemy during the war. The above are the principles of law (apart from the law as defined by various proclamations) which govern the question propounded. It would seem that if any payment made to the English agent were to have been by him transmitted to his German principals, it would be seem that if any payment made to the English agent were to have been by him transmitted to his German principals, it would be illegal. By the Trading with the Enemy Proclamation (No. 2), Art. 5, any person resident, carrying on business, or being in the British Dominions is warned—(1) Not to pay any sum of money to or for the benefit of an enemy. It is true that if an enemy has an agent in this country duly appointed before the war, payment to such agent is not a crime, although the money must not be transmitted by him to his principal (see Kershaw v. Kelsey (1868) 100 Mass. 561). In these circumstances inasmuch as our correspondent will probably have no means of knowing whether money pondent will probably have no means of knowing whether money is being transmitted to Germany or not, to continue to trade with the agent will be a very dangerous proceeding, and it is difficult to understand why he need take steps to have the orders legally cancelled. All that is necessary for him is to serve a notice saying that he does not propose to accept any more goods under the contract. He would do well, however, to consult a solicitor.

#### CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### The Engineering Industry and the War.

Many will read with great interest your valuable article entitled "The Engineering Industry and the War," and I should like the favour of a portion of your space to make a

few remarks thereon.

I believe that zeal without knowledge is frenzy, and I believe that the basis of the genius of our high national civilisation exists in the preventative, constructive and aggressive resources of which our professional engineers are the masters and particular energials.

resources of which our professional engineers are the masters and national custodians.

I have asked a friend to put down a question in Parliament upon this subject, because I find, upon discussing the matter with a number of Members of Parliament, and in other obvious patent ways, that the nation knows little or nothing of the vital asset represented by some 12,000 professional engineers appearing in the published lists of the Institutions of Civil, Electrical, and Mechanical Engineers.

I know the medical profession in many countries, and

I know the medical profession in many countries, and having met them in consultations, can testify in many ways having met them in consultations, can testily in many ways that they have little or no knowledge of the important subject of the industrial performance capacity of male or female individuals. Try any medical man you like, and he does not know that the average female heart pumps blood as 3 is to 5 of the average male; it seems incredible, but they do not know this simple fact in their line, and yet the blood pumped but the beautiful measure of industrial proformance.

by the heart is the measure of industrial performance.

In the area of the sacrum it is the same, and these are the biological laws governing weight-lifting and carrying capacity as well as reserve power for overtime and special sustained mental or physical efforts.

as well as reserve power for overtime and special sustained mental or physical efforts.

Engineers are the only professional men who graduate in actual labour experience and know how to get those results from individual output which are so essentially a part of the uniform national effort in every part just now, without the absurd long hours and overstrain which are doing great general injury unnecessarily.

In a letter it is impossible to do justice to the capacity and responsibility of the trained engineer, but we have, whatever one may say, to thank Parliament for the information given last week, that the Admiralty retains eight medical men at £5,000 per annum.

But where are the engineers? How many engineers are retained by the whole Empire at £5,000 per annum? Germany is fighting us with engineers, not with doctors. The greatest preventative and aggressive medicine is engineering, not physics and surgery, and the great Dr. Erlich has lowered himself when he declares "this is a doctors' war."

If the Germans will withdraw their engineers out of the war we will withdraw our doctors, and in that case in three weeks we should be in Berlin.

One is glad to see professional men retained at £5,000 a

weeks we should be in Berlin.

One is glad to see professional men retained at £5,000 a year, which a good man is honestly worth to sustain the burden of his position. But, may we not see, since war always has been an engineering job, our prominent engineers placed in prominent positions and paid like doctors and lawyers in the interests of the State? Why have we an Engineering Committee on the production of munitions of war presided over by a lawyer, and no professional engineer listed by the great British engineering institutions, not one, upon that Committee? Committee?

J. Sutherland Warner, A.M.I.Mech.E.

London, W., April 30th, 1915.

## . Mathematical Notation.

With reference to my proposal which you published in last week's issue, I had sent to Prof. A. E. Kennelly, of Harvard University, a fore copy of the same, and in an appreciative answer, he thinks the suggestion a very good one, and "hopes it will be earnestly advanced with a view of winning its ultimate adoption." This though, he says, he believes he was the first to introduce, about 1893, the self explanatory form of notation  $r/\underline{n}$ ; but I deem it would not take long for any interested in the subject to accept the dagger with its simple memoria technica for positive and negative angles.

F. Jacob.

Lendon, S.E., May 3rd, 1915.

Batteries for Submarines.—Hitherto, we learn from American sources, only lead batteries have been used on board submarines. It is reported, however, that an Edison nickel-iron battery is to be installed in a U.S. submarine which is now under construction.

British Industries Fair.—Buyers who have not received invitation cards for this Fair, which opens on May 10th, at the Agricultural Hall, Islington, should communicate at once with the Board of Trade at 32, Cheapside, E.C.

#### WAR ITEMS.

Municipal Employés and the Manufacture of Munitions.— A census of municipal electricity and tramways employés who can be spared for the making of war munitions has just been taken in Bolton, Wigan, Bury, Salford and other areas of central and south-east Lancashire. It is understood that a considerable number of such employés are available. The Northampton Tramways Committee has reported to the Town Council that if a 10 minutes' service is adopted, 43 men could be released in order that they may be engaged in the manufacture of war munitions. The most suitable men are to be selected by the Committee. The Lighting Committee of the Leyton District Council has approved a scheme whereby the mechanics at the works will be enabled, in their own time, to assist in the manufacture of spare parts Municipal Employés and the Manufacture of Munitions.in their own time, to assist in the manufacture of spare parts for transport motors for war purposes, the material being supplied by the Associated Equipment Co., who will pay the men for work done.

After the War.—The Fulham Electricity Committee recommends that the Council undertakes that, when engaging new hands after the war, preference shall, as far as possible, be given to those who have served their country under arms or in making munitions of war.

War Bonus.—In view of the greatly increased prices of household necessities caused by the war, Messrs. J. & W. B. Smith have decided, quite voluntarily, to pay from April 24th a special war bonus to all their employés for the duration of the war.

Siemens's Employés with the Forces.-We have received a copy of a booklet of 46 pp., issued in April, giving the names of employes of the Siemens Companies who are now serving in H.M. Forces. These are set out alphabetically, with particulars of the department in which employed (offices, branches or works), and the unit and rank now held. Copies of the booklet are being distributed among all the more who now purpose well over 1000.

held. Copies of the booklet are being distributed among all the men—who now number well over 1,000. Still more have enlisted since the booklet was printed.

Blackpool Electrical Employés.—Of the men who were recently engaged in the Blackpool Corporation electricity department, 31 are on military service and six are engaged in the making of munitions. The tramways department has a staff of 190 men. There are only seven single men has a staff of and continuously departments and four have in the office and engineering departments, and four have dependents. On the traffic side there are eleven single men of military age, but eight have been pronounced medically unfit for service, and two of the remaining three have dependents. There are 49 tramway employés serving in the Forces.

Board of Trade Assistance.—The Board of Trade Commercial Intelligence Branch has issued list No. 18 of inquiries received during the week ending April 24th for names of suppliers of goods.

Government Cable Contracts.—Replying in the Parliamentary papers to Mr. Booth, Mr. Beck, as representing the First Commissioner of Works, said that his department had recently given a contract to the Union Cable Co., Ltd. The principal holding was in German hands, and while the managing director, Mr. Blackwood, was an Englishman, the other four directors were German. The works were at Essex and a number of English people were employed, and not a penny of profit of any kind went to the German people. The action of the Office of Works in the matter was in accordance with the policy laid down for them, in common with other departments, by the Government in the Trading with the Enemy Act.

The Position in Brussels.—M. E. Janssens, writing from

ment in the Trading with the Enemy Act.

The Position in Brussels.—M. E. Janssens, writing from 24, Budge Row, E.C., gives the following report of the situation of the electrical trade in Brussels, which has been handed to him by a neutral subject who has just returned from that town:—"All things are very quiet. The tramway companies are running a few cars on each of their services; this, with the consent of the German authorities, who have taxed their receipts heavily. A number of factories are considering—now that no orders are in hand—the manufacture of a lot of articles quite out of their lines, thus increasing their output to a maximum. 'Energie and Lumière' employ actually 15 per cent. of their personnel to make new types of electrical apparatus, and although engaged solely in that line before the war, have now started, as a side line, the manufacture of sanitary appliances! The Belgian manufacturers are busy in studying new devices. as a side line, the manufacture of sanitary appliances? The Belgian manufacturers are busy in studying new devices, in improving the existing types on the market, and in increasing the output of their works, while their representatives are in England searching for sound connections."

Newcastle Electrical Manufacturers and War Munitions.—At a special meeting of the electrical section of the Newcastle-on-Tyne Chamber of Commerce, held on Friday last, to take into consideration the question of expediting the production of munitions of war, it was unanimously resolved that the members of the section should offer their individual help in their spare time to the Munitions of War Committee in any capacity. It was further agreed that all firms represented in the electrical section should state to the Munitions of War Committee what special work they were able and willing to do for the Admiralty or War Office. The opinion of the Committee is also to be sought as to whether the Newcastle Electrical Manufacturers and War Munitions.

section should approach similar bodies and ask for promises

of individual help, should it be required.

Kieff Electrical War Tax.—The Governor of Kieff has notified the Electrical Company of the town that the local Duma has decided to levy a war tax of 5 per cent. on the sums paid for electric light, and asks the company to recover from the users. On the request from the company for instructions how to act in the event of the subscribers refusing to pay the tax, the Governor has admitted its inability to sue, and it has to refer cases of recalcitrancy to the town authorities.

ability to sue, and it has to refer cases of recalcitrancy to the town authorities.

**Russia:** Catalogues Wanted.**—Catalogues and price lists are wanted by Bracia Borkowscy, electrotechnical depôt, Warsaw, Al. Jerozolimska 56.

**Russia.**—Several agents in Warsaw are anxious to secure representation there for British manufacturers of electrical goods and fittings and high-voltage goods. Application should be made to the Board of Trade Commercial Intelligence Branch in London.

**German Exports to U.S.A.**—The President of the Board of Trade states (says the "Times") that the imports into the United States from Germany were valued at £12,222,000 in the seven months ended February, a decrease of 48 per cent. Imports from the United Kingdom, however, were valued at £29,824,000, as compared with £34,413,000 in the earlier period, a decrease of only 13 per cent. Imports from Germany, though higher in January, 1915, than in preceding months, owing mainly to large imports of dye stuff and fine chemicals, were lower than in the corresponding month of 1914, and showed a heavy decline in February.

**Engineers' War Wages.**—The Amalgamated Engineers in Ashton-under-Lyne, Stalybridge, Dukinfield and Hyde have had their wages advanced 3s. per week on time rates and 7½ per cent. on piece rates, to be recognised as war wages, and as due to and dependent upon the existence of the abnormal conditions now prevailing in consequence of the war.*—

"Financial Times."

conditions now prevailing in consequence of the war. "Financial Times."

The Future of British Engineering Trade.—In the course of an editorial on "War Engineering Organisation and Future Trade," the "Engineer" writes:—That an idea of utilising the present war organisation for peace requirements is taking root in the minds of manufacturers may be gathered is taking root in the minds of manufacturers may be gathered from the suggestion put forward by Mr. Arthur Balfour at a recent meeting of the British Foundrymen's Association at Sheffield. Mr. Balfour, who is a well-known Sheffield manufacturer, is clearly one of those who recognise that an opportunity has arisen for shaping the destinies of the British engineering industry, and for striking out on new lines. If his advice be followed, then the war, however heavy the opinion is put forward that Sheffield firms, and the criticism applies with equal force to other centres of production, are at present handicapped in their organisation by having too many articles to make in a single works, and it is recommended that the existing close co-operation between different works should be continued after the war, and that groups mended that the existing close co-operation between different works should be continued after the war, and that groups of manufacturers should work together, the production of different commodities being allocated by arrangement among the various establishments. Such a proposal is not, of course, entirely novel, but it ought to make a special appeal at this juncture, when the future of British engineering is to a certain extent in the melting-pot, and the industry will shortly be face to face with new conditions. There can be no question that when Germany realises that her attempt shortly be face to face with new conditions. There can be no question that when Germany realises that her attempt to dominate the world by force of arms has resulted in failure, she will seek by a fresh and more aggressive campaign than in the past to retrieve her fallen fortunes in the commercial arena. She will, however, start under material disadvantages, for by her conduct of the war she has antagonised the whole world and squandered the goodwill in overseas markets created by years of patient effort. It will be a long time before her manufacturers can hope to live down the obloquy her soldiers have brought upon themselves in the field. The interregnum in German commerce thus created should be the opportunity of a home industry, which, without any slavish imitation of German methods, should by then possess many of the advantages of scientific organisation, and be prepared for the adaptation of the new machinery of commerce to the needs of consumers."

No War Bonuses for Single Men.—A special joint com-

No War Bonuses for Single Men.—A special joint committee of the Stoke-on-Trent Federated Council recommended that a war bonus of 2s. a week be paid to all employés of the Corporation receiving 30s. a week or less, and 1s. to employés receiving between 30s. and 40s., the recommendation not applying to employés under 21 years of age. When the matter was before the Stoke-on-Trent Council last week, an amendment was put that the bonus should not be given to unmarried men eligible for military service, but this, was lost, it being stated that many single men were compelled to remain at their work with the Corporation and others had mothers to support. Another amendment was moved that all single men be excluded from bonus benefits, but eventually it was resolved that the bonus should not be given to single men except in cases where they were the sole support of one or both parents.

Labour at War Factories.—The following new regulation has been added under the Defence of the Realm Act in relation to labour employed at works where war munitions are manufactured:—"8b. The occupier of a factory or workshop the business carried on in which consists wholly or mainly

in engineering, shipbuilding, or the production of arms, ammunition or explosives, or of substances required for the production thereof, shall not, nor shall any person on behalf of the occupier of such factory or workshop, either directly or indirectly, by canvassing, advertisement or otherwise, take any steps with a view to inducing—(a) any person employed in any other factory or workshop, being a person engaged on work for any Government Department or otherwise servany steps with a view to inducing—(a) any person employed in any other factory or workshop, being a person engaged on work for any Government Department or otherwise serving war purposes, to leave his employment; or (b) any person resident in the United Kingdom at a distance of more than ten miles from the occupier's factory or workshop, to accept employment therein, otherwise than by notifying vacancies to a Board of Trade Labour Exchange; and in the event of any person contravening the provisions of this regulation he shall be guilty of an offence against these regulations."

Switchboard Service in Wartime.—We are informed that many men have already been enrolled as full-time or part-time switchboard attendants to release younger men for service in the Army. Electrical engineers willing to assist for half-night shifts on alternate nights are wanted in the following districts:—Hammersmith, Wandsworth, Tooting, Streatham, Clapham, Stockwell, Battersea, Camberwell, Holborn, Cannden Town, Islington, Mildmay Park, Clapton, Hackney, Limehouse, Barking, Poplar, Woolwich, Lewisham, and Forest Hill. Further particulars can be obtained at the offices of "Electrical Engineering."

Roll of Honour.—Private Whiteside, of the 5th King's Own Royal Lancaster Regiment, who has been killed at the front, was formerly employed at the Lancaster Electricity Works.

Private Alfred Jones, aged 34 years, of Crewe, who has died at the Cambridge Military Hospital from meningitis served.

tricity Works.

Private Alfred Jones, aged 34 years, of Crewe, who has died at the Cambridge Military Hospital from meningitis, served for a time at the Salford Electrical Engineering Works, under Mr. Donal Fraser. More recently he had been an assistant examiner in the Patent Office.

We regret to learn that Second Lieutenant John Chamberlain, of the South Wales Borderers, is reported wounded. Lieut. Chamberlain is well known to many of our readers by reason of his connection with Messrs. Chamberlain and Hookham, Tubes, Ltd., and various other businesses. We are glad to be able to state that up to the time of writing he is making fayourable progress.

are glad to be able to state that up to the time of writing he is making favourable progress.

Engineering readers will, we are sure, join us in expressing sympathy with Professor Archibald Barr, of Glasgow, whose second son, Lieut. J. Y. Barr (B.A., Oxford) was killed in action on April 25th at the age of 23 years.

Private J. Burns, formerly employed by the St. Helens Cable Co., has been at the Base Camp, Havre, for some considerable time, suffering from a frost-bitten and septic foot.

foot.

Personal.—Last Tuesday's "London Gazette" contained the following appointment:—Territorial Force—No. 4 Electric Lights Company, Devonshire (Fortress) Engineers: George Owen Tipping to be Second Lieutenant. May 5th.

# BUSINESS NOTES.

Book Notices .- Model Power Boats. By E. W. Hobbs. London: Percival Marshall & Co. Price 5s. net.—So far as we are aware, this volume is unique in scope, and certainly its excellence entitles it to become the standard treatise on a subject which is as important from the scientific and technical standpoint as from its social and sporting interest. The building of model boats of every description and the determination of their excellence of design by speed trials constitutes a useful method of naval architecture and research architecture and research.

This the author clearly recognises, and emphasises it by devoting great attention to the naval architecture of small craft, and the treatment he gives to the subject is such that those who wish to great attention to the naval architecture of small craft, and the treatment he gives to the subject is such that those who wish to build and run their vessels on thoroughly scientific lines will find all the necessary information herein. Those who do not feel disposed to take their sport so seriously will yet find the "theoretical" sections of the book helpful in explaining facts which could only be learned otherwise by costly experience, while the exclusively practical chapters will be of interest to every reader engaged in model boat work or contemplating its performance—whether professionally or as a hobby. After a brief historical survey of model power boating and a review of the sporting and social aspects of the pastime, the author illustrates and describes over 30 different classes of models and explains the merits of each. Chapter III, explaining how and why a boat floats upright and how this result may be secured, should save many painful experiences of certain phases of application of Archimedes' principle. The next chapter deals with resistance and propulsion in sufficient detail to enable the reader to design his boat on rational lines, the precise steps to be taken being set out in the next chapter. Alternative methods of hull construction are then discussed: the reader is left free to adopt whatever type and size of vessel he desires, and is given all the information necessary to enable him to carry his ideas to a successful issue. The next five chapters deal with the power equipment of the vessel. The general construction, method of working, merits and selection of steam engines, boilers, burners, petrol engines and selection of steam engines, boilers, burners, petrol engines and

electric motors are described and liberally illustrated. It is interesting to note that small steam engines are rated by watts, and this convenient power unit is adopted in many other parts of the book. The treatment of electric motors for propelling purposes is very elementary, but possibly sufficient; the possibilities of nickel accumulators should surely be mentioned. Deck fittings and the fitting-out of models, on which appearance and success so much depend, form the subjects of two chapters, and the work is terminated by an excellent chapter on power boat racing and a glossary of technical terms.

Improved Four-Figure Logarithm Table. By G. C. McLaren London: Cambridge University Press. Price 1s. 6d. net.—The arrangement of the tables in this work is excellent; with the aid of a thumb-index, and well-chosen spacing of the lines, the log of any number can be found in a few seconds. The printing and paper are equally satisfactory. Difference columns, which form an essential feature of some so-called "four-figure" tables, and which are an unmitigated nuisance in use, are here dispensed with, three figures being in the first column and the fourth at the top of the page. The author has introduced an improvement to surmount the difficulty due to approximation in the fourth figure; the log of 5024, for instance, to six places is 701050; in a four-figure table, shall it be entered as 7010 or 7011? The author writes 7010. in this case, and for the log of 5023 (700963) he writes 7009; the single dot representing "about one-third" and the double dot "about two-thirds," and being taken into account accordingly in the use of the tables. He claims that this reduces the possible error in the fourth figure from 5 to 1, as compared with ordinary four-figure tables.

This may be true; time does not permit of our working out the large number of examples necessary to verify the statement, but it is clear that a closer approximation can be obtained in this way. Another innovation seems to us somewhat risky. In order to facilitate the use of logs by those whose mathematical knowledge is of the scantiest, Mr. McLaren dispenses almost entirely with the use of the index, and works only with the mantissa, the position of the decimal point being found by inspection. Up to a point this is quite feasible, but it limits the range of operations to multiplication and division—the user would be at sea in finding the root of a fraction, and even in multiplying or dividing decimal fractions it is easy to fall into error.

Reid's Handy Colliery Guide. Newcastle-on-Tyne: Andrew Reid & Co., Ltd. Price 2s. 6d.—This is a new edition of a guide and directory to the coal industries of the North of England (North-umberland, Durham and Yorkshire). It contains a map showing the collieries, railways and stations in these three counties, also a copy of the Coal Mines Act, 1911, with various statutory rules and orders issued since that Act came into force. The collieries are particularised, in tabular form, as to company, colliery, situation and station, agent, manager, and engineer, and in other sections alphabetical lists appear of agents, managers, and fitters. The special rules relating to the use of electricity in mines are given in full. Some pages of miscellaneous information, formulæ, &c., by T. R. Blackett, occupy the closing pages.

"Journal of the Institution of Electrical Engineers." Vol. LIII, No. 247. May 1st, 1915. Price 3s. 6d.—This issue contains papers on "The Power Supply of the Central Mining-Rand Mines Group," by J. H. Rider, and "Methods of Testing the Scherbius Compensator," by A. A. Ahmed.

"Bulletin de la Société Internationale des Electriciens." Vol. V. No. 41. April, 1915. Paris : Gauthier-Villars. Price 3 fr.

"Journal of the Tramways and Light Railways Association." London: Caxton House.—The April number contains a full report of the House of Lords' Judgment in the case of The L.C.C. r. Islington Assessment Committee.

"The Year-Book of Wireless Telegraphy and Telephony." 1915. London: The Wireless Press, Ltd. Price 3s. 6d. net.

Mesers. William Hodge & Co. announce the early publication of a Supplement to "The Law of Contract during War," by Prof. W. F. Trotter, bringing the law up-to-date.

A Minister of Commerce.—At the annual meeting of the Association of Trade Protection Societies of the United Kingdom, which is to take place in London on Tuesday and Wednesday next, several resolutions will be submitted, sgitating either for a Minister of Commerce, or for a special Government department charged with trade, industry and commerce only. It is proposed to forward to the Prime Minister and the President of the Board of Trade the expressed hope of the Association that even while the war is proceeding such a department may be organised. The Association saks that a Minister of Commerce shall be appointed to maintain relations with British Consuls abroad, with a view to increasing the export of British manufactures, and that British Consuls in all important countries should be British subjects, with instructions to make frequent reports on trading requirements to the said Minister.

American Foreign Trade.—Reuter's agent in Washington states (according to the Financial Times) that commercial experts in New York and Washington are at present deeply engrossed in the question of the possibility of domestic manufacturers forming combinations of selling agencies abroad for the promotion of foreign trade. It is believed that such a selling agency plan, a detailed arrangement of which has recently been drawn up and recommended by the Advisory Committee of the United States Chamber of Commerce, is indispensable to the growth of American commerce on an international basis,

Private Arrangements,—Allen & Grosse, Ltd., electrical engineers, Queen Street, Belfast.—A meeting of the creditors was held on April 27th, in Belfast, when a statement of affairs was submitted, showing liabilities £1,763, and assets estimated to produce £712. After allowing £25 for the claims of preferential creditors, the net assets amounted to £687, an apparent deficiency being disclosed of £1,077. It was reported that the company was formed about three and a half years ago, but had only traded with success during the first 12 months, and for the past two and a half years it had been working at a serious loss. A lengthy discussion ensued, and no resolution was passed, but it was suggested and arranged that three of the creditors present should look into the assets and report to an adjourned meeting. The following are creditors:—

Albion Electric Stores Brotherton Tubes & Conduits,	£14	Newtons, Ltd. Pritchetts & Gold, Ltd	••	£29 136

Electrical Wholesalers' Federation.—An interesting registration notice appears in our "New Companies Registered" section to-day. The Electrical Wholesalers' Federation, Ltd., has been formed for a number of purposes there set forth, with offices at Amberley House, Norfolk Street, Strand, W.C. The number of members is declared not to exceed 100, but the Committee may register an increase. The subscribers who constitute the provisional Committee are:—Mesers. M. Beales, F. Pooley, R. W. Smith, F. S. Smith, and A. G. Beaver, all of London; P. L. Davies, of Liverpool; and G. O. Donovan, of Birmingham.

Bankruptcy Proceedings.—G. Burgess (Granville Burgess & Co.), electrical engineer, 27, Museum Chambers, Bury Street, W.C.—A first and final dividend of 11½d, in the & is payable on May 7th, at Bankruptcy Buildings, W.C.

Patent Restoration.—An order has been made for the restoration of Patent No. 26,034 of 1909, for "Improvements in means for imparting stability to unstable bodies," granted to Louis Brennan.

Cheltenham Electricity Department.—The address of this department is now:—Municipal Offices, Promenade, Cheltenham. The telephone number of the offices will be 1001, and for the works, as before, 106.

Catalogues and Lists.—THE LANGDON-DAVIES MOTOR Co., LTD., of 110, Cannon Street, London, E.C., has issued a handy pocket memoranda book, containing insurance coupon, and a number of useful tables. Standard sizes and types of the firm's motors are particularized also in tabular form.

number of useful tables. Standard sizes and types of the firm's motors are particularised also in tabular form.

"K. & W." SOAP FOUNTAIN Co., 8, Bream's Buildings, London, E.C.—Particulars of their liquid soap fountains, which are used in many workshops with economical results—the soap cannot be left in the water or stolen.

in the water or stolen.

CAMERON SALES ORGANISATION, 9-10, Southampton Street,
London, W.C.—Eight-page illustrated and descriptive price list of
"White Cross" electric vibrators.

MESSES, BENJAMIN ELECTRIC, LTD., 1A, Rossbery Avenue,

MESSES. BENJAMIN ELECTRIC, LTD., 1A, Rossbery Avenue, London, E.C.—Illustrated leaflet describing a new Benjamin half-watt reflector for lamps up to 500 watte. The company announces an advance of 10 per cent. in the prices appearing in this circular, also in those appearing in their L5 catalogue (excepting Section 4).

MESSES, E. S. HINDLEY & Sons, Bourton, Dorset.—Illustrated leaflet describing their vertical oil engines for electric lighting, and their two graph compound englosed steam engine.

their two-orank compound enclosed steam engine.

MESSRS. FIELDING & PLATT, LTD., Glonoester.—Eight-page illustrated pamphlet describing the Fielding semi-Diesel orude oil engine. The firm makes engines ranging from 11 B.H.P. to 300 B.H.P.

MESSRS. DONOVAN & Co., 47, Cornwall Street, Birmingham,— Eight-page pamphlet, setting out prices of a large variety of electrical accessories, fittings, bells, batteries, cables, starters, &c.

L.C.C. Contract Prices.—This week's agenda of the L.C.C. contains the following:—"Regulation No. 662 provides that, in cases in which the publication of the estimated value of a contract for stores, &c., may lead to the disclosure of the individual price or prices quoted, the particulars, instead of being included in the report of the Stores and Contracts Committee, shall be laid on the table for the information of members. The considerations which led the Council to make this regulation appears to apply equally to the stores, &c., purchased through the Highways Committee, and we recommend:—'That Regulation No. 662 be amended by the insertion before the word 'Stores' of the words 'Highways Committee or the'; and that the regulation, as so amended, be approved."

 $\mathsf{Digitized}\,\mathsf{by}\,Google$ 

Liquidations. — HARROW ROAD AND PADDINGTON TRAMWAYS Co., LTD.—A meeting will be held on May 31st at 2 and 3, Norfolk Street, W.C., to hear an account of the winding up from the liquidator, Mr. A. R. Abbott.

RAPID LIGHT COSTROLLING SYNDICATE, LTD.—A meeting will be held on May 31st at 7, Victoria Street, S.W., to hear an account of the winding up from the liquidator, Mr. R. H. Pritchard.

ELECTRIC RAILWAY SIGNALLING SYNDICATE, LTD.—This company is winding up voluntarily, with Mr. C. F. Palmer, of 1, Broad Street Avenue, E.C., as liquidator.

Trade Announcements. -- Mr. G. Braulik, 8, Lambeth Hill, London, E.C., has been appointed sole selling agent for the United Kingdom and British export of a quick water heater for washstands patented by H. Löfquist, of Stockholm. We have received an illustrated leaflet describing the apparatus.

MESSES. FIELD & Co., electricians, have opened premises in Station Street, Burton-on-Trent.

Premises at 38, Southport Street, Barnstaple, have been taken by Mr. F. Bickford, electrical engineer.

Mr. Hanson Perry, electrical engineer, of Douglas, Isle of Man, has removed his offices to Cronkbourne Road. His stores remain at 28, North Quay.

- Messrs. G. St. John Day Advance. -(PATENTS), LTD., of Oldham, announce that owing to material and labour costs having advanced, their prices are increased by 10 per cent. from May 2nd.

## LIGHTING and POWER NOTES.

Aberdeen.—According to a statement by the city electrical engineer, 34 men of the department have enlisted, and to prepare for next winter, and to keep the works running it has been necessary to train the clerical staff as switchboard attendants. The number of power consumers since the opening of the war has increased by 17, and over half a million more units were generated during the first seven months of the war as compared with the returns of the corresponding period in the previous year.

-PRICE INCREASE.—The Chamber of Commerce Acton.has lodged with the U.D.C. a protest against a proposed 10 per cent. increase in the charges for current by the Metropolitan cent. Increase in the charges for current by the Metropolitan Electric Supply Co., it being pointed out that the legal maximum charges were already being paid. The Council has decided to point out to the company that an increase of 10 per cent. would press somewhat hardly on consumers, and suggest that any increase should not exceed 5 per cent.

Australia.—The Electricity Committee of the Sydney Municipal Council recommends that, as the replacement parts for the steam turbine, which broke down in June, 1914, are being fixed in place, the order on the British Westinghouse Co. for a complete

of installing electric light and the extension of the Gas Co.'s contract has been deferred pending the result; in the meantime the engineer has been instructed to secure the site for a power house. -Tenders. house.-

The Poowong and Jeetho (Vic.) Shire Council has appointed Mr. V. J. Crowley, of Melbourne, to report upon the electric lighting scheme of Korumburra and to supervise the complete overhaul of the plant.—A. M. Standard.

-The U.D.C. having Barking. — Proposed Loan. applied for a loan of £18,000 for electricity purposes, the L.G.B. has intimated that unless the expenditure is necessary for military purposes, it would be unable to sanction a loan at the present time. The Council has requested the L.G.B. to hold a local inquiry with regard to the loan.

Basingstoke. — Loan Sanction. — The L.G.B. has sanctioned a loan of £4,100 to enable the T.C. to extend the mains to the works of Mesers. Thornycroft. The cables are also to be extended to the works of Mesers. Mussellwhite, at Eastrop.

Blackburn.—YEAR'S WORKING.—The surplus profit on the year's working of the electricity department, amounts to £2,348, compared with £5,037 last year. Sales of energy realised £43,334, or £1,103 less than last year. Generation of electricity cost £13,798, or £376 less than last year; distribution £2,938, being £270 more; lamps, fittings and motors £2,831, £406 more; rates and taxes £2,481, £56 more; and management expenses £2,437, or £62 more.

The Corporation has given formal notice that application has been made to the B. of T. for consent to erect a generating station at Rishton.

Black Rock (Co. Dublin).—E.L. Scheme.— U.D.C. has received the Local Government Board's sanction to its electric lighting scheme, and will proceed with it on securing Treasury sanction for borrowing the necessary funds.

Bootle.—Bulk Supply.—The T.C. has applied to the B. of T. for consent to supply current in bulk to the Liverpool District Lighting Co., Ltd., and the B. of T. has intimated its intention to make the necessary order.

Bridlington.—Refuse Destructor.—The T.C. has decided to renew its application to the L.G.B. for an inquiry to be held relative to the provision of a refuse destructor for the town.

Chelmsford.—Suggested E.L. Purchase, &c.—The T.C. has accepted a rebate of £200 on the public lighting contract from the Electric Supply Corporation in respect of restricted lighting, and has referred the question of any further reduction to a Sub-Committee. The Lighting Committee is to consider the question of exercising the option of purchasing the undertaking of the Electric Supply Corporation, for which formal notice has to be served before January 20th next.

Colne.—For the year ended March 31st, there was an increase of 95,679 units in the quantity of electricity sold as compared with the previous year.

Connah's Quay.—Prov. Order.—The U.D.C. has been informed that the B. of T. will not extend the area of supply under the prov. order for E.L. beyond the Council's district, and that the order was being made upon that condition.

Continental.--Russia.--Messrs. Siemens & Halske hold the contract for electrically lighting the town of Voronezh. The town is going to use its option of buying the company out on November 23rd this year, and will build its own electric station for lighting and traction, and raise a loan of 1,025,000 roubles for this and other purposes. It intends to reconstruct the old electrical

Coventry.—YEAR'S WORKING.—The annual report of the electricity department shows that the revenue for the past year amounted to £77,913, as compared with £71,207 in the previous year. The net profit on the year's working was £22,829, as against £21,749 in the previous year. The Committee recommends that £6,000 be transferred for the relief of rate. The test lambaged profits of the relief of rate and the second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second total number of units sold increased from 16,508,338 to 20,249,018, an increase of 3,740,680.—Birmingham Daily Post.

Derby.-Proposed Loans.--The E.L. Committee of the T.C. recommends application to the L.G.B. for sanction to loans of £3,488 for mains, and £569 for motors, already expended; and for £1,000 additional for mains and motors for supplies for war purposes only.

Dublin .--Basing its calculations on the probable prices, the Corporation Improvements Committee has reported that £2,700 will be required during the ensuing year for coal, and £5,000 for electricity—a total of £7,700 against the Corporation provision of £6,000.

Eccles.—The Watch Committee has asked the Town Clerk and the borough electrical engineer to report on the suggestion by H.M. Inspector of Factories respecting the desirability of electric wiring and fittings, installed in factories by private electricians, being inspected and approved by the borough electrical engineer or other responsible official.

Edinburgh,--YEAR'S ESTIMATES .- The estimated expenditure by the Corporation lighting department for the ensuing year is £39,745, a decrease of £3,595 as compared with the net expenditure last year. The decrease is due mainly to the expected saving in respect of the restricted lighting of the city streets the sums estimated with respect to electric and gas lamps being in

each case £1,440 less than last year.

It was reported to the Electric Lighting Committee of the Corporation that the draft provisional estimates for the coming year showed a deficit of over £5,000. This was more than accounted for by the increased coal bill, which had gone up by £10,000. The Committee at its next meeting will consider whether the estimated deficit is to be made up by increasing the charges or otherwise.

According to a Glasgow paper, the Electric Lighting Committee has received inquiries as to the cost of energy for charging electric vehicles, and has decided to recommend that the charge be 1d. ner unit, as the accumulators would be charged during night. ကြသော .470M_8

Erith.—Bulk Supply, &c.—The West Kent Electric Co. has applied to the U.D.C. for terms for a bulk supply of current for lighting 200 cottages to be erected in Colyer's Lane. The Council has referred the matter to the chairman, clerk, and engineer to take such steps as they may deem necessary. The engineer having reported that the question of extending the generating plant was becoming a matter of some urgency, has been instructed to submit a report, including a comparative statement showing the consumption by power consumers during the past four or five years, and his observations in connection with the probability of bulk supplies in the district.

Haslingden.—Loan Sanction.—The L.G.B. sanctioned the borrowing of £4,600 for mains and special trench work, and £2,770 for services, switchgear and transformers

Heywood.-Increased Prices.-An advance of 10 per cent. in charges for electricity came into operation last week, the increase being necessary in consequence of the high price of

Ilford. — ELECTRIC COAL WAGON. — The electrical engineer in a report favours the purchase of an electric vehicle for the cartage of ocal, but before making a recommendation on the subject, the Lighting Committee has arranged for an inspection. The Committee has adjourned consideration of certain new tariffs. The department's showroom in High Road has been closed, and since department's and supplies for inscription. since adapted for use as a sub-office for inquiries.

Keighley.—At a meeting of the T.C. last week, reference was made to the economies being adopted with regard to expenditure on municipal undertakings. In regard to the electricity department it was stated that threequarters of the consumers on the mains were engaged on Government work, and owing to this fact and the constantly increasing demands upon the supply, the month of March showed an increase in revenue of £500, as compared with the corresponding period of 1914.

Kingston-on-Thames. — INCREASED PRICES. - The town clerk reports that in view of the recent decision of the Council not to accept a recommendation of the Lighting Committee that no alteration should be made in the rate of charge for that no attention should be made in the rate of charge for current supplied for heating, cooking and fixed motors, the rate for such purposes would now be 13 3.0 per unit. The L.G.B. has requested to be furnished with particulars of the excess expenditure amounting to £5,792 on loans already sanotioned for purposes of electric lighting.

Kingstown.—The electrical engineer, Mr. J. P. Tierney, has been directed by the Council to submit alternative schemes for a generating station in connection with the electricity supply scheme.

London.—BERMONDSEY.—The Electricity Committee, on the report of the engineer, recommends that the stokers of the three Howden boilers at the electricity works be replaced by chaingrate stokers, and that the offer of Messrs. Bennis & Co. for the supply of such grates be accepted. The engineer considers that with the increased boiler power the question of obtaining a bulk

supply can be postponed for another year.

L.C.C.—The Finance Committee recommends that the Council sanction the borrowing by the Battersea B.C. of £9,000 for the electricity undertaking, viz, £6,050 for mains, £1,176 for house services, and £1,774 for meters; also £15,000 for electricity mains

by the Stepney B.C.

Sanction is also recommended to the borrowing by the Woolwich B.C. of £35,000, being £9,000 for buildings and £26,000 for electrical plant, providing the B.C. agrees that the balance remaining at April 1st, 1920, in respect of loans originally granted for 42 years for the old plant, should be repaid in half the period unexpired at that date.

The London Education Committee proposes to install electric power at the Aristotle Road (Clapham) metal work centre for

power at the Aristotle Road (Clapham) metal work centre for driving the machinery.

The Holborn B.C. Works Committee has decided in connection with the reduced street lighting that no further steps can be taken to modify the street lighting charges by the Metropolitan E.S. Co., which has expressed its disinclination, for certain reasons, to interfere with the terms of the contract, which is a 10 years' one.

Malvern.—INCREASED PRICES.—In view of the increased cost of production, the U.D.C. has advanced the price of current by 1d. per unit.

Manchester.—Increased Prices.—Ordinary consumers of electricity, as distinct from large consumers whose payments for current are regulated by a sliding scale, are to be charged an increase of 10 per cent, for light, and users of power an increase of 15 per cent. Consumers who are under the Norwich system and of 15 per cent. Consumers who are under the Norwich system and are charged 12½ per cent, on the assessable value of their houses, with the price of the unit in addition, will pay 15 per cent, in future. It will be remembered that a hint was dropped recently that increased charges would be necessary owing to the increased cost of coal and labour.

Merthyr Tydfil.—The Electric Traction and Lighting Co., Ltd., has applied to the B. of T. for consent to the use of overhead lines in the district for the transmission of energy at a pressure of 11,000 volts.

Mirfield,-Increased Prices.-Owing to the increased cost, the U.D.C. has advanced the price of energy for power and street lighting by 10 per cent.

Nelson.—Year's Working.—The electricity department has made a net profit during the past year of £1,138, as against an estimated profit of £1,420. In view of the circumstances, the result is regarded as most gratifying, and constitutes a record for the department, excepting only the returns for 1913-14.

Northampton. — Proposed POWER STATION. Northampton Electric Light and Power Co., Ltd., has made an application to the B. of T. for consent to the construction of a generating station at Far Cotton, one of the growing suburbs of the town. The site is on the river and near two railways. The disadvantage of the present station is that it is in such a position that a railway siding capacity be constructed. that a railway siding cannot be constructed.

Nuneaton.—RATE RELIEF.—The T.C. has decided to contribute £500 out of the past year's profits on the electricity undertaking towards relief of rates.

Rugby.—The U.D.C. has sanctioned the laying of E.L. cable in new streets off the Lodge Estate, at an estimated cost of £300.

Salford.—Proposed Loans.—The Electricity Committee has directed application to be made to the L.G.B. for a further sanction to borrow £5,466 to cover capital expenditure incurred in connection with the undertaking since March 12th last, in respect of loans sanctioned by the Board prior to that date.

Southampton.—The price for charging electric vehicle batteries has been fixed at 11d per unit. It has become necessary to increase the mains in the northern district at a cost of approximately £500, and the purchase of the necessary cable has been left in the hands of the engineer and chairman of the Electricity Committee.

Stoke-on-Trent.-INCREASED PRICES.-An advance of 10 per cent, in the charges for current has been made by the T.C.

Waterford,—L.G.B. Inquiry.—An inquiry into an application by the Corporation for a loan of £30,000 for the purpose of carrying out the electric lighting project, was held at the City Hall last week.—Freeman's Journal.

-At the last meeting of the Guiseley District Wharfedale.-Council, in view of the withdrawal of the Yorkshire Electric Power Bill, it was suggested that the time was now opportune to make some arrangements for the supply of electricity from a municipality at present owning electricity works, or a privately-owned power company, or for the combined District Councils to manufacture current themselves. It was agreed that the Guiseley Council should convene a conference of adjacent District Councils to ascertain the position occupied by them with respect to any lighting order that might be in existence.

## TRAMWAY and RAILWAY NOTES.

Blackburn.—YEAR'S WORKING.—In the tramways department the surplus profit for the year just closed is £1,572, against £4,011 in the previous year. Traffic revenue amounted to £65,158, a decrease of £3,034. Excluding Accrington borough, the mileage was 1,121,769, or 27,693 miles fewer than in the previous year, and the mileage run in Accrington was 65,014. The passengers carried numbered 12,223,569, against 12,731,532 in the previous year.

Bournemouth.—YEAR'S WORKING.—The annual report fournemouth.—IEARS WORKING.—The annual report of the Corporation tramways shows a net profit for the year of £9,350. The total traffic receipts for the year ended March 31st were £102.346; being a decrease of £2,623 on the previous year. Up to the declaration of war in August, the receipts were above the average, and a profit of £20,000 was fully anticipated. The year's net profit would have been much larger but for the fact that from August to March 31st £2,352 was paid as contributions towards the members of the staff who joined the forces.—Daily Telegraph.

Bury.—CARRIAGE OF GOODS.—At the recent meeting of the Associated Chambers of Commerce a resolution was brought the Associated Chambers of Commerce a resolution was brought forward by the Bury Chamber expressing the view that considerable commercial advantage would accrue through the ultisation of municipal tramways for the carriage of goods, and recommending individual chambers to further their use. It is now announced that the Bury tramways manager has favourably considered the proposal, and is prepared to give information to persons wishing to use the tramways in the way suggested.

Chester.—Tramway Traffics.—For the year ended March 25th there was an increase in the receipts from the fram-ways of £111, the increase in the number of passengers being 58,045.

The Tramways Committee has decided that no more men of serviceable age shall be engaged as conductors unless it be proved that they have been rejected or incapacitated for service in H.M. Forces.

For the time being, at any rate, the Tramways Committee has decided not to appoint women as tram conductors.

Colne.—YEAR'S WORKING.—The total revenue of the tramways for the year just ended amounted to £13,188, or 10°6d. per car-mile. The receipts amounted to £13,082, a decrease of £1,606, compared with the previous year; the passengers carried numbered 2,363,113, and the cars ran 296,021 miles. The greater portion of the decrease in receipts is attributed to the war.

Dundee.—At a meeting of the Corporation Tramway Committee it was stated that the revenue would be £1,500 less than last year, and that, due to the war bonus and payments to the dependents and enlieted men, the expenditure would be increased by that amount.

Digitized by Google

Eccles.—The T.C. has entered into an arrangement with £800, will repair the whole of the tramway overhead electrical equipment in the borough, and for a payment of £35 per mile of single trolley wire per annum, in addition to cost of new material provided, less value of scrap received, maintain the overhead equipment for a period of 10 years from April 1st, 1915.

Haslingden.--YEAR'S WORKING.—The traffic receipts of the tramways during the year ended March 31st amounted to £7,965, compared with £8,489 for the previous year, a decrease of £524. The mileage run was reduced by 5,625 miles.

The chairman and vice-chairman of the Tramways Committee

are to consider and report upon the purchase of a new motor tower

wagon or a vehicle suitable for conversion.

-WAR BONUSES.-The General Purposes Committee, on Monday, considered an application from members of the Tramwaymen's Union in the service of the Corporation for an increase of war bonuses now being paid under the Corporation scheme. The Committee declined to accede to the request, and took the view that the present scale of allowances is adequate.

London (L.C.C.) .- According to the Evening News, dissatisfaction is reported amongst the men working on the L.C.C. tramways, and a mass meeting is being called for May 15th. The wages agreement under which the men are working expires on June 26th. Very few of the drivers and conductors benefit from the war bonus given to L.C.C. employés earning less than 30s. a

Nelson.—YEAR'S WORKING.—During the past year the net profit yielded by the light railways was £314, as against an estimated profit of £828. In his annual report, Mr. Naylor (manager) states that, in view of the outlook, the proposed venture with regard to railless traction has been left in abeyance.

-FEMALE LABOUR.—The Tramways Committee Salford. has decided to employ 16 women as car conductors as an experi-ment. They will work six hours a day, and will be paid the standard rate of wages. Women washers are to be employed for day work at the depô's, so as to liberate men for night work. The local branch of the Tramway Workers' Union has adopted a

resolution to the effect that the members will not entertain the question of female labour in Salford, and that they will refuse to work with women. The matter was to be considered on Tuesday at a meeting of the Tramways Committee.

# TELEGRAPH and TELEPHONE NOTES.

Austro-Spanish Wireless.—Since March 22nd a radiotelegraphic service has been established between the Austrian wireless station at Trieste and the Spanish station at Barcelona. The tariff is 29 centimes per word.

The Minister of the Interior has prepared an instruction on the order for levying a single tax on telephones in Russia, except on such apparatus as have been installed for free use, and also excepting Finland. The tax amounts to 10 roubles for each apparatus. For supplementary apparatus, no matter how many, the same rate must be paid. In case of transfer of apparatus the most recent user becomes responsible for the tax.

Spain.—The Spanish National Submarine Telegraph Co., owing to the expiration of its concessions for submarine cables, is in liquidation.—Journal Télégraphique.

Wireless Telegraphy.—It is reported from New York that plans are being prepared by experts of the U.S. Navy Department for the establishment of a wireless telegraph station at Cape ment for the establishment of a wireless telegraph station at Cape Cod, which will be equipped with an apparatus specially designed to give assistance to ships groping their way up and down the Atlantic during dense fogs. The apparatus, although of foreign origin, has been perfected by an American naval officer in such a way that it will, it is claimed, be possible to locate a calling ship by the measurement of the radio waves and the assistance of a

compass.

The Australian Government is making arrangements to equip the trans-Continental railway works with four wireless plants, so as to enable the working parties to keep in touch with each other, and thus avoid delays. The sets have been designed by the Commonwealth engineer for radiotelegraphy (Mr. Balsillie). Each will have a range of about 150 miles, but will rarely be required to work over more than 20 to 30 miles.—T. and T. Age.

Telephony.—Some time ago the Japanese Wireless Department of Communications established a system of wireless telephonic communication between Tobs, in the Province of Shima, and the Island of Ishijima. The service having proved extremely useful to shipping, it is reported that the Department has decided to establish wireless telephone stations at five other ports, the range of communication in each case being between 40 and 50

# CONTRACTS OPEN and CLOSED.

#### OPEN.

Argentina. - For the first section of the National College at Salta (cost £34,300) an electrical installation and telephones will be required, and public tenders are to be invited by the Direction General for carrying out the works.

Australia.—Melbourne.—May 18th. Four 250-k.v.A. three-phase transformers; 9,680 yards '05 sq. in., three-core, lead-covered cable, for the City Council. See "Official Notices" April 30th.

April 30th.

May 19th. Victorian Railways. Meters, coasting recorders or other energy-checking devices for train operation on the multiple-unit system, D.C., 1,500 volts. See "Official Notices" April 30th.

June 15th. City Council. Four mechanically-fired boilers, one turbine-driven boiler-feed pump, two fuel economisers, circulating water pumps. City Electrical Engineer. Specifications from Messrs. McIlwraith, McEacharn & Co., Ltd., London, E.C.

Synthy w. Lang. 16th. Deputy P. M.G. 1000 Morres counders.

Sydney.—June 16th, Deputy P.M.G. 400 Morse sounders, American pony pattern. (Schedule No. 449.)*

July 19th, Municipal Council. One or two 12,000-kw. turboalternators (Contract No. 363).* A copy of the specification can be obtained from the City Electrical Engineer, Sydney.

July 19th, Steel towers for 33,000-volt transmission line. Specification (10s. 6d.) at E.L. Department, Town Hall.

TOOWOOMBA.—June 7th. 480-volt DC. electrically-driven centrifugal well-sinking pump, 30,000 gallons per hour, against a head of 200 ft. max. Deposit 2½ per cent. City Engineer.

Specifications for the items marked * can be seen at the B. of T. Commercial Intelligence Branch in London.

China.—Shanghai.—May 20th. 2,600 yards of threecore E.H.T. armoured cable, and 79 three-phase induction motors, for the Municipal Council. See "Official Notices" to-day.

Darlington.—May 20th. Corporation. Cast-iron condenser water pipes. See "Official Notices" to-day.

Dover.—May 18th. Six electric vehicles, for the T.C. See 'Official Notices' to-day.

Finchley.—May 31st. U.D.C. Wiring, for light, 100 workmen's dwellings. See "Official Notices" to day.

France.—The Administration des Chemin's de fer de France.—The Administration des Chemins de fer de l'Etat, Paris, wants 46 A.C. motors of 10, 15 and 20 km., for the new workshops of Sotteville; particulars from the Bureaux du Service Electrique (1re division), 43, Rue de Rome, on Tuesdays and Fridays, 3 to 5 p.m., up to May 14th. The Administration also wants motor-compressors for railway automobiles; particulars from the Bureaux du Service Electrique (3° division), 72, Rue de Rome, between the same hours, up to May 17th.—La Lumière Electrique.

Leeds. — May 26th. Corporation. Steam, feed and water pipes. See "Official Notices" to-day.

Leigh (Lancs.).—May 21st. One vertical tube boiler. one 250-kw. rotary converter or motor converter, one switch panel, for the Borough Electricity Committee. See "Official Notices" April 30th.

London.-May 12th. L.C.C. Installation, about 210 wiring and 250 lighting points, at Sebbon Street Elementary School, Islington, N. See "Official Notices" April 30th. The Highways Committee recommends that tenders be invited from selected firms for the supply of foundry plant for the central

car-repair derôt.

Manchester.—June 2nd. Corporation. Coal-unloading crane, conveying plants, &c. See "Official Notices" to-day.

Norwich.—May 11th. 5,000 tons of coal, peas or slack, for the Electricity Department. Forms of tender from Mr. F. C. M. Long, City Electrical Engineer.

Sheffield.—May 28th. Two natural draught cooling wers complete. For the Electric Supply Department. See towers complete. For to Official Notices" to-day.

South Africa. - Johannesburg. - June 1st. Municipal 24 double-pole, automatic, oil-immersed circuit breakers of a continuous carrying capacity of 200 amperes (Contract No. 971). Specifications, &c., from the Controller of Stores, Municipal Offices, Plein Square, Johannesburg. Tenders to Town Clerk.—Board of Trade Journal.

Spain.—May 18th. Plant and material for a hydroelectric station in connection with the Principe Alfonso drainage works, Province of Palencia. Tenders, description and deposit (£41) to Negociado de Aguas del Ministerio de Fomento, Madrid. Local representation.

June (end). Director-General de Correas y Telégrafos, Calle de Carretas 10, Madrid. Laying a submarine cable from Cadiz to Laraiche, and repair of certain cables. Further particulars at Board of Trade Commercial Intelligence Branch in London.

Sub-station Tasmania. - Launceston. - July 26th. equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

Winchester.—May 11th. Corporation. Twelve months' supply of steam coal, for the Electricity Department. See "Official Notices" April 30th.

#### CLOSED.

Brighton.—The T.C. has accepted the tender of Richardsons, Westgarth & Co., Ltd., for a surface condenser for the Southwick power station, at £1,925.

Condensing Plant Contracts.—The Mirrlees Watson Co. has recently received orders for condensing plant as follows:

Torquay Corporation.—Third set.
South Leicesterahire Colliery Co.—Two sets.
Millom & Askam Hematite Co., Ltd., per Messrs. Fraser & Chalmers.—
Fifth set.
Compagnie Francaise Thomson Houston, Paris, for Tulliere power
station.—Fourth set; also for Athens power station.—Third set.
Tharsis Sulphur and Copper Co., Ltd.—Three sets.
Also plant for Bourges (France), Senegal, Russia, Japan, Straits Settlements and West Indies.

Derby.—The T.C. has accepted a tender from Messrs. Edgar Allen & Co., Ltd., for tramway rails.

Grimsby.—The T.C. Lighting Committee has directed that half the quantity of meters required for a period of two years be purchased from the British Thomson-Houston Co., and the remainder from Mesers. Chamberlain & Hookham, and Mesers. Ferranti, Ltd., in equal quantities.

Halifax.—The Tramways Committee has accepted the tender of the General Electric Co., Ltd., at £2,563, for three rotary converters, transformers, and switchgear required in connection with conversion of the Hipperholme and Hebden Bridge sub-stations plant to three-phase 50-cycle alternating current supply.

Hendon.—The tender of the Hendon Electric Supply Co., at £198, has been accepted by the Education Committee for wiring the Wessex Garden School. Four tenders were received. A similar number of tenders were also received for wiring the Bell Lane School; consideration of these has been deferred.

Liverpool,—The City Council is recommended to accept the tender of Messrs. Ferranti, Ltd., for a 12 months' supply of electric meters.

London.—HAMMERSMITH.—The Electricity Committee reports that Messre. Johnson & Phillips, Ltd., the contractors for reports that Mesers. Johnson & Phillips, Ltd., the contractors for the supply of box frames, covers, boxes, &c., during the current financial year have written stating that since the acceptance of their tender they have received a number of Government orders, and that in consequence of a considerable number of men being specially allocated for Government work, the deliveries of the Council's order would be impeded. Under the circumstances the firm ask to be allowed to withdraw the tender. The Committee recommends the Council to agree with the request, and has directed the engineer to communicate with Mesers. W. Lucy & Co., Ltd., the next lowest tenderers, to accertain if they are prepared to enter into a contract with the Council. into a contract with the Council.

SHOREDITCH.—The Lighting Committee has accepted the tender of the Stirling Boiler Co. to supply and fix one pair of chain grate stokers for £415, including 250 spare links of the double lap type.

The following tenders have been received by the London Education Committee for installing electric lighting in the Darinton Road School, Wandsworth:—

Alpha Manufacturing	Co.	•	• •	• •	(a	ccept	eđ)	<b>£</b> 858
Johnson. O'dullivan &			• •	• •	• •			894
Napier, Kimber, Ltd				• •				414
and Bros. & Co			• •					428
C. H. Catheart & Co								585
M. Mackie & Co.					• •			587
Holland & Sons			• •		• •			804

BERMONDSEY.—The Electricity Committee has recommended the acceptance of the tenders of Messrs. Hy. Clark & Sons, Ltd., W. B. Dick & Co., Ltd., and the Silvertown Lubricants, Ltd., for engine oils during the ensuing 12 months.

L.C.C.—The Asylums and Mental Deficiency Committee has accepted the tender of Messrs. Tyler & Freeman, at £271, for installation of telephones, fire alarms and call-bells at the Maudsley Hospital.

Manchester.—The Electricity Committee has accepted the following tenders :-

Three three-wire balancers.—Lancashire Dynamo & Motor Co., Ltd., Cable.—B.I. & Helsby Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Johnson & Philips, Ltd.; Western Electric Co., Ltd.; Union Cable Co., Ltd.; W. T. Glover & Co.
Three 1,250-K.V.a. static transformers.—British Westinghouse Co. One 250-K.V.a. transformer.—British Electric Transformer Co., Ltd.
Three 1,000 K.V.a. three-phase static transformers.—Ferranti, Ltd.
One 650-KW. rotary converter.—British Westinghouse Co.
High-pressure steam valves.—Dewrance & Co. and J. Hopkinson & Co., Ltd.

The Corporation Sanitary Committee has accepted the tender of Messrs. Waygood Otis, Ltd., for repairs to the lift at the Civio Buildings.

The following tenders have been accepted by the Tramways Committee:

Furnace coal.-Kelsall Bros., and J. Smith & Co.

Block tin.—John Mackie & Sons (agents for Cornish Tin Smelting Co , Ltd.).

Fishplates.—Bolokow, Vaughan & Co., Ltd.

The resolution of the Tramways Committee accepting the tender of Messrs. John Brown & Co., Ltd., for a portion of the Committee's requirements of steel car tires has been resoluted, and an amended tender of Messrs. Cammell, Laird & Co., Ltd., for the whole of the Committee's requirements of such tires has been accepted.

Meter Contracts.--Messrs. Chamberlain & Hookham, have received the following contracts for meters for 12 months:

Maidenhead.—p.c. meters. South Shields.—a.c. meters. Bradford.—a.c. aud p.c. meters.

Mesars. Ferranti, Ltd., have received the following contracts. all cases they are for the year ending March, 1916, excepting Alloa and Bradford, and these run to May, 1916:—

d Bradford, and these run to may, 1916;—
Belfast Corporation.—c.c. house service meters, 250/500-ampere sizes only.
Halifax Corporation.—c.c. house service meters.
Heston and Isleworth U.D.C.—c.c. house service meters.
Swindon Corporation.—c.c. house service meters.
Wimbledon Corporation.—A.c. house service meters.
Grays U.D.C.—c.c. house service meters.
Grimsby Corporation.—Portion c.c. house service meters.
Birkenhead Corporation.—c.c. house service meters.
Alloa T.C.—c.c. house service meters, 10-100 amperes inclusive,
Liverpool Corporation.—c.c. house service meters.
Borough of Kilmarnock.—c.c. house service meters.
Bradford Corporation.—C.c. and A.c. house service meters.

Nuneaton. — The T.C. has sealed a contract with Callender's Cable and Construction Co., Ltd., for the supply of cable.

Preston.—The Electrical Apparatus Co., Ltd., has obtained a renewal of the present contract from the National Electric Supply Co. for the sole supply of motor starters for a further period of 12 months.

Southampton.—The following tenders have been received for the supply of steel tramoar tires :-

J. Baker & Co.
J. Brown & Co., Ltd...
Cammell, Laird & Co.

The acceptance of a tender has been left with the manager and chairman of the Tramways Committee.

#### FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, May 7th. At 8 p.m. At 89, Viotoria Street, S.W. Informal discussion.

Victoria Birees, S.W. Informal discussion.

Association of Mining Electrical Engineers (Notts. and Derbyshire Branch).—Joint Meeting with National Association of Coliery Mausgers. Baturday, May 8th. At 8.80 p.m. At University College, Nottingham Paper on "Protective Devices," by Messra. E. Kilburn scott and L. F. Fogarty.

Institute of Metals.—Wednesday, May 12th. At 8.80 p.m. At Institution of Electrical Engineers, Victoria Embankment, W.C. Paper on "The Passage of Electricity through Metals," by Sir J. J. Thomson, F.R.S.

Institution of Electrical Engineers (Birmingham Local Section).—Wednesday, May 12th. At 7.80 p.m. At the University, Edmund Birect. Annual General Meeting.

(Yorkshire Local Section).—Wednesday, May 12th. At 7 p.m. At Philosophical Hail, Leeds. Annual General Meeting. Paper on "The Power Supply of the Central Mining—Rand Mines Group," by Mr. J. H. Rider.

Royal Society of Arts.—Wednesday, May 12th. At 8 p.m. At John Street.

Royal Society of Arts.—Wednesday, May 12th. At 8 p.m. At John Street, Adelphi, w.C. Paper on "Recent Progress in Pyrometry," by Mr. C. R. Darling.

Darling.
Institution of Mechanical Engineers.—Friday, May 14th. At 8 pm. At Institution of Civil Engineers, Great George Street, Westminster. Paper on "The Distribution of Heat in the Cylinder of a Gae Engine," by Prof. A. H. Gibson and Mr. W. J. Walker.

Royal Institution of Great Britain.—Saturday, May 15th. At 8 p.m. At Albemarie Street, W. Lecture on "Advances in the Study of Radio-Active Bodies," by Prof. F. Boddy.

Generous Gift to Leigh Infirmary.—In memory of his father, the late Alderman Thos. Greenough, Mr. Thos. R. Greenough, on behalf of his mother and himself, on Thursday last week handed over to the Leigh Infirmary a complete electrical and radiographical department in three divisions, at a cost of about £5,000.

Fatalities .- STIRLING .- William McClumpha, electrical engineer, who resided at Millhall Cottages, near Stirling, was killed instantaneously in No. 1 Pit, Polmaise Colliery. He was repairing a coal-cutting machine, when it was accidentally set in

MANCHESTER.—At Manchester on Monday an inquest was held on William Dyson, aged 57. It appeared from the evidence that on April 16th the deceased, who was employed by the Calico Printers' Association, was instructed to repair an electric bell in connection with the hoist at the Oxford Street premises of the firm. He had to get to the top of the lift, and while he was carrying out the work his arm caught one of the control wheels, and the lift was set in motion. It ascended to the top and jammed Dyson's leg, the injury subsequently proving fatal. "Accidental death" was the verdict.

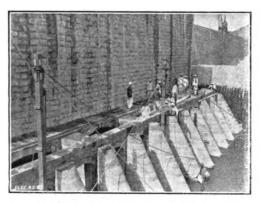

# THE BOMBAY HYDRO-ELECTRIC SCHEME.

## By A. DICKINSON, M.I.E E.

Ir is proposed in this paper to give particulars of a large hydro-electric scheme known as the Tata Hydro-Electric Power Supply Co., Ltd., Bombay. The main object of this

situated at Khopoli, 43 miles from the receiving station on the Island of Bombay. (See map on p. 661.)

The present scheme is to install in the power house eight

-DAM AND SLUICES.

NATIVES PREPARING FOUNDATIONS OF DAM.

Fig. 3.—Dam under Construction.

company is to supply electrical energy for use in Bombay, principally for power in cotton mills.

The hydraulic section of the scheme is exceptional, inasmuch

as special lakes have been created, and the whole of the

sets, each 11,000 B.H.P., and in the receiving station the plant necessary to deal with the power-house output. Five sets only are now installed in the power house, and the remaining three sets will be put down as water becomes available.

-DUCT IN DEEP CUTTING.

Fig. 5.—Duct in Tunnel.

FIG. 6.—DUCT ON HILLSIDE.

water for supplying the power is collected from the rain falling during the monsoon. Three reservoirs are being formed by constructing dams across valleys known as Lonawla,

Generation is at 5,000 volts, 3-phase, 50 periods, the energy being transformed up to a line pressure of 100,000 volts. Lonawla is a storage lake intended principally for use during

the monsoon period, and, when this lake is empty, water is drawn from the lakes of Walwhan and Shirawta.

The lakes are formed by constructing across the three valleys dams with coursed rubble masonry faces and with heart of

PIPE-LINE UNDER Construction.

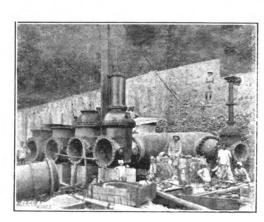

Fig. 8.—Valves on Pipe-line.

FIG. 9.—FOREBAY UNDER CONSTRUCTION.

Walwhan, and Shirawta. From the reservoirs the water is conveyed in an open duct to the forebay, and thence through pipe lines to the power house, a distance of 13,000 ft., in which length there is a fall of 1,725 ft. The power house is

*Abstract of paper read before the Institution of Electrical Engineers, April, 1915. A preliminary description appeared in the Electrical Review of January 16th, 1914, p. 93. For the accompanying views (reproduced from lantern slides) we are indebted to the courtesy of the Author.—Eds.

uncoursed rubble masonry. Height of dams in feet. Name of lake. Lonawla ... 19 5,500 Walwhan... 4.500

986 361 1 535 2 560 6,963 3.174 Digitized by Google Two dams form Lonawla Lake, a main dam 3,600 ft. long across the valley and a smaller dam in which the sluices are built, 1,900 ft. long, the former being about 40 ft. high to the bottom of the foundation and 26 ft. above the lowest level of the valley, across the head waters of the Indrayani River.

Fig. 10.—One of the Dams approaching completion; Lake partly filled.

Walwhan dam is 4,500 ft. long and 75 ft. high to the bottom the foundations, and 68 ft. above the lowest level of the

Shirawta dam is 8,000 ft. long and 100 ft. high to the bottom of the foundations, and 92 ft. above the lowest level of the

The total quantity of rubble masonry in the three dams is 26,000 cubic yards. The outlet of Shirawta Lake is con-926,000 cubic yards.

The inlets are protected by screens so constructed that one screen slides over the other, the object being to free the screens from grass or other debris collected thereon.

From the forebay the pipe line, which is one of the largest (as regards the horse-power transmitted) ever built for a water-power plant, conveys the water down the cliffs and steep slopes to the power house at Khopoli in the plains below. The scheme has been designed in two sections, two upper and eight lower pipe lines. The present installation (half the scheme) comprises one upper pipe line, a distributing pipe, and four lower pipe lines, the total length being about 13,000 ft., 8,200 ft. of upper and 4,800 ft. of lower pipe line.

The upper pipe line is built in three sections, decreasing from 82½ in. diameter and ½ in. thick to 72 in. diameter and 13/16 in. thick. The distributing pipe is 72 in. in internal diameter, 15/16 in. thick, and about 46 ft. long, with four 42-in. branches and one spare branch. The lower pipe line, starting from the distributing pipe, is of lap-welded steel tube 42 in, to 38 in. in internal diameter and ½ to 1½-in. thick. Near the power house, three exciter-turbine pipe-line connections are provided. The pipe lines are designed for a factor of safety of 4.5, calculated on the minimum tensile strengths and static heads.

The whole pipe line is laid above ground, provision being and static heads.

The whole pipe line is laid above ground, provision being made for variations of temperature from 50° F. to 127° F. by expansion joints.

The waste-weir level at the forebay is 2,032 ft. and the power house floor level 309 ft. above the mean sea-level, giving a static head of 1,725 ft. to the centre of the turbine gate, with a pipe pressure of 743 lb. per square inch. With four turbines, each running at 11,000 B.H.P., the total loss of head in 66 ft. is 66 ft

The scheme has been designed for a normal plant capacity

of 88,000 H.P. in eight main 11,000-H.P. sets, two 850-H.P. exciter sets, and eight step-up 3-phase 10,000 K.V.A. transformer banks, with the necessary switchgear, station auxiliary apparatus,

switchgear, station auxiliary apparatus, and four outgoing lines.

The present building will take five main and two exciter sets, five transformer banks, switchgear, and auxiliaries, and two outgoing lines. The building consists of a turbine and generator room spanned by a 67-ton electric travelling crane, 5,000-volt busbar and oil-switch rooms, transformer compartments with a tramway passage compartments with a tramway passage and turntable for handling the transformers by means of trucks, and a repair shop, all these being on the ground floor, together with a 100,000-volt bus-bar and oil-switch room and transmission-line outlet tower located

on the floors above.

The main sets consist of Escher-Wyss hydraulic impulse turbines of the horizontal type running at 300 revs. per minute and direct-coupled to Siemens Brothers three-phase generators. The exciter sets consist of Escher-Wyss tangential wheels, running at 600 revs. per minute

Figs. 11 and 12.—Exterior of Power House, Khopoli.

nected to Walwhan Lake by a tunnel 5,000 ft. long through the hills, the formation being hard trap rock. At the inlet of this tunnel there is a head wall containing ample sluices to allow Shirawta Lake to be discharged into Walwhan Lake as desired to meet the required conditions of draw off.

The ducts have a water capacity of 120,000 H.P., the maximum

of 120,000 H.P., the maximum velocity of the water being approximately 5 ft. per second.

The country through which the ducts pass is very difficult, necessitating the construction of 22 aqueducts. There are three tunnels cut through rock, one being 750 ft. in length, one 280 ft., and another 130 ft., making in all a length of 1,160 ft. In addition there are 10 cut and cover tunnels length of 1,160 ft. In addition there are 10 cut and cover tunnels having a combined length of 2,630 ft.

The forebay has a storage capacity of 1½ hours with the whole of the eight sets working. Openings are proved in the dam for three 82-in. pipes.

The gates are operated by racks, ither by hand or by an electric motor of 12 H.P. at 600 R.P.M. This gives to the gates a lifting speed of about 13½ inches per minute, so that fully to open the gates takes about 8 minutes.

Special provision has been made

Special provision has been made for speedily closing the gates from the power house in case of a burst pipe, or due to any other neces-sity. This is accomplished by a solenoid releasing the ratchet wheels so that the gates close by

wheels so that the gates close by their own weight. On the gates is a device which automatically disconnects the electric motor before the gates reach the highest or the lowest positions. The gates are also fitted with automatic brakes so that when operating the gates from the power house they cannot be damaged by falling too quickly.

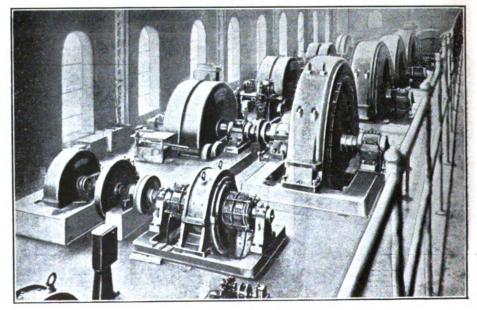

Fig. 13.—Generating Plant and Exciter in Power House.

and direct-coupled to Siemens Brothers compound-wound generators.

The turbine wheels consist of cast-steel disks and buckets carried by Siemens-Martin steel shafts, with two ring-lubri-

cating bearings provided with water cooling. The nozzles are of the cast-steel deflecting type, and the governors are of the oil-pressure type fitted with hydraulic automatic servomotors, guaranteed to limit the speed variation to 2½, 5, and 12 per cent. when 25, 50, and 100 per cent. of the load is suddenly thrown off. A dash-pot connects the deflecting nozzle and

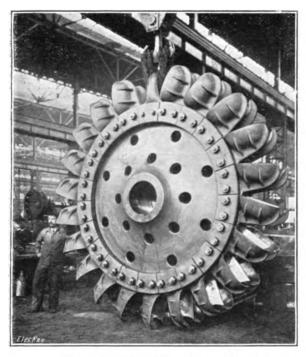

Fig. 14.—Pelton Wheel of 11,000 b.H.P.

the automatic speed governor, only the needle being connected

the automatic speed governor, only the needle being connected rigidly to the governor.

In the event of a sudden closing movement, the servomotor diverts the jet from the runner-wheel, the levers being so arranged that during this operation there is no movement of the needle to close the nozzle, thus guarding against an increase of pressure in the pipe line. The nozzle then begins to return to its normal position, the needle at the same time decreasing and closing the jet outlet. This movement is followed automatically by the action of the dash-pot, the piston slowly sinking and the deflecting nozzle being returned to its normal position. With a slow closing movement of the regulator the nozzle is not deflected, owing to the slow movement of the dash-pot piston, the needle being slowly operated ment of the dash-pot piston, the needle being slowly operated

directly from the regulator.

The exciter turbines have separately-fitted cast-steel buckets. with similar governors guaranteed to limit the speed to 3, 6,

and 16 per cent. when 25, 50 and 100 per cent. of the load is suddenly thrown off. The guaranteed full-load efficiency is 82 per cent. for the main, and 77 per cent. for the exciter turbines.

The main generators are of the rotating-field totally-enclosed type, designed for a normal load rating of 8,000 kw. at a power factor of 0.8 and 4,000 to 5,300 volts, 50 periods, 3-phase, with a temperature rise not exceeding 60° F, above air at 110° F., and 20 per cent. overload for 10 hours without injury. The full-load efficiency at 0.8 power factor is 94.3 per cent., with an inherent regulation of 9 per cent. at unity and 22 per cent. at 0.8 power factor. Induced ventilation is provided by means of fans on the rotor shafts, each machine being connected to

the main inlet air-duct by a shutter and to the outlet air-duct to the atmosphere. These shutters are motor-operated with automatic control, so arranged that when the field switches are closed the shutters are open, and vice versa. The bearings are supplied with oil under pressure and are provided with water cooling.

The exciters are compound-wound machines designed for a full-load rating of 600 kw. at 250 volts, and 20 per cent. over-load, the full-load efficiency being 93 per cent. The energy required for excitation at full-load and unity power factor is 25 kw. and at 0.8 power factor is 38 kw.

load output of 3,333 k.v.a. at 0.8 power factor when stepping up from 5,000 to 100,000 volts, 50 periods, the temperature rise not exceeding 70° F. above cooling water at 75° F., with a water circulation of 950 gallons per hour. These sets are capable of 20 per cent. overload for 10 hours with a water circulation of 1,200 gallons per hour without injurious heating. The full-load efficiency at 0.8 power factor is 98.1 per cent., and the efficiency at half load is 97.2 per cent. The regulation is 0.8 per cent. at unity power factor, and 4.6 per cent.

at 0.8 power factor.

The transformers are of the shell type, having flat primary and secondary coils placed vertically and surrounded by a laminated sheet-steel core, the design and arrangement being such that the heat is conveyed from the interior to the water-

cooling coils and tank by natural circulation.

The tanks are of boiler-plate steel, cylindrical in form, and are supported on a cast-iron base. The high-tension bushings

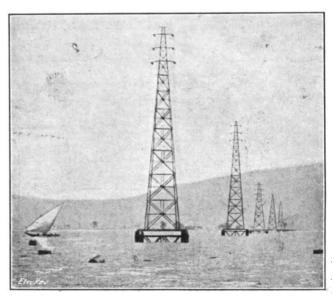

Fig. 17.—Transmission Line crossing Creek.

are of the compound-filled type, and consist of a conducter rod from the top to the bottom, which is surrounded by several concentric press-board insulating cylinders, separated by spaces, outside which the exterior wall of the bushing is built up of a number of annular rings of moulded insulating compound, interspaced with impregnated press-board disks of larger diameter than the rings in order to prevent leakage.

Digitized by Google

These disks and rings are cemented together and are tightly clamped by nuts at the top and bottom of the rod. ings are supported on cast-iron rings attached to the cover. The low-tension bushings are of porcelain.

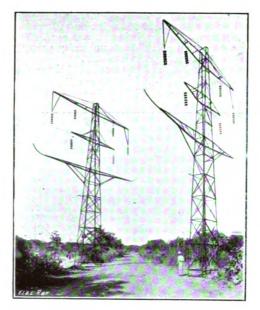

Fig. 18.—Road Crossing on 100,000-volt Line.

The principal dimensions of the transformers are as follows:—Height to the top of the high-tension lead 16 ft., and to the cover 13 ft.; diameter of the tank 8 ft. The weight

FIG. 19.—RECEIVING STATION AND LINE TERMINAL AT PAREL.

when assembled and filled with oil is 24 tons, of which the core and coils account for 11 tons. The quantity of oil required for filling is 2,300 gallons, and weighs 8 tons. The oil used is a specially-prepared mineral oil, treated before

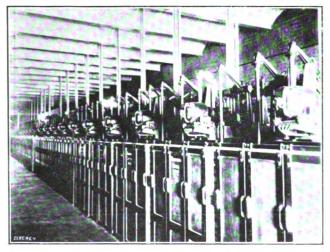

Fig. 20.—6,600-volt Feeder Oil Switches.

filling, and from time to time in service, in a drying and purifying outfit in order to remove moisture and foreign matter. This outfit consists of a portable set comprising a filter-press, a motor-driven centrifugal pump, and a strainer,

and is mounted on a truck. It is capable of treating 1.500 gallons of oil per hour, the filtering medium being blotting

paper.

Provision is made in the oil-pipe system for connecting this set to any transformer the oil of which requires treatment. The oil is tested in a standard testing set, consisting of an oil receptacle with a 0.2 in. spark-gap and contacts, and a testing transformer, and the oil is filtered until the puncture voltage is raised to 40,000 volts.

The water supply for the cooling coils is obtained from the pipe line through a reducing valve, a tank being provided

The water supply for the cooling coils is obtained from the pipe line through a reducing valve, a tank being provided for the system, whence the water is fed by gravity at an inlet head of about 20 ft. through the necessary piping and valves connecting up the three coils placed in the upper part of each tank, where they are constantly in contact with the heated oil rising from the windings and core.

Each bank of transformers on overload rating takes 3,600 gallons of water per hour at a temperature of 75° F., and the total requirements of the plant now being installed will be

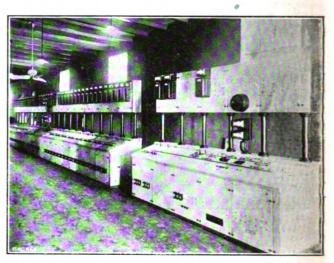

Fig. 21.—Bench Control Board at Receiving Station.

18,000 gallons of water per hour. Each inlet pipe is provided with a water-flow indicator and a discharge alarm.

Provision is made for operating each main unit with its own transformer bank, or through the 5.000-volt transfer busbar with any bank as required, and on the high-tension side the transformer banks and outgoing lines are operated in

equipment consists of remote-control. operated oil switches and other apparatus operated from the

Fig. 22.—Feeder Cables from Receiving Station.

benchboard located on a gallery overlooking the generator room. The apparatus in the generator circuits consists of three single-pole, non-automatic, solenoid-operated oil switches in cell compartments, disconnecting switches, and current and potential transformers; and in the high-tension side of the transformer banks three single-pole, automatic, solenoid-operated oil switches in tanks, disconnecting switches, and series relays; and similar equipments in the outgoing lines with the addition of current transformers, choke coils, and lightning-arrester equipment.

The high-tension oil switches are automatically tripped by inverse time-limit, overload, series relays which are mounted

on post insulators, a long rod from the relay closing a switch on the wall in the opening-coil circuits of the solenoids in the control wiring. Each switch unit is designed to operate as one switch with a breaking capacity of 40,000 K.V.A.

control wiring. Each switch unit is designed to operate as one switch with a breaking capacity of 40,000 K.V.A.

The transfer bus-bar system consists of a copper bar carried on insulators and sectionalised by means of disconnecting switches, and the high-tension bus-bar system of copper tubing which is carried on post insulators, suspended from the roof, sectionalised with disconnecting switches and provided with three single-pole, automatic, solenoid-operated oil switches in tanks between the fourth and fifth banks. This switch is tripped by means of inverse time-limit, overload relays in connection with current transformers.

The low-tension wiring consists of varnished cambric-insulated, fireproof-treated cables, and the high-tension copper tubing on post insulators is arranged for a phase-spacing of 5 ft. and a striking distance to earth of 3 ft., the circuits being taken through the roof of the transformer compartments in compound-filled bushings.

The switchgear equipment in the duplicate station transformer circuits from the transfer bus-bar consists of triple-pole automatic, motor-operated oil switches, instantaneous, overload series relays, and disconnecting switches.

The benchboard, which is capable of extension as required, is built of blue Vermont marble panels, mounted on pipe supports, with grille work at the back fitted with the necessary instruments, control switches, and indicating lamps, a mimic bus-bar system of remote-control apparatus for operating the generators and transformer banks, exciters, outgoing lines, station

bus-bar system of remote-control apparatus for operating the generators and transformer banks, exciters, outgoing lines, station transformers, a 200,000-volt testing transformer, and a water rheostat testing equipment. Calibrating and testing terminals are provided and also a swinging bracket carrying illuminated-dial voltmeters and a synchronism indicator. For signalling to the generator-room floor a complete signal system is installed, with a signal stand near each generator. each generator.

The control switches are of the "push and pull" button type, single-pole double-throw, a green pilot lamp indicating the open position of the oil-switches, and a red pilot lamp the closed position.

The system is operated at 220 volts from a 60-ampere 8-hour battery, or from the 18-kw. motor-generator charging set if required. From this supply are also operated the motors of the generator field-rheostats, air-duct shutters, and turbine

The auxiliary switchboard controls the supply from the two 312 K.v.a. 5,000/440-volt 50-period 3-phase transformers for station power and lighting. It is built of blue Vermont marble panels, carried on pipe supports. There are two transformer panels, six double feeder panels, a lighting panel, and a battery and motor-generator panel.

The bus-bars are of copper bar and are carried on insulators at the back of the board. The oil switches are of the triple-pole, automatic hand-operated type, and are fixed behind the board, the transformer circuits having current transformers and inverse time-limit overload relays, and the power circuits trip coils for automatic protection.

Voltage regulators are installed for maintaining a constant

voltage on the bus-bars.

The lighting supply is furnished from three 30-kw. 440/220-volt 50-period single-phase transformers.

Two Willans-Siemens Diesel sets installed in an adjacent building provide a stand-by supply through a "tie" feeder previded on the board. Each set consists of a 100-H.P. 200-R.P.M. engine direct-coupled to an 80-K.V.A. 440-volt 50-period 3-phase alternator.

The voltage on the high-tension bus-bars is automatically maintained between certain limits by means of a Tirrill or Brown-Boveri regulator operating from a 100,000/100-volt potential transformer.

potential transformer.

Each outgoing line is protected with choke coils and an aluminium-cell lightning-arrester equipment complete with horn gaps, disconnecting switches, a discharge alarm, and discharge recorders. The generators are star-wound for operation with an unearthed neutral, and for protection against pressure-rises are provided with "over-tension" apparatus, consisting of isolating switches, static dischargers, and stardelts horn-gap arresters delta horn-gap arresters.

delta horn-gap arresters.

The route of the transmission line is shown in fig. 23. It has a length of 43 miles from the power house at Khopoli to the receiving station on the Island of Bombay, and crosses two tidal creeks, one 10,000 ft. wide and 42 ft. deep at high tide, a railway, and several roadways. There will be four transmission circuits for normal parallel working, the circuits being carried on two lines of towers. Two change-over stations are provided, each with air-break disconnecting switches, and divide the line into three sections for cutting out or interconnecting different sections as required.

. (To be continued.)

#### NOTES.

Smelting Tin Dross Electrically.—In the manufacture of tin plate large quantities of tin dross are formed consisting, say, of 50 per cent. tin, 8-12 per cent. zinc, and 10-18 per cent. iron. Hitherto it has been usual to charge batches of this dross, which varies considerably in composition, into reverberatory furnaces, together with soda ash and carbon sufficient to flux and reduce the dross, but yielding metal which is relatively impure, and needs more or less refining, according to the approximation of the actual furnace charge to that chemically desirable. If the dross be analysed before treatment, subsequent refining is simplified,

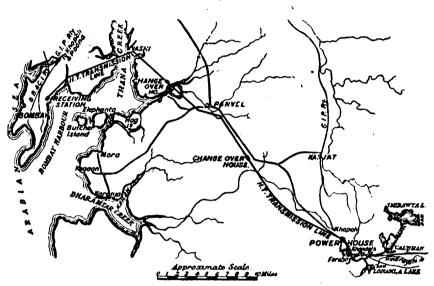

FIG. 23.-STORAGE LAKES AND TRANSMISSION LINE.

but such scientific procedure seems still to be exceptional amongst smelters, and, in any case, the ordinary reverberatory furnace process suffers from the defect that highly siliceous slags cannot be used, and practically all the copper and iron oxides in the dross are reduced to copper and iron, which must be separated from the crude tip by subsequent refining.

reduced to copper and iron, which must be separated from the countries the by subsequent refining.

By using an electric furnace it is possible to eliminate this serious disadvantage of the reverberatory process. A slag containing 66.6 per cent. silica, 16.6 per cent. lime, and 16.6 per cent. sods can be used. This forms silicates from the iron and copper exides present in the tin dross, but, if worked above 3,000°, the slag oxides present in the tin dross, but, if worked above 3,000°, the slag reduces tin oxide without forming tin silicate. At lower working temperatures as much as 15-17 per cent. tin collects in the slag, but at higher temperatures the loss is negligible, say, 0.5 per cent, and reduction is more rapid. As a result, metal tapped from an electric dross-furnace is much purer than from other furnaces, and the expense of refining is much reduced. To secure the best results it is necessary to analyse each batch of dross, and proportion the slag accordingly, but the cost of so doing, and the higher cost of energy for smelting, as compared with coal costs in reverberatory plant, are more than compensated by the saving in refining processes, reduced loss of tin and improved quality of product. There is no need to re-run slag in the electric furnace, owing to its low tin content; no addition of lead dross is required, and, by adding silica with the tin dross and carbon charge, the silica content of the slag can be kept constant and continuous operation maintained. It makes no difference to electrical resistance or results whether the slag can be kept constant and continuous operation maintsined. It makes no difference to electrical resistance or results whether the slags are soda, lime or iron-silicates, hence the formation of iron silicate does not disturb the working. Such is the experience quoted recently by R. S. Wile in describing the first commercially successful furnaces used in this service. These furnaces are of the shaft type, operated two in series on 230 volts, direct current, at 800 to 1,000 amperes. On starting the operation, slag is melted first by striking an arc and charging alag material round the electrodes. The latter are then raised gradually, and the operation is continued on the resistance principle, dross carbon and silica being fed in the proportions dictated by analysis. Air is practically excluded from the furnace, and, with 50 per cent. tin dross, the energy consumption is 300 kw.-hours per ton, i.e., 700 kw.-hours per ton of tin produced. per ton of tin produced.

Detecting Production Losses with a Tachograph.-With the aid of a recording tachograph, a device which shows the momentary speed variation occurring in the shaft or machine to which it is connected, the commercial department of the Dayton which it is connected, the commercial department of the Dayton Power and Light Co., Dayton, Ohio, was recently able to show a prospective customer that his engine-driven factory shafting underwent a recurring speed loss of 6 per cent. during each revolution. The same tachograph applied to a similar installation driven by an electric motor showed speed variations reaching a maximum of only 0.5 per cent. Such a tachograph, according to Mr. J. C. Matthieu, power engineer for the company, is of great usefulnees in revealing the production losses due to speed changes in engine-driven factories and in preparing the way for the obvious remed —electric motor drive.—Electrical World.

Institution and Lecture Notes.—Junior Institution of Engineers.—In the course of a lecture which he recently read before the Institution, on "The Electric Vehicle," Mr. B. J. Mitchell says that the phenomenal progress which the petrol vehicle has made during the past 15 years has obscured the fact that on the Continent of Europe, and more particularly in the United States, an immense advance has been made in the use of accumulator propelled commercial vehicles. There are now in operation in the American Union nearly 75,000 of these vehicles. Immense improvement has been made on the mechanical side, largely due to the work of the regular automobile engineer. The electrical engineer, on the other hand, has contributed his quota, and accumulators, electric motors and controllers, &c., are rapidly nearing perfection; in fact, it may be said that for practical purposes the modern electric vehicle would remain an exceedingly useful machine were it not improved for the next 20 years. The advantages of the electric are manifold, and include very low cost of operation. a safe speed, very slight damage to road surfaces, great handiness of operation, occupation of little floor space, total absence of fire risk, smoke, smell, &c., and the fact that they can be driven by relatively unskilled labour, with a minimum of tuition. An average maghine will give the equivalent of four gross ton-miles for one unit input of energy; this compares exceedingly favourably with the 30 to 35 ton-miles in commercial work obtainable from a gallon of petrol only on a very well tuned commercial petrol chassis. The mechanical wear and tear of thre electric motor is infinitesimal as compared with that of an internal-combustion machine, and an average figure appears to be about a quarter of 1 per cent. per 1,000 miles of travel, on the initial capital cost of the chassis only. Tires for electric vehicles have a specially long guarantee, and in actual practice far outlast the terms of such warranty; and the modern accumulator has reached the point

Institute of Metals.—Sir J. J. Thomson, O.M., D.Sc., F.R.S., will deliver this year's Institute of Metals May lecture, his subject being "The Passage of Electricity Through Metals," at the Institution of Electrical Engineers on Wednesday, May 12th, at 8.30 p.m. Visitors' tickets can be obtained on application to Mr. G. Shaw Scott, M.Sc., the Secretary of the Institute of Metals, Caxton House, Westminster, S.W.

In the absence on active service of Dr. G. D. Bengough, M.A.

In the absence, on active service, of Dr. G. D. Bengough, M.A., Honorary Investigator to the Corrosion Committee, now a captain in the Royal Garrison Artillery, the Council of the Institute of Metals has appointed Mr. W. E. Gibbs, M.Sc., as Acting Honorary Investigator to the Committee. Mr. Gibbs, prior to the outbreak of the war, was acting as Dr. Bengough's assistant in connection with the work for the Corrosion Committee. He is now engaged on a series of important investigations, the results of which will be embodied in the third report to the Corrosion Committee, which it is hoped will be presented at the forthcoming autumn meeting of the Institute.

Association of Mining Electrical Engineers.—At a joint meeting of branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers at Stoke, Mr. G. S. Corlett read a paper on the subject of colliery electric lighting.

At a meeting of the West of Scotland Branch of the Association of Mining Electrical Engineers, a paper was read by Mr. Andrew Gibson on "Bearings of Electrical Machinery."

Royal Institution.—The annual meeting of the members was held on Saturday afternoon, Sir J. Crichton-Browne, treasurer and vice-president, in the chair. The annual report of the Committee of Visitors for the year 1914, testifying to the continued prosperity and efficient management of the Institution, was read and adopted. Forty-four new members were elected in 1914. Sixty-two lectures and 19 evening discourses were delivered. The books and pamphlets presented amounted to about 338 volumes, making, with 652 volumes purchased, a total of 990 volumes added to the library in the year. The following gentlemen were unanimously elected as officers for the ensuing year:—President, the Duke of Northumberland; treasurer, Sir James Crichton-Browne; secretary, Col. Edmond H. Hills. The names of the managers included the following:—Sir Robert Hadfield, the Hon. R. C. Parsons, and Messers. Alexander Siemens and A. A. Campbell Swinton.

Copper.—Messrs. H. R. Merton's statistical circular for April 30th shows an excess of supplies over deliveries, and, therefore, an accretion to European visible supplies, a state of things not easily anticipated under present circumstances. The increase is 2,431 tons. There is a small increase registered for stocks at Havre-23 tons—and English stocks are up by 758 tons. In detailed supplies, European arrivals from N. America are lower than last month, amounting to something like two-thirds of the pre-war average. Supplies from Spain and Portugal to England and France are well up at 2,415 tons, or one-third more than the pre-war average. The quantity under "other countries" is slightly lower than the prewar average, as a set-off against unusually heavy supplies in March. Chile shipments are 4,218 tons, against a pre-war average of 3,280, while Australian are steady at 2,500 tons, but have not yet reached last year's figures. Total deliveries at 31,811 tons show smaller after the large quantity of last month, but have only been twice exceeded since last July. The considerable increase in price should have an influence on supplies for the coming month.

Appointments Vacant,—Assistant electrical engineer (£150), for Government of Malta; plumber jointer, for City of Sheffield Electric Supply Department. Particulars are given in our advertisement pages.

Electricity Committee-men and their Relatives.—
A very lengthy discussion took place on Thursday last week, at
the meeting of the Stoke-on-Trent Council, on the following
motion:—"That it be an instruction to the chief electrical
engineer that no further appointment of employés of the
electricity department be made from amongst relatives of members
of the Electricity Supply Committee." Councillor Sampson
Walker said that there were six members of the Labour Party on
the Electricity Supply Committee, and he was given to understand that five of them had sons working for the Committee. He
did not suggest that they were not earning their money, but it was
not proper in the interests of maintaining and preserving the
clean hands of the Corporation. He also said that it was not fair
to the electrical engineer. It was contrary to the interests of the
Council, the chief engineer, and of public government. An amendment was moved as follows:—"That it be an instruction to the
town clerk that no further appointment of employés who had
relatives on the Council should be made." Alderman Leese, in the
course of the debate, said that so far as he was concerned the
difficulty would be ended by the resignation of both his sons that
night. He complained that he had been most unfairly attacked.
The smendment was carried by 30 votes to 29. A further amendment was carried that no member of the Corporation should sit on
a committee under which he had a relative employed. The Town
Clerk intimated, in reply to a question by a member, that the
effect of the resolutions would be that the members affected must
resign their positions on the committee or that the relatives
must go.

A recommendation to increase the salaries of six members of the electricity staff was rejected. The Committee considered that in the interests of the department these salaries should be advanced, particularly in view of the fact that the staff had been seriously reduced owing to the war, and that extra duties had been thrown upon those remaining. The proposition was rejected on the ground that all Committees must be dealt with alike, as it had been decided that no increases of salaries should be given to those receiving more than £100 per aunum. Speakers seemed to be quite incapable of seeing any reason why electricity staffs should be treated differently from others. Perhaps they may have a rude awakening when they find out that a great need exists for central station men just now

Electric ('ooking Exhibit.—In connection with the "Women and their Work Exhibition," referred to on page 613 of our issue of last week, the Westminster Electric Supply Corporation were asked by the Daily Express to illustrate the advantages of electric cooking for women, and have organised quite an attractive exhibit with the aid of the Carron Co., Messra. Ferranti, Ltd., Simplex Conduits, Ltd., W. A. S. Benson & Co., Belling & Co., and the Dowsing Radiant Heat Co. The annexe has been fitted up as an electric kitchen with cooking stoves by the various makers; there are tables showing many of the electric specialities of the above makers, such as electric heaters, grills, hot plates, irons, and oricalcum wire. There is also an attractive show table for articles which are cooked in the kitchen. Short lectures are given at 3 and 6 each day, which are well attended, and practical demonstrations go on all day. The space is well lighted by indirect and semi-indirect systems, and some handsome alabaster pillars and vases lighted internally are shown by Mirs Ansten. This exhibition, which closus to-day, should do good work in bringing the advantages of electric cooking before the public, not only in the Westminster Co.'s area, but in most parts of London.

The Budget Speech.—The Chancellor of the Exchequer, in his Budget speech on Tuesday, showed the necessity that exists from a financial standpoint for maintaining the exports of the country during the war. He also expressed, from the same standpoint of finance, the view that the time had arrived when recruing should not be allowed to interfere with the output of munitions of war, and when it should be allowed to "interfere as little as possible with the output of those commodities which we export and which enable us to purchase munitions for ourselves and four Allies." This new attitude of the Government will be welcomed by those conducting engineering and other works where, notwithstanding the shortage of skilled labour, and that the product is for war purposes, the recruiting sergeant has, as stated in our pages last week, continued to exercise his persuasive powers with success.

Patents and Alien Enemies.—Applications have been made to the Board of Trade for the avoidance or suspension of the following patents:—No. 22,565/12, granted to Honold for runners for Francis turbines, by J. J. Armfield; Nos. 12,868/05, 12,869/05 and 12,870/05, granted to Goldschmidt & Weber, for the detinning of tinned plates, by G. H. Forrester; and Nos. 27,516/11 and 19,696/12, granted to Eickhoff, for trough conveyors and motors for operating reciprocating conveyors, by Babcock & Wilcox, Ltd.

Karachi Installation: ('orrection.—In our reference to this installation in our "Lighting Notes" last week, it should have been stated that Messrs. Crompton & Co., Ltd., carried out the whole installation. This included the erection of the mains supplied by Messrs. Henley.

Educational. — MUNICIPAL TECHNICAL INSTITUTE, Romford Road, Stratford, E.—Seven lectures on "Some Industrial Applications of Electricity," will be given on Monday evenings at 7.30 p.m., commencing May 17th. Further particulars are given in our advertisement pages.

#### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The municipality of Worcester, Cape Province, has appointed Mr. Johnson Tight, of Cradock, as resident engineer for the new electric lighting installation. There were 23 applicants for the position. The consulting tion. There were 23 applicants for the position. The consulting engineer (Prof. Boble) urged the Council to commence the wiring

engineer (Frof. Bohle) arged the Council to commence the wiring of the municipal buildings, as probably the street wiring would be completed before the whole of the domestic services were ready.

Mr. H. H. Sutcliffe having declined the appointment as assistant electrical engineer at Aylesbury, the U.D.C. has now appointed Mr. S. H. Fowles, of Belvedere.

The Erith U.D.C. has decided to pay a month's salary (£33 6s. 8d.) to Mr. Coveney, the late electrical engineer, as a grant for services rendered in a supervisory capacity for two months after the expiration of his resignation. months after the expiration of his resignation.

MR. P. SMITH, meter inspector at the Ilford electricity works,

has resigned his appointment

has resigned his appointment.

The Derby Electric Lighting Committee has appointed MR. G. H. HAYES, as assistant mains superintendent, at £2 per week, rice Mr. W. R. Poole, resigned; and has increased the salary of MR. A. THOMPSON, switchboard attendant, from £2 2s. to £2 7s. per week. The Coventry City Council E.L. Committee recommends that the salary of MR. G. TOUCH, engineer and manager of the electricity works, be increased from £650 to £750 per annum.

MR. H. D. WINCHESTER, district superintendent for the Newcastle-upon-Tyne Electric Supply Co., Ltd., at Durham City, was married to Miss Maidle Logie Robertson, at Edinburgh, on April 29th.

The salary of MR. J. FAIRCHILD, assistant electrical engineer at St. Annes-on-Sea, has been increased from £170 to £200 per annum.

St. Annes-on-Sea, has been increased from £170 to £200 per annum.

Tramway Officials,—Mr. L. J. YORKE, of the Underground Electric Railway mechanical engineering staff, who was gazetted to the 4th Yorks. Regiment in February last, left England for the front on May 5th.

General.—We understand that Mr. F. S. GROGAN, who during his eight years' active work in connection with the Tricity during his eight years' active work in connection with the Tricity cookers has acquired a unique position in the culinary branch electrical engineering, is about to sever his connection with the British Electric Transformer Co., Ltd., in order to take up an appointment as manager of a new concern for the manufacture and sale of electric fires and cookers. Personal communications should be addressed to him at 14, Argyll Mansions, Beaufort Street Chelesa S.W. et, Chelsea, S.W.

MR. A. B. KIBBLEWHITE, superintendent of the cable department of Callender's Cable and Construction Co., Ltd., Belvedere, has been elected chairman of the Erith Urban Council.

MR. CHABLES BRIGHT delivered an interesting lecture, on Nothing as Usual" at a meeting of the Tonbridge Chamber of lecture, on "Nothing as Usual" Trade held last week.

MR. J. SHEPHEED, electrical assistant in the L.C.C. tramways department, has resigned, and his resignation is to take place as from September next. It was reported at Tuesday's Council meeting that Mr. Shepherd had been in his present position since November, 1910, and had previously held the position of assistant electrical engineer. He has purchased the business of a consulting engineer, which he will take over on July 1st.

COUNCILLOR H. J. BOUCHIER has been appointed chairman of the Hindley Tramways and Electricity Committees.

COUNCILIOR BARNES has been appointed chairman of the

Atherton Electricity Committee.

Atherton Electricity Committee.

At the annual meeting of the Textile Institute, which is to be held to-day (Friday) in Manchester, SIR WILLIAM MATHER is to be elected president. Past presidents of the Institute have been associated with the cotton and woollen manufacturing industries, and Sir William Mather is the first president selected from the machinery and power branch of the textile industry.

MR. R. S. WADIE, who has been gazetted as Second Lieutenant in the 10th Batt. King's Own Lancaster Regiment, is the son of Mr. W. S. Wadie, electrical engineer, of Chiswick, W.

MR. J. H. DAVIES (late of the Salford and Greenook Corporation electricity department), who has been engaged erecting the electrical plant at Meeers. J. Levinstein & Co.'s Crumpeall Vale Works, nr. Manchester, has been appointed electrician-in-charge at the above works, and commences his duties on May 10th.

Obituary.—The Morning Post states that the death is announced of M. Hermann Jent, managing director of the Agence Telegraphique Suisse since 1902.

#### NEW COMPANIES REGISTERED.

Electrical Wholesalers' Federation; Ltd. (140,094).—This company was registered on April 27th as a company limited by guarantee, not having a share capital. For the purpose of registration, the number of members is declared not to exceed 100, but the committee may register an increase Each member is liable for not more than five guineas in the event of windinguo. The objects are: to promote and protect the interests of wholesale dealers in and factors and suppliers of electrical goods and appliances, to promote the consideration and discussion of all questions affecting the wholesale electrical trades, to procure, circulate and supply information (including status information) to obtain the most favourable terms and rates from manufactures of goods and from railway and shipping companies and other carriere, to encourage the settlement of disputes by arbitration, to act as or pominar arbitrators and umpires, to promote displays of electrical goods, machinery, appliances and fittings, and drawings of the same, at national and international exhibitions, and generally to watch over and protect the interests of

persons engaged in selling electrical goods and appliances. The subscribers are:—M. Beales, 12, Norfolk Street, W.C., engineer; F. Pooley, 25, Victoria Street, S.W., engineer; R. W. Smith, 1, Felix Street, S.E., engineer; F. Smith, 12, Norfolk Street, W.C., engineer; A. G. Beaver, 118-120, Charing Cross Road, W.C., electrical engineer; P. L. Davies, 1-3, Stanley Street, Liverpool, electrical engineer, G. O. Donovan, 47, Cornwall Street, Birmingo Ham, electrical engineer, All, persons, firms, or companies who are bona-fide wholesale dealers in or factors or suppliers of electrical goods and appliances are eligible as members. The management is vested in a committee of not less than seven or more than twelve members. The first members are to be appointed by the subscribers, who themselves constitute a provisional committee. Manager, F. S. Smith. Registered office: Amberley House, Norfolk Street, Strand, W.C.

Ferguson, Pailin and Co., Ltd. (140,150).—This company was registered on May 1st with a capital of £10,000 in £1 shares, to carry on the business of electrical, mechanical, hydraulic and general sanitary, gas and water engineers, switchboard and cabling makers, manufacturers of machinery and apparatus of all kinds, etc. The subscribers (with one share each) are: S. Ferguson, 7, Broadway North, Fairfield, Manchester, electrical engineer; J. Pailin, Glengarry, Queen's Road, Hazel Grove, Ches., buyer and director. Private company. The number of directors is not to be less than three or more than six; the first are S. Ferguson (permanent), J. Pailin, D. W. Pailin, A. Pailin, and G. Pailin, jun. Qualification, 500 shares. Remuneration, £50 each per annum. Sollcitor: R. A. Edgar, 20, Booth Street, Manchester.

#### CITY NOTES.

# Calcutta Electric Supply Corporation, Ltd.

THE directors' report for the year 1914 shows that 15;387,471 units were sold, compared with 14,070,927 units in 1913. The number of houses connected at December 31st last was 8,180, an increase of 583.

The profits for the year 1914 amount to £140,609 Exchange is calculated at 1s. 4d. per Rupee.

The profits for the year 1914 amount to £140,610, which, with the balance brought forward from 1913 and interest received on money at deposit, makes £148,141. After deducting the interim dividend of 3½ per cent., actual, paid on the ordinary shares in November, 1914; the dividends paid and accrued on the preference shares, and the other items set out in the net revenue account, there remains £102,476. £52,000 is to be placed to the credit of the depreciation and renewals account; £10,000 added to reserve fund; and a final dividend is to be paid on the ordinary shares, for the second half-year, at the rate of 5½ per cent., actual, making 9 per cent. for the year, leaving £11,482 to be carried forward, after providing for the directors' extra remuneration of £2,500, and a bonus of £1,406, payable to the staff in India. The reserve for depreciation and renewals will thus be increased to £188,629 and the reserve fund, with the addition of £2,011 from dividends on investments, will stand at £109,974. The expenditure on capital account last year amounted to £61,443, making the total £1,270,145. The demand for electrical energy continues to increase and the directors have, since the 31st December, 1914, found it necessary to issue additional capital. 1914, found it necessary to issue additional capital.

## Cuba Submarine Telegraph Co., Ltd.

The annual meeting was held on Wednesday at the offices, 58. Old Broad Street, E.C. Mr. George Ketth, who presided, said it was very satisfactory to note that during the past twelve months the company had managed to hold its position. There was a drop in the receipts for the first six months as There was a drop in the receipts for the first six months as compared with the previous year, although the last six months were an improvement on the preceding year's trading. There had been a large increase in their expenditure in connection with the West Indies Station, in consequence of the demand for overtime wages paid to the staff. The cable repairs in shallow water showed a considerable increase over last year, and they had also had the expenses of a new building to replace their old one which was destroyed at Cienfuegos. The total expenditure had amounted to £16.702 as against which total expenditure had amounted to £16,702, as against which the total receipts were £38,245, leaving a balance of £21,542, to which had to be added £7,849 from last year, making a total of £29,391 to be dealt with. £3,000 had been placed to the reserve against loss on investments, £2,500 to the pension fund, and £2,000 added to the general reserve fund, which now stood at £100,000. The directors now declared a further dividend of 5 per cent. on the preference shares, bringing it up to 10 per cent, less income tax, and 5 per cent. on the ordinary shares, free of income tax; this, he regretted, was rather lower than their usual dividend. He thought, in view of the increased rate, it would perhaps be advisable in the future to let the shareholders pay their own income tax, and make an increase in the dividend accordingly. This matter, however, was under consideration. The main cables, continued the Chairman, were all working well. The cable running from Santiago to Cape Cruz, which was broken by an earthquake, total expenditure had amounted to £16,702, as against which

Digitized by Google

was now being repaired and the expenses of that would come into the current year's accounts. Traffic over the company's cables had been well maintained, and he thought they would look forward to a good year.

Mr. Dryzell seconded the motion, which was carried unani-

The Chairman reported that they had received a letter from the British Red Cross Society, and he asked their permission to contribute 100 guineas to that worthy cause. The motion was seconded and carried.

## Stratford-on-Avon Electricity Co., Ltd.

Stratford-on-Avon Electricity Co., Ltd.

The directors report that although there has been a considerable accession of consumers during 1914, the revenue for the latter half shows a slight decline, owing partly to general economy in lighting and partly to the closing of one of the picture houses where a considerable amount of current was taken during the corresponding period of the previous year. The expenditure was higher principally in consequence of a general rise in all the requirements of the company. The directors might have recommended a small dividend, but consider it desirable, in face of the present outlook, to strengthen the reserve and slightly increase the amount to be carried forward. After writing off £200 to reserve and depreciation account and building sinking fund, making it £802, the available balance is £189. Directors fees absorb £50, and £139 is to be carried forward.

## British Thomson-Houston Co., Ltd.

British Thomson-Houston Co., Ltd.

The directors, in their report for 1914, state that prior to the outbreak of the war the company was making excellent progress in all its departments, but its business was seriously disturbed in many directions in August and September last. In a comparatively short time satisfactory re-adjustments were made to cope with the new conditions with the idea of doing as much work as possible to fill orders to meet, directly or indirectly, the requirements of the Government, and at the same time carry out so far as reasonably possible obligations to other customers. Over 1,000 employés have joined the Colours, being a large percentage of those eligible for military service. The loss of this number of employés, and the difficulty found in filling their places, even partially, has been a source of considerable embarrassment, but those who have remained have lovally supported the efforts of the management in all directions. For months past the company has been manufacturing munitions of war at its various factories, and has bought a large number of machine tools for this purpose. It is particularly gratifying to note that not-withstanding the disturbed financial conditions, collections were excellent during the whole of 1914; practically no customers availed themselves of the privileges afforded by the Moratorium, and losses from bad debts were so small as to be inappreciable. This conditions of affairs under the circumstances was remarkable, and indicated the strong financial condition of the country.

The buildings and machinery of the company had been maintained in first-class condition during the year, and all buildings under construction and authorised at the date of the last annual report had been completed and were now in use.

the last annual report had been completed and were now in

At the end of December, due to the number of employés joining the Colours who were familiar with the stocks of finished apparatus and work in progress, it was physically impossible, within a reasonable time, to take an actual inventory of the Rugby Main Factory, so that in making up the accounts for the vear the directors have relied upon the book figures and, although in the past years the inventory figures have shown a considerable increase over the book figures, and the directors have reason to believe the percentage of increase would have been equalled, if not exceeded, for the year 1914, they have taken no profit on this account, but have allowed the book figures to stand. In the Lamp Factory at Rugby, in the factories at Coventry and Willesden, and in all branch offices, a complete inventory has been taken in the usual way. The profits for the year, after deducting all expenses and charges other than interest on debentures and loans, are £130,868, plus £12,944 brought forward, making £143,812. The amount paid for interest on debentures and loans during the year was £56,705, leaving a net profit of £87,107. Of this amount the directors have thought best to appropriate for depreciations £73,309, so as to still further strengthen the company's position, and carry forward £13,798 to new account. Heretofore the first two items on the credit side of the company's balance sheet have been "goodwill, patents and licences." and "investment in Patent Owning Company." The second item is of substantially the same character as the first, and as the company owns all the shares in the "Patent Owning Company," the directors have decided to consolidate these items, and hereafter they will jointly appear under the first title only. Under the terms of the Trust Deed securing the issue of the company is debentures, the Company has this year At the end of December, due to the number of employes

to pay to the trustees the sum of £4,452 to be applied by them in redeeming debentures at 105 per cent. by drawings. Since the closing of the books debentures of the par value of £4,240 have been redeemed, making the total par value of debentures retired to date £30,025, and leaving a net amount outstanding at the date of this report of £181,975. The amount outstanding at the 31st December, 1914, was £186,215. The directors have followed their usual practice in making reserves to cover risks in connection with bad debts, and other contingencies. In addition to the amount shown in the profit and loss account, the directors have applied the reserve heretofore made, in writing down the debentures and shares held by the company, to the value now shown. During the year Mr. F. Fraser, secretary to the company, was appointed a director to fill an existing yacancy. existing vacancy.

Annual meeting, May 12th.

#### Eastern Telegraph Co., Ltd.

THE directors report that for 1914 the revenue amounted to £1.645,741, from which is deducted £621,866 for the ordinary expenses, and £164,583 for expenditure relating to mainten-£1.649.741, from which is deducted £621,866 for the ordinary expenses, and £164,583 for expenditure relating to maintenance of cables, sundry differences in exchange, income tax payable abroad, and interest on temporary loans, leaving £859,293, plus £25,687 brought forward, making a total available balance of £884,979. After providing for income tax payable in England, interest on mortgage debenture stock, and dividends on the preference stock, which in all absorb £177,237, there remains £707,742, out of which the directors have placed £390,000 to the general reserve fund, £5,000 to the insurance goods in transit fund, and have paid three interim dividends of 1½ per cent. each on the ordinary stock, aggregating £150,000. A final dividend on the ordinary stock of 1½ per cent. is recommended and a bonus of 2 per cent.. amounting together to £130,000, both payable on May 12th, free of income tax, and making, with the three previous payments on account, a total distribution of 7 per cent. for the year. It is proposed to carry forward £32,742. The general reserve fund has been charged with £273,973 in respect of new cables and other special expenditure, and after crediting the £390,000 referred to above, the net addition to the fund for the year is £116,027. Annual meeting: May 12th.

#### Dudley, Stourbridge and District Electric Traction Co., Ltd.

The annual meeting was held on Monday at the offices of the Electrical Federation, Kingsway. Mr. S. R. Blundstone (chairman) presided, and on his formal motion the report was adopted. This statement shows that the total revenue for 1914 was £50,780, compared with £52,843 for the preceding year. After payment of all expenses properly chargeable to revenue, interest on debenture stock, and placing £2,500 to the renewals fund, there was a surplus, including £75 brought forward, of £7,351. After putting to reserve £500, paying a dividend of 5 per cent, on the preference shares requiring £5,000, and a dividend on the ordinary shares at 1 per cent. requiring £1,000, £851 is to be carried forward. The company has continued to benefit during the past year from the operation of its tramways as part of the system worked by the Birmingham and Midland Tramways Joint Committee, and the arrangement has, therefore, been continued. THE annual meeting was held on Monday at the offices of the arrangement has, therefore, been continued.

## Wolverhampton District Electric Tramways, Ltd.

MR. S. R. BLUNDSTONE (Chairman) presided on Monday at the MR. S. R. BLUNDSTONE (Chairman) presided on Monday at the offices of the Electrical Federation, Kingsway, over the annual meeting. The proceedings were purely formal, and on the motion of the Chairman the report was adopted. This statement showed that during 1914 the total revenue was £28,359. After deducting all expenses chargeable to revenue, including debenture interest, repairs and maintenance, and providing £2,000 for the renewals, there remained a profit of £2,350 plus £134 brought forward. After placing to reserve £500 and paying a dividend on ordinary shares at the rate of 1 per cent. per annum, £386 is carried forward. The arrangement with the other companies operating tramways in the district for joint working under the management of the Birmingham and Midland Tramways Joint Committee has proved satisfactory, and has been renewed. and has been renewed.

## West African Telegraph Co., Ltd.

West African Telegraph Co., Ltd.

The revenue for 1914 amounted to £55,523, from which is deducted £17,633 for the ordinary expenses, and £8,536 for expenditure relating to maintenance of cables, sundry differences in exchange, and income tax abroad, leaving a balance of £29,354, plus £66 brought forward, making a total available balance of £29,420. £543 has been provided for income tax, £19,000 has been transferred to general reserve fund, and an interim dividend of 2 per cent. (free of income tax) absorbing £4,622, was paid on December 1st last. The directors now recommend a final dividend of 2 per cent. (free of income tax), payable on and after May 13th, making, with the interim distribution, 4 per cent. for the year, £633 being carried forward. Sir Albert J. Leppoc Cappel, K.C.I.E., has been appointed to a seat on the board, in the place of the late Mr. Robert Kaye Gray.

Annual meeting: May 12th.

# Johnson & Phillips, Ltd.

Johnson & Phillips, Ltd.

Mr. Robert W. Blackwell presided on Thursday last week over the annual general meeting, held at Winchester House, E.C. He said that the accounts showed a continued improvement. The 1914 trading profit, after the provision of £7,529 for maintenance of buildings and plant, stood at £37,119; £3,944 better than in 1913. He could repeat what he said at previous meetings—that the business was improving steadily in extent and value and would, in his humble opinion, continue to so improve. The balance sheet demonstrated that the company occupied a sound and strong financial position. They had a large amount of work in progress. The stock-in-trade had been taken on safe and conservative lines. Every department of the business showed a profit on the year's working. On December 31st, 1914, sundry creditors and bills stood at £100,063, against which they had sundry debtors amounting to £119,518, as against £94,311 and £107,855 respectively at the end of 1913. The stock-in-trade and work in progress represented £154,988; £4,558 less than the similar figure in 1913. Investments amounted to £2,368—patents, licences, etc., to £10,300—and cash in hand £15,509. During 1914 they spent on additions to buildings and plant £16,933 and set aside for depreciation £8,000. At the date of the balance sheet, the original issue of first debentures had been decreased from £175,000 ordinary £1 shares. That dividend would take up £8,750, and would leave to be carried forward £15,545. The board did not consider that it would be justifiable to declare a larger dividend under existing conditions. It was unnecessary for him to point out how all-important it was to preserve a strong financial position at this juncture. He looked forward to the future of Johnson & Phillips with every confidence. Its manufacturing plant was well maintained and had been vastly improved during the past few years. Its shops had been, and were, well employed, and he could see no reason why its turnover and profits should not increase steadily, Mr. T. DENCE seconded the motion.

The Chairman, in reply to questions, said he did not think the company had made investments in plant with a view solely to war business, and therefore he did not think at the end of the war they would be in possession of any machinery of doubtful value. They had made some additions and alteractions and done what was necessary to meet the demands of of doubtful value. They had made some additions and altera-tions and done what was necessary to meet the demands of the Government, but he was not aware of anything in the factory which would depreciate in value should the war stop to-morrow. Such new machinery as they had put in was being used partially for Government and partially for private being used partially for Government and partially for private contracts and was on the lines of the proper expansion of their business. The war had not benefited them, as the amount of work which they had offered them prior to the outbreak of hostilities would have put as great a demand upon the plant and would have resulted in practically as large a profit as anything they might look forward to obtaining from war business. In no sense did the prosperity of the company depend upon the continuance of the war—in fact they would like to see it over as speedily as possible.

The report was adopted.

# Indo-European Telegraph Co., Ltd.

Mr. J. Herbert Tritton presided on April 29th at the offices, 18, Old Broad Street, E.C., over the annual meeting. He said that the outbreak of war had an immediate effect upon 18, Old Broad Street, E.C., over the annual meeting. He said that the outbreak of war had an immediate effect upon all telegraphic communications, especially those connecting Germany with the Allied countries. The Indo route to India and beyond was totally interrupted in Germany on July 31st without notice and before the declaration of war. Later the cable connecting Odessa with Constantinople was disconnected at both ends. These interruptions had necessarily curtailed the usefulness of the company's system, restricting the working to the transmission of traffic between Russia and places east of that country. It might have caused the shareholders some surprise to see that the company's revenue had not diminished, although their route had been interrupted since July 31st, but some of them might remember that in the early days the company entered into reciprocal working arrangements with the Eastern and Associated Telegraph Companies. These arrangements provided for the maintenance of revenue of the different parties to the agreements for a specific period despite the fact that the revenue contributed by one of those parties might be reduced or entirely stopped. They had at times heard complaints made of such mutual working arrangements, but the position of the company might have been serious had no such arrangements been entered into, and thus case—indeed they had proved a necessary safeguard. They had already approached the British Government on the subject of the future of the company, and had received an assuject of the future of the company, and had received an assurance from the Government that facilities would be given to the company for the re-establishment of the Indo route. He did not propose to go further into the question of the route that would eventually be decided upon by the company, and must ask the shareholders to be satisfied with the statement that the matter was receiving the serious attention of the directors and that steps were being taken to ensure the con-

tinuity of the company's communications. The company's lines in Russia had been placed entirely at the disposal of the Russian Government, and they were glad to know that the Russian military authorities were making very considerable use of them. The company's line passed through a part, a considerable part, of the area where constant fighting was taking place and through the town of Warsaw. Since the war began, the London staff had been employed by the Eastern Co. in London. That company had suffered from severe pressure owing, amongst other causes, to the fact that the Indian and Trans-Indian traffic had been carried by their cables, and they were glad to assist them by the loan of their the Indian and Trans-Indian traffic had been carried by their cables, and they were glad to assist them by the loan of their experienced operators. It was satisfactory to learn from Sir John Pender, the managing director of the Eastern Telegraph Co., that they had rendered valuable services. The directors had voted £250 to the Prince of Wales's Fund as a first contribution. They had also made a contribution to the Red Cross organisation inaugurated by the Director-General of Telegraphs at Petrograd in connection with his department, and had received a graceful letter of acknowledgment from the Director-General. The war, of course, put a stop to practically all their wireless experimenting, and their large station in France was taken over by the French Government, whilst their small station in this country was taken over by their own Government. The directors proposed to set aside £10,000 towards wireless and other technical development. They weeks with a wireless transmitting set of comparatively small power hoping to make experiments in the course of a few weeks with a wireless transmitting set of comparatively small power coupled with reception by an improved Orling wireless relay, and they had every reason to believe that the experiments would give satisfactory results. The restoration of the company's route might very likely necessitate some experimental work, and the directors thought it prudent to set aside the sum mentioned in the report to meet the expenditure that would be incurred in making such experiments and assuring their position. The directors had decided that £25,000 be set aside towards possible downward fluctuations in the investments. Although the Government had fixed minimum prices ments. Although the Government had fixed minimum prices it must not be assumed that those prices were effective or would hold when the minimum had been taken off. In this would hold when the minimum had been taken off. In this they were making what might prove to be an over-provision, but in this case the company's reserves would have been strengthened. The financial side of the report called for little comment. The revenue for 1914 amounted to £189,383, showing an increase of £16,851, and the net result showed a balance carried to profit and loss of £100,988. This was the first occasion in the history of the company upon which their net revenue had reached £100,000. The expenses were £88,395, as compared with £91,441 for 1913. The decrease was accounted for by the interruption of their communications, certain items as compared with £91,441 for 1913. The decrease was accounted for by the interruption of their communications, certain item of expenditure having been lessened owing to this fact. The carry-forward, this year was £20,592, as against £6,461 last year. The directors were of opinion that a larger carry-forward was desirable at the present time. The principal, if not the only, item of interest in the balance sheet was the entry of £50,000 war loan, for which they were glad to be able to subscribe. The resolution amending Article 90 of the Articles of Association, recommended for accentance, was rendered of Association, recommended for acceptance, was rendered necessary by the exclusion of the non-Government German director from the directorate.

Sir W. B. Brooke seconded the motion and it was carried. In reply to a shareholder, the Chairman said the company were giving full pay to those of their staff who were serving with the Colours.

# Weston-super-Mare and District Electric Supply Co., Ltd.

The annual meeting was held on April 29th, at Electrical Federation Offices, Kingsway, W.C. Mr. Geo. J. Somerville, who presided, remarked that in the electricity supply section they had had an increase in income, in spite of their having supplied less current to the traction section. Owing to the war that section of the business had not been so remunerawar that section of the business had not been so remunera-tive as in the previous year, but that was a cause quite outside their control.

Mr. C. G. Tegetmeier seconded the adoption of the report, and it was carried.

and it was carried.

The report showed that the total capital expenditure at December 31st last amounted to £132,278. The accounts for the year showed a credit balance of £5,274 from electricity supply, £3,887 from traction, and £90 from sundry receipts, making £9,251. Deducting administration and general expenses £1,672, debenture and other interest £2,222, and placing £1,000 to renewals account, there is a balance of £4,356, plus £403 brought forward. There is to be placed to reserve £500, a dividend on the 6 per cent, preference shares absorbs £2,400, a dividend at the rate of 3 per cent, on the ordinary shares requires £1,050, and £809 is to be carried forward. The installations connected to the mains at December 31st, 1914 (excluding the traction section) represented the ber 31st, 1914 (excluding the traction section) represented the equivalent of 40,489 lamps of 8 c.p., an increase of 3,364. The number of consumers during the year increased from 505 to 597. The total revenue advanced by £460, and the expenses by £328, the net result being an improvement of £132. The gross receipts from the traction section were £7,091, a decrease of £1,646, due to the war. The expenses amounted to £3,204, leaving £3,887, a decrease of £1,377 compared with 1913.

## Oriental Telephone and Electric Co., Ltd.

MR. II. JOHNSTONE GREWING presided over the annual meeting, held on April 28th, at the Great Eastern Hotel, E.C. He first alluded to the recent death of Mr. B. St. John Akers, who first alluded to the recent death of Mr. B. St. John Akers, who was the oldest shareholder in the company and served on the board for over 30 years. The vacancy had been filled by the election to the board of Mr. Ness. As to the addition of other directors to the board, it was suggested that two be left in abeyance for the moment, because, as the shareholders had been advised by various circulars, proposals would be made as early as possible, some of which effected a possible rearrangement of the board. As to the accounts, in spite of the great events which had taken place since they last met, the progress of their branches had been maintained. It would be idle to pretend that the war had not affected them, as it had everybody else, but they had not been affected to the extent that many undertakings had. At the beginning of it had everybody else, but they had not been affected to the extent that many undertakings had. At the beginning of August there was a slump everywhere, but as soon as the first shock had passed, things recovered, and he was glad to say there was an increase in all their branches, although not so great as they might have hoped for in normal times. In the case of the China Co., there was a net increase in the revenue for 1914 of £1,619, and the number of new lines added to the system was 25. The Bengal Co. showed an increase of £3,143 in net revenue, and 358 new lines had been added. The Bombay Co. showed an increase of £2,403 in revenue and 190 lines. The dividends paid by the two former companies were the same as last year, viz., 5 per cent, for the China Co. and 7 per cent, for the Bengal Co., and in the case of the China Co. it would have been possible to have increased the dividend, but they thought perhaps under the present conditions it would be better to keep to the old figure. The Bombay Co. had felt itself able to increase its dividend to 16 per cent. tions it would be better to keep to the old figure. The Bombay Co. had felt itself able to increase its dividend to 16 per cent. He might mention in connection with the Bengal and Bombay Companies as to the remark in the auditors' certificate as to the valuation of the investments in subsidiary companies, that the latest quotation for the Bengal Co.'s 100 rupee shares was 125 rupees, and for the Bombay Co.'s 25 rupee shares 83 rupees. As regarded the Egyptian Co., as they knew Egypt had been more affected, perhaps, than any of the Eastern agencies by the war, and, in addition, for the last seven or eight years it had had a series of misfortunes. First there was the financial crisis in 1907, and then came the Turkish-Italian war, and next the Balkan war, and now the European war. Anyone acquainted with the population of Egypt, consisting as it did so largely of Italians, Greeks, French, Turks and Arabs, would not be consisted that these events affected Egypt much more than they would any of their exchanges further East. To have been able to maintain their position under these circumstances would have been an achievement of no small merit, but in been able to maintain their position under these circumstances would have been an achievement of no small merit, but in addition they had been able to show some slight advance on the previous year, which must be considered as particularly satisfactory under the circumstances and highly creditable to their officials and staff. This applied with equal force to their officials and staff further East. At most, if not all, of their exchanges, very considerable demands had been made upon their services in connection with telephonic communication both by the military and civil authorities and the comtion, both by the military and civil authorities, and the company had succeeded in meeting their requirements in every case. In fact, their managers had been complimented upon the assistance they had been able to offer.

Mr. Hibbert formally seconded the motion, and said the shareholders knew that another meeting would take place shortly at which the action taken by a shareholders' committee would be dealt with.

Sir Fortescue Flannery expressed great surprise that the motion should have been put before the meeting without some further explanation of what was a matter of public knowledge. He referred to the action taken by Mr. Bailey before Mr. Justice Astbury first, and afterwards before the Court of Appeal, for the restitution of large sums of money by the directors to the shareholders. The result of both actions was in favour of Mr. Bailey. If he understood the circulars which had been sent round to the shareholders, there were at present negotiations going on between the directors actions was in favour of Mr. Bailey. If he understood the circulars which had been sent round to the shareholders, there were at present negotiations going on between the directors and Mr. Bailey and his committee for a settlement of the matter with the object of avoiding further litigation. That settlement, he understood, included the restitution of many thousands of pounds by some of the directors—money which they had actually drawn and received, and which was now in their possession. If the meeting carried the report which contained the paragraph as to the re-election of Mr. T. Lloyd and Mr. H. J. Grewing to the board, he ventured to think the shareholders would be stultifying themselves. If the meeting was going to be adjourned for the purpose of receiving Mr. Bailey's report he saw no useful purpose which was going to be served by passing the report that day.

Mr. Skellows said he had not the least notion where they stood. All he knew was that a certain Mr. Bailey, with whom he was not acquainted, had agitated in conjunction with Mr. Ness, who also he was ignorant of. He was given to understand by a member of the board that the principal object of the agitation was to oust the old board, and if that was so, he congratulated Mr. Ness on having found a place on the board. That congratulation was coupled with a certain amount of sympathy with the gentlemen on the board having to put their hands in their pockets for the sum of £53,000. Mr. Skelding proceeded to refer to a circular sent round, in which the board suggested that if the Court had been in real possession of the facts, they would not have made

such scathing denunciations against the directors. Apparently they blamed counsel or the solicitors, and if so, why was it that the solicitors still remained with the company? The fact was that the shareholders had been left in the dark and had been told that the board would use the proxies of those silly people who sent proxies. The company was flcurishing, and why should the board not be content to join in the advantages of a flourishing company without grasping for huge sums of money like he had referred to, instead of letting the shareholders know exactly what was being done? A shareholder asked whether if the report was not adopted that day, it would mean that a dividend could not be paid.

A shareholder asked whether if the report was not adopted that day, it would mean that a dividend could not be paid. The Chairman said that was so.

After further discussion regarding the adjournment of the meeting, the Chairman said that negotiations of an informal character had taken place with the Committee, and it was the intention to have called a meeting and to lay the proposal before the shareholders for an amicable settlement of the matter. For various reasons the meeting could not be called, and the death of Mr. St. John Akers had placed a further obstacle in the way. But he could assure them that nothing which could take place at that meeting would prejudice what might be arranged later on. Mr. Lloyd did not intend to offer himself for re-election, and with regard to himself, his re-election would depend entirely upon the shareholders, and if it was the wish that he should retire in favour of someone else he would do so.

Mr. Ness said he was one of the Committee to meet the

Mr. NESS said he was one of the Committee to meet the directors to try and arrive at an amicable settlement. It was a pity Mr. Bailey did not issue a circular informing the shareholders of what had been done, but such a circular was actually drafted and would have been issued but for Mr. Akers's death. After the hearing of the case in the High courts a committee of shareholders met together and thought it would be in the interests of the company to have some conferences with the directors, and this had been done. conferences with the directors, and this had been done. Eventually they succeeded in coming to a conditional understanding. Any compromise was, of course, conditional as the committee had no power to bind the shareholders. His own impression was that when they knew the terms, the shareholders would be satisfied. It consisted of three points: The first was a very substantial refund on the part of directors of moneys they had received. (A voice: "Why not all?") It was not possible to get everything one wanted, and if they had insisted on getting too much they would have been landed with litigation in the House of Lords. Put briefly, the compromise included a refund equivalent to a 12 per cent. deferred dividend which would be paid immediately on the conclusion dividend which would be paid immediately on the conclusion of the transaction. Then three new directors were to be appointed, and there was to be a revision of the terms of renuneration and a fixed sum paid instead of a percentage of profits.

Answering a question as to the present terms of remunerarion, the Chairman said the five directors of the Oriental Co. got £300 each, the four directors of the Egyptian Co. £200 each, and the three directors of the China Co. £175 each. This was exclusive of commission on profit in the Egyptian Co., which amounted to about £500 for each director.

The Solictron endorsed the Chairman's statement that the prescint of the report would not projudice the shorthylder.

passing of the report would not prejudice the shareholders action at the meeting which was to be called. The liability of the directors did not arise as directors of the Oriental Co., but as directors of the Egyptian Co. Everything they received as directors of the Oriental Co. was perfectly in order. There was still the House of Lords, who might say that the money

should not be paid.

The report was adopted by 20 votes to 13. Votes of thanks were passed to the Chairman and staff, and to Mr. Bailey.

# Kidderminster and District Electric Lighting and Traction Co., Ltd.

MR. J. A. LYCETT (Chairman) presided on Monday, at the Electrical Federation Offices, Kingsway, over the annual meeting. He formally proposed the adoption of the report, which was seconded by Mr. S. E. GARCKE and agreed to. The report stated that the total capital expenditure at December. 1914, on buildings and plant, etc., for electric supply amounted to £57,723. The net receipts of the lighting department were £4,261. Adding dividends receivable, £1,955, and the amount brought forward, £204, there is a total of £6,421. After deducting administration and general expenses, reserve for doubtful debts, interest on temporary loans and debenture interest, there remains £2,468, from which there is to be put doubtful debts, interest on temporary loans and debenture interest, there remains £2.468, from which there is to be put to reserve £750; dividend on cum, pref. shares for the year absorbs £1.500, leaving to be carried forward £218. The company has sold its motor omnibus interests to the Worcestershire Transport Co., and now holds 11,109 £1 shares (fully paid) out of a total of 19.347 shares issued by that company. The report of the Kidderminster and Stourport Electric Transway Co. for 1914 shows that no additional expenditure capital account was incurred. The profit on working, after providing for renewals, is £1,964, plus £129 brought forward, leaving an available balance of £2,093. Out of this there has been applied to reserve £500, and to dividend at the rate of 24 per cent. £1,430, carrying forward £163. The directors regret that owing to pressure of other business, Mr. C. Shirreff Hilton has resigned his seat on the board. Mr. Lycett has been appointed chairman. been appointed chairman.

# Lisbon Electric Tramways, Ltd.

The directors report that the result of the company's operations for 1914, after deducting interest and amortisation due on the debentures of the "Companhia Carris de Ferro de Lisboa" and after the payment of £25,610 for interest on and redemption of the debentures of this company and also the payment of London office expenses and directors' remuneration, shows a net profit of £84,709, plus £1,749 brought forward. £15,000 has been placed to the credit of depreciation reserve, £5,000 to exchange reserve, and £19,013 formerly standing to the credit of "premium on ordinary share capital," has also been transferred to depreciation reserve to adjust the decrease in this year's appropriation from the profits. Out of the available balance of £66,458, the usual 6 per cent. preference dividend, amounting to £25,533, has been paid. On November 12th, 1914, the directors paid on the ordinary share capital an interim dividend of 3 per cent. net, amounting to £19,021, and they now recommend a final dividend at the same rate, making 6 per cent. net for 1914. The balance of £2,883 remaining to the credit of profit and loss account has been carried forward to next year's account. The tramways have carried 63,758,037 passengers, earning Es. 1,938,210 \$70,3, as compared with 58,840,923 passengers, earning Es. 1,861,056 \$93,9 in 1913. The traffic, therefore, has been more than maintained, but the increased cost of supplies, especially coal, and the falling off in the average rate of exchange from 46,199d. to 43,43d., both of which adverse factors were brought about by the disturbing conditions caused by the war, have resulted in a diminution of the profit to the extent of nearly £20,000. The extension of the power plant was completed during the year, and is in satisfactory operation. One of the most important of the Ascensores lines was electrified and re-opened to traffic during the period under review, and the remainder of the system will be completed in the course of the current year. No further progress has been made in the ne THE directors report that the result of the company's operamade in the negotiations with the Municipality mentioned in last year's report. The board regret the death of Mr. S. W. Jameson, who was secretary of the company since its inception. Mr. F. Haines, who was acting secretary, has been appointed his successor. The board record their appreciation of the services rendered to the company by the members of the local board in Lisbon, by Mr. A. O. Kolkhorst, the general manager, and by the entire staff.

Annual meeting: May 12th.

Craigpark Electric Cable Co., Ltd.—For the year Craigpark Electric Cable Co., Ltd.—For the year ended March 31st, 1915, the accounts show a net profit of £8,906, plus £1,391 brought forward, making £10,297. There is put to depreciation off buildings and machinery £2,500, to reserve account £1,000, to dividend on 6 per cent. preference shares £2,850, to dividend on 37,500 ordinary shares, at 6 per cent., for the year £2,250, leaving to be carried forward (subject to payment of directors' fees) £1,697. Business during the year was satisfactory, although the output of the company suffered somewhat from the dislocation inseparable from the war. The value of orders on hand at the moment is considerable, and the prospects for the coming year are good. The directors regret to report the death of Mr. William Henri Luther, who was appointed a director only last coming year are good. The directors regret to report the death of Mr. William Henri Luther, who was appointed a director only last year. Annual meeting, May 12th.

Chloride Electrical Storage Co., Ltd.—A dividend of 10 per cent, on the ordinary shares is recommended for the

Auckland Electric Tramways Co., Ltd.—An interim dividend of 7d. per share, less income-tax, on the ordinary shares is announced.

Submarine Cables Trust, Ltd.—The directors report that the revenue for the year ended April 15th amounted to £25,175, and the expenses to £1,359, leaving £23,816, plus £30 brought forward. After providing £16,236 to meet payment of the coupons, £7,560 has been transferred to the redemption fund, leaving £50 to be carried forward.

Alderley and Wilmslow Electric Supply, Ltd.—The annual meeting was held on April 27th. The directors' report, to which brief reference was made last week, recorded the death of a director of long standing in the person of Mr. John Royle. Mr. H. S. Hadwen has been elected to the vacancy.

Anglo-American Telegraph Co., Ltd.—The directors' Anglo-American Telegraph Co., Ltu.—The directors report for the year ended March 31st, 1915, states that the dividends paid absorbed altogether £262,500, being the rent paid by the Western Union Telegraph Co. for the year, equal to 3% per cent. on the ordinary stock, 6 per cent. on the preferred stock, and 1½ per cent. on the deferred stock. The balance at credit of revenue account (£71,250) includes £5,625 interest received, and the balance of £65,625 is available for the payment of dividends for the quarter to March 31st, 1915. for the quarter to March 31st, 1915.

Tramways and General Works Co., Ltd.—A dividend of 61d, per share, less income tax, for the year is recommended, carrying £207 forward.

District) Tramways, Ltd. **Vorkshire** (Woollen The revenue for 1914 amounted to £65,385, an increase of 2,876. After deducting all expenses chargeable to revenue, including repairs and maintenance, payments to local authorities under agreements, debenture and other interest, and setting saide ander agreements, depending and other interest, and setting selecting selections. \$4,500 to renewals fund, there remains \$9,696, plus \$1,891 brought forward. There is to be put to reserve fund £2,000, to dividend at the rate of 3½ per cent, per annum on the ordinary shares £7,001, carrying forward £2,586.

Chiswick Electricity Supply Corporation, Ltd.—
The directors report a capital expenditure of £4,357 during 1914.
The profits, after paying sinking fund premium and trustees' fees, were £8,386. Interest on first mortgage debenture stock amounting to £3,600 has been paid, leaving £4,786 to the credit of the net revenue account. A dividend at the rate of 6 per cent. for the year is recommended, carrying £1,018 to depreciation reserve fund

Eastern Extension, Australasia and China Tele-Eastern Extension, Australasia and China Telegraph Co., Ltd.—The gross receipts for the year 1914 amounted to £819,583, against £738,129 for the previous year. The working extenses, including £61,174 for maintenance of cables, absorb £364,978, against £354,864 for the previous year, leaving a balance of £454,604. From this is deducted £13,754 for income-tax payable in England, and £30,096 for interest on debenture stock, leaving £410,753 as the net profit, plus £30,616 brought forward, making £441,370. Three interim dividends of 14 per cent. each have been paid for the year, and it is now proposed to distribute a final dividend of a like amount on dividends of 14 per cent. each have been paid for the year, and it is now proposed to distribute a final dividend of a like amount on June 12th, making a total dividend of 5 per cent. It is also proposed to pay a bonus of 4s. per share, or 2 per cent, making a total distribution of 7 per cent, for the year. £200,000 has been transferred to the general reserve fund, and £31,370 is carried forward. The balance of cost, amounting to £194,078, of the Penang-Singapore-Hong-Kong cables has been charged against the general reserve fund. £35,443 has also been charged against the fund for partial cable renewals carried out during the year, together with the loss amounting to £43,901 incurred on the sale of investments. of investments.

Buenos Ayres Port and City Tramways, Ltd.—In a circular issued to holders of 6 per cent. first mortgage debenture stock and 6 per cent. extension first mortgage bonds, it is stated that the committee representing both classes of debenture-holders consider that the best interests of the debenture-holders would be consider that the best interests of the debenture-holders would be served by the adoption of a scheme for consolidating and rearranging the funded debt, thereby avoiding difficult questions which would inevitably arise if receivers were appointed. The trustees concur in this decision. It was anticipated that it would have been possible to submit a scheme of reorganisation before this date, but, unfortunately, delays have occurred, through technical difficulties, in dealing with matters connected with the finating debt of the company, which it is hoped may shortly be overcome.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the four weeks ended February 26th amounted to 990,763, compared with 1,080,419 in the corresponding four weeks of 1914. For the four weeks to March 26th the figures were 1,212,991 for 1915, and 1,220,009 for 1914. It is stated that general slackness of trade in Calcutta, owing to the war, has caused the above decreases.

South Wales Electrical Power Distribution Co.-The report states (says the Financier) that as, under the working arrangement with the Treforest Electrical Consumers' Co., Ltd., the whole of the working expenses in connection with the undertaking are now borne by that company, there is, for the time being, no revenue account to be submitted. Notwithstanding the dislocation of trade during the last five months of the year, the business of the company shows an increase, the units sold amounting to 26,510,198, as compared with 25,812,031 sold in 1913, an increase of 20,510,196, as compared with 29,512,051 sold in 1915, an increase of 698,167 units. The surplus, after payment of all working expenses and interest on prior lien debenture stock, and making due provision for depreciation of new plant, amounts to £5,347, as compared with £2,915, the surplus for 1913, an increase of £2,431. The accumulated profits are now sufficient to deal with the indebtedness of £13,500 due to certain members of the Treforest Co. for overcharges, as explained in previous reports. indebtedness of \$13,500 due to certain members of the Treforest Co, for overcharges, as explained in previous reports. The continued expansion of the company's business necessitates the provision of further capital, for which the requisite steps are now being taken by the directors under the borrowing powers already possessed by the company, and, subject to these and incidental arrangements being accomplished, the directors confidently look forward to being able to make a payment in respect of interest on the original debenture stock in the course of the coming year.

Costa Rica Light and Traction Co., Ltd.—At a meeting of the holders of the 6 per cent. prior lien debentures, held on Wednesday, resolutions were, according to the Financial Times, to be submitted to release the company from liability to make payments to the sinking fund until May 15th next following the expiration of one year after the termination of the present

Reduction of Capital.—Gell Telegraphic Appli-ANCES SYNDICATE, LTD., AND REDUCED.—A petition for the confirmation of the reduction of capital from £40,000 to £20,000 has been presented, and will be heard on May 11th.

#### STOCKS AND SHARES.

TUESDAY EVENING.

A good many of the markets in the Stock Exchange have come to something like a pause, investment and speculative investment both being checked by the recent news from investment both being checked by the recent news from France, and, still more, by that from Russia. Although so neatly wrapped up in the official dispatches, the advance established by the Germans has not been ignored by those closely following the sphere of operations in the Western theatre; and that the enemy should have progressed at all, just at the time when the Allies were expected to make a sweeping forward movement, has caused a little disappointment to those who profess to see in it something more than the mere ebb and flow of events connected with a great war. As regards the Russian operations, the German tales are, of As regards the Russian operations, the German tales are, of course, not credited without confirmation from Petrograd, but it is thought that our Allies may have suffered a setback.

Moreover, the grave statements with reference to labour difficulties which have been contributed by Admiral Jellicoe, Mr. Lloyd George, the Director of Transports, and others combine to produce a feeling of uneasiness in the minds of the investing public. Money itself remains almost ridiculously easy—the result, principally, of the disposition of capitalists, large and small, to keep their cash resources liquid rather than employ them in Stock Exchange channels for the time heind

being.

The Home Railway market continues to give way, in consequence of the labour troubles. Principally, the demands made by the Miners' Federation for an increase of 20 per cent. in wages are responsible for the refusal of the public to put money or faith into the leading industry of the country. It is true enough that the floating supply of stock is comparatively small—a factor which will assume correct proportions as soon as any attempt is made to buy Home Railway stocks. Just at present, however, such attempts are conspicuous only by their absence; and the result is reflected in what dealers in the market euphoniously call a softening process, in contradistinction to the "hardening" of values which might have been expected to take place at the present time, had it not been for the labour unrest.

in the market euphoniously call a soltening process, in contradistinction to the "bardening" of values which might have been expected to take place at the present time, had it not been for the labour unrest.

Metropolitans and Districts drooped, with the rest. Central Londons keep steady, and there are one or two buyers about of the Company's ordinary assented stock. The Underground Electric group as a whole, apart from the two issues mentioned, maintains its ground with more tenacity than is shown by the Steam stocks. There is little setback in the prices of debentures and preferences—a testimony to the determination of investors to retain their holdings for better times, rather than evidence of demand to-day.

The Telegraph market is one of the firmest in the electrical departments. Cuba preference rose 10s. Great Northerns at 32 are £2 up, thanks to the increase in the dividend. Globe preference eased off a little. Indo-Europeans at 56 are £1 higher, very little inquiry sufficing to put up the price. Anglo-American deferred slipped back \(\frac{1}{2}\) on a few profit-taking sales by those who bought the stock some weeks back at a lower figure and who consider themselves fortunate in being able to take a quick turn in war time, but the preferred regained all the 1\(\frac{1}{2}\) per cent. dividend deducted last week from the price. Eastern Extensions are firm on the issue of what, in the circumstances, must be regarded as an excellent report.

Telephone shares are also wanted. There are rises this week in Chilis, United River Plate, and Orientals. New York Telephone 4\(\frac{1}{2}\) per cents. are 98, ex the half-yearly interest; allowing for deduction of tax, the movement on the week is practically nil. Marconis remain at 1\(\frac{1}{2}\), Canadians at 5s., Americans at 10s. 6d. There is nothing much to induce purchases of Marconis while other markets are dull, but in any breath of revival the optimists who profess to see the shares at £2 are quite likely to be justified. The Telegraph Manufacturing group i

par value; British Insulated at 11½ are easier to sell than they are to buy.

Brazil Tractions are lower at 55½, which, allowing for the dividend, makes a fall of a point on the week. The shares fell, in company with most of the active securities round the House, on Tuesday (to-day), when the effect of the Russian news was to make most things weaker. Mexicans are fairly steady, and Anglo-Argentine Tramways 1st preference continue to improve. The Buenos Aires Port and City Tramways Co. has circularised its bondholders, through the committee, to the effect that a new scheme of re-organisation is under conthe effect that a new scheme of re-organisation is under consideration. There is an idea that a fresh first charge debenture

the effect that a new scheme of re-organisation is under consideration. There is an idea that a fresh first charge debenture stock will be issued, and possibly income bonds as well, in exchange for the existing bonds.

The Home Electricity list is very quiet. County of Londons stand at 1 harder at 111, but apart from this there is not a quotable change in the catalogue. Nor is the Miscellaneous list much different, from the point of view of movements in prices. Castner-Kellners are good at  $2 \frac{1}{16}$ , and there was a slight recovery in Edison & Swan partly-paid shares. The Chiswick Electricity Supply Corporation proposes to pay a dividend on the shares at the rate of 6 per cent, for the year.

East London Railway ordinary stock has been changing hands fairly frequently about 41, and this has caused a recrudescence of some of those runiours with which we grew so

descence of some of those rumours with which we grew so familiar some years ago, as to the company being taken over

by one or other of its bigger brethren.

Rubber shares have weakened, on profit-taking by those who Rubber shares have weakened, on pront-taking by those who thought, justifiably enough, that prices had been run up rather rapidly, and that a time of reaction was due. The price of the raw material, after giving way for several consecutive days, took a turn for the better and is on the mend again. Armament shares are also droopy, mainly on account of the Comment's decision to curtail war profits and on the of the Government's decision to curtail war profits and on the serious state of affairs which is said to prevail amongst a section of the men employed upon the work of turning out munitions of war. The Budget is not likely to affect the stock markets in any material manner.

#### METAL MARKET.

# Fluctuations in April.

A New Radioscopic Process for Localising Bullets.—A very simple method of finding the depth of a foreign body in the flesh is described in the Genie Civil, as the invention of Messrs. Hirtz & Gallot. The patient is laid on a table, with the X-ray tube beneath it, and a fluorescent screen with a hole at its centre is supported above him. The tube and screen are moved so that the vertical ray from the tube throws the shadow of the bullet or splinter on the hole in the screen, and a mark is made on the skin of the patient at that spot. The tube is then moved in any direction in a horizontal plane, and the new position of the shadow is marked on the screen. The patient is then removed, and the screen replaced in the same position as before. The tube, still in its last position, is operated, and a plumb bob is lowered through the hole in the screen, until its shadow falls upon the spot marked on the screen: the bob is then in the exact position previously occupied by the bullet, and the depth of the latter is thus at once obtained.

East Africa Protectorate.—The annual report for 1913, by Mr. F. W. Msjor, Chief of Customs, East Africa Protectorate, shows that the value of imports of electrical apparatus advanced by £3.481 to £6.970. Industrial machinery imports were up by £15,199 at £66,771. All classes of metals, manufactured and unmanufactured, porcelain, china and earthenware, iron and steel ware, and hardware, also scientific instruments showed satisfactory advances. The enormous expansion in industrial machinery is more apparent when it is mentioned that the figure of £66,771, compares with only £21,065 two years earlier. Machinery imports of all kinds take the fifth place in order of value. Telegraph materials almost entirely British imported for the past three years have been £16,795, £19,839 and £10,048 for 1912-13-14 respectively.

#### POWER PLANT TESTING.

AT a meeting of the SCOTTISH LOCAL SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on April 13th, a discussion took place on Mr. Selvey's paper on power plant testing, which was abstracted in our issues of December 11th and 18th, 1914.

Mr. W. W. Lacrie (Glasgow), while agreeing that in cities, towns, and areas having a population of over 500,000 there would be a complete obsolescence, in from eight to ten years, of plant purchased at the present time—rated at less than 5,000 kw. in the case of turbo-alternators or 30,000 lb. for boilers—he did not think that this was a correct statement as applied to smaller towns. He agreed that they might look forward to a load factor of approximately 50 per cent. on their works, and that economy in fuel ought to be one of the first considerations in buying new plant; but in his figures to show the importance of low steam consumption, he thought Mr. Selvey rather over-stated the case. Mr. Selvey had entirely omitted to take into consideration the extra interest, depreciation, and sinking fund on the additional £24,000, and that at 8 per cent. represented £1,900, or over £15,000 in eight years. The net result was that the machine taking 1 lb. less per kw.-hour on 8,000 hours' load was worth only £8,600 more, and on 4,000 hours' load it would be worth only £4,300 more. He did not wish to depreciate the importance of steam consumption, indeed Mr. Selvey could have gone further. If a set of turbines was bought to take 5 per cent. less steam it followed that 5 per cent. less boiler plant would suffice also. As to the testing of plant, within recent years they had had to test 3,000, 4,000, and 6,000-kw. turbines and boilers of 30,000 lb. evaporation. One series of tests represented ten sets of readings, and it took 110 sheets of foolscap to make a proper record of these tests, necessitating a staff of 20 to 24 men, but the importance of having the facts accurately set down was seen when one remembered that every tenth of a pound of steam over 13.7 lb. meant a penalty of £750 to the contractors. He did not think that any manufacturer would agree to let the plant run for six months before a test was made, unless he got payment for the plant on erection, and alternatively, no buyer would agree to pay for the plant u

opportunity of examining the turbine, and there should be no decrease in the efficiency of the turbine at the end of that period.

Mr. Page (Glasgow) pointed out that the difficulties between buyer and seller arose when the tests proved non-compliance with the specification, more especially if the tests were carried through by engineers in the buyer's employment. This showed the desirability of having specialists who would be accepted by both parties to carry out tests. The trouble all along had been that there were so many variables. On getting in tenders, the steam consumptions were invariably given with a margin of 2½ per cent. They had succeeded sometimes in getting the successful contractor to depart from this stipulation, but the L.E. Model General Conditions embodied an allowance to cover errors in observation. The remarks on obsolescence hardly applied to boilers in the same sense as to turbines. The smaller size of water-tube boiler with, say, 4,000 sq. ft. heating surface, installed 20 years ago, was just as efficient to-day as boilers put down recently. The same certainly could not be claimed for turbo-alternators. He could confirm what was done in power stations with new turbines in running them almost continuously. Fifteen months ago the Glasgow Electricity Department installed a 6,000-kw. set. It was hardly fair to take the figures for the first six months, because during that time the turbine had to be tuned up, but if they took the second six months of the first year of that plant's life, he found they ran this 6,000-kw. set for 55 per cent. of the total load, and that it was responsible for 22½ million units out of a total output of 33½ million units out of a total output of 33½ million units out of a total output of 33½ million units, which only left 11 million units to be taken from the other plant. The capacity of the plant was 22,000 kw., leaving 16,000 kw. after the 6,000 kw. set was accounted for. Over the year the 6,000 kw. machine generated 40,000,000 out of the total of 61,000,000 unit

As to fuel analyses, they found they could now buy coal on the daily figures obtained in the Electricity Department Laboratory. Mr. Selvey spoke of the higher calorific value of coal, but manufacturers were not much inclined to value of coal, but manufacturers were not much inclined to depart from the older method which employed a lower calorific value. Some pronouncement was wanted on the exact number of B.TH.U. in a kw.-hour. Marks and Davis put it at 3,415. Some of the engineering year-books gave it as high as 3,420, and manufacturers varied from 3,411 to 3,415. When considering tenders the difference in these figures had its effect in getting at a fair comparison. They had found that the rotary air pump performed its work very well, but some forms took too long to create the vacuum in the condenser at starting. Where steam or water ejectors were employed this trouble was greatly reduced. The figure of 1.3 lb. of air per 1,000 lb. of steam was much too high. An air pump capable of handling that quantity of air and yet only being called upon to deal with about 0.4 lb. per 1,000 lb. was wasting power continually. The better arrangement was to put in two sets of air pumps, each capable of dealing with 0.5 lb. per 1,000 lb. and run only one under normal conditions, the other being brought into service when there was excessive air leakage or brought into service when there was excessive air leakage or when there was something wrong with the first one. The temperature of the sealing water to these rotary air pumps should be kept down, as this had a bearing on the power taken to drive them. On the question of the size of surface conshould be kept down, as this had a bearing on the power taken to drive them. On the question of the size of surface condensers, to allow one square foot of surface for every 5 lb. of steam seemed to him on the high side. Even with high inlet cooling water temperature, where k had to be run up, 1 sq. ft. to 6 lb. should be enough, and on jobs where the inlet cooling water temperature might be as low as 50° F., 7½ lb. ought to be condensed per sq. ft. The coefficient of heat transmission referred to as k would repay study. It ought never to be referred to unless the whole application of this factor was thoroughly understood. For instance, it might be as low as 500 and as high as 1,000 b.Th.U., and it depended upon local conditions; and the correct k for one job was probably quite wrong for the next. The tendency, however, when the cooling surface was not specified, was to keep that down, working with high k brought about by high velocity of the cooling water through the tubes. In plant running on a good load factor this might mean very high pumping costs, and as a rule it generally paid to buy more surface and keep down the friction head against the pumps.

Mr. D. A. Starr (Glasgow) thought that high efficiency was

down the friction head against the pumps.

Mr. D. A. Starr (Glasgow) thought that high efficiency was sometimes obtained at the expense of good mechanical construction, and good efficiency could be obtained sometimes with more rugged construction and better clearance between running parts, etc. No matter how carefully the testing was carried out, the main thing was the economical operation of the plant afterwards, and he thought it was important to watch results very carefully from the coal to the output of the station. In many undertakings the class of fuel varied, not only in calorific value but in size and quality also, and if careful analysis was made and the size of coal kept account of week after week, in conjunction with the load factor of the station, the output and the relative demand on the sizes of units in commission, as well as the lb. of coal per unit sent out, and the cost per ton of each class would indicate in the cost per unit whether the plant was keeping within its test conditions.

conditions.

Mr. J. K. Stothert (Glasgow) emphasised the need for experienced and expert observers. Unless the methods for naking the various measurements required in boiler trials were standardised and of calculating efficiencies were on the same basis, the results, apart from the accuracy of observations, were bound to be different and possibly misleading. He thought that the report of the Committee of the Institution of Civil Engineers on tabulating the results of steam engine and boiler trials recently published, if adhered to by engineers, would tend to attain the object which the author had in view. The author attached too much importance to the value of the CO₂ measurements, which might be used to cause a waste of money instead of the saving counted on. As a matter of practice, the cost of evaporating 1,000 gallons was the best test, and the CO₂ records were a guide-to help them to attain the result. There was a good deal to be said for the author's desire for specially designed furnaces for each class of fuel, but he was afraid that this was ideal. Manufacturers had to aim at an average plant, and he had often known cases of specially designed furnaces for a particular class of fuel which had proved a disadvantage to steam Mr. J. K. Stothert (Glasgow) emphasised the need for cular class of fuel which had proved a disadvantage to steam raising when the particular kind of coal was unavailable.

In the course of his reply, Mr. Selvey said that he found it took six months to tune up a plant, and, personally, he would

it took six months to tune up a plant, and, personally, he would not advise testing until that period had elapsed. A matter of 3 per cent, reduction in efficiency was not likely to occur on large sets, but it certainly occurred a great deal upon some of the smaller power station sets, and it arose very often through running with too fine clearances. There were many pitfalls in testing, and people seldom got within 2 to 4 per cent. He had not been pleading for a very high CO₂, but he thought 6 per cent, was upon the low side and ought to be improved. A very high CO₂ in the absence of complete knowledge had often led to extraordinary results. The question about K was rather a subtle one, and there was no doubt generally that they were returning to a reasonable water velocity and consequently a returning to a reasonable water velocity and consequently a norre reasonable pump power. A furnace was usually specially designed for a poor class of coal, and there was no difficulty in running in a better class of fuel. He was recently testing a new gas engine, of which the makers wanted to know the lower calorific value. He spent six weeks in trying to find that out, and he had great pleasure in telling them that there was no such thing. He consulted twenty-two authorities and text-books, and the ultimate conclusion he came to was that there was complete disagreement, while as to the value of the B.TH.U. per KW.-hour he would say it was 3,413.7.

# THE POWER SUPPLY OF THE CENTRAL MINING-RAND MINES GROUP.

By J. H. RIDER, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, April 15th, 1915.)

## (Continued from page 636.)

In 1913 a new type of control apparatus was suggested by the South African General Electrical Company (G.E. Co., of America). The general arrangement of this apparatus is as follows

(1) Electrically-operated contactor switches are used for the stator circuits, similar to those now working on several 3-phase winders on mines of the group.

(2) The rotor resistance is of the metallic type, the various sections being cut in and out by a series of nine 3-pole electrically-operated contactor switches.

(3) The operation of the stator and rotor contactor switches is effected by a small master controller of the cylindrical type mounted on the driver's platform. The controller lever moves in a similar manner to the ordinary operating lever.

(4) The rate of accelerating the speed of the motor is automatically controlled by a relay system in the rotor circuit, so that, although the control lever may be put right over at the start, no succeeding rotor switch closes until the rotor current, which has increased on the closing of the preceding rotor switch, has fallen to a predetermined and adjustable amount.

The advantages claimed for this method of control were: (a) No heavy work is imposed on the driver in operating the

control lever.

(b) No energy is wasted in continually pumping electrolyte.

(c) The full speed of the motor is obtained, as, when the last rotor switch closes, the rotor is metallically short-circuited.

(d) No energy is wasted in the rotor resistance during the period of full-speed running, but only during the periods of acceleration and retardation.

(e) There is no possible risk of flashing over, however quickly the control lever is operated.

(f) There is no cooling pipe system to be kept clean and in order.

The equipment was erected in the winding engine-room at the Village Main Reef, Ltd., and was used with great success for several weeks, during which time the drivers expressed themselves as being very well satisfied with it. Several defects in the apparatus appeared, however, as follows:—

(1) The control gear was mounted on a pipe framework on the light wooden floor of the engine-room. The continual opening and closing of the contactors shook the bolts loose, and it was soon seen that the mounting was too light and should be on a solid floor.

(2) The rotor resistance was formed of metallic grids, built up in frames like an ordinary trainear resistance. These frames were arranged in a metal tank filled with water to keep down the temperature. The water and the electrolytic action gradually destroyed the insulation between the grid sections, and affected the cable contacts on the grids.

Apart from these defects the general working was so satisfactory that it was decided to re-erect the control gear on a solid framework and foundations in a small house outside the engine-room, and to use, instead of cast-iron grids under water, a series of air-cooled rods or tubes for the main portion of the rotor resistance and three iron plates in water for the remainder. Several experiments were made to ascertain the correct size and lengths of the rods, and the whole arrangement as completed now appears to be quite sound and effective. The gear is illustrated in figs. 2 and 3.

Fig. 2 shows the stator contactor switches and fig. 3 the rotor contactor switches. It is in successful daily operation at the Village Main Reef G. M. Company. Ltd. Although a little more expensive in prime cost than the ordinary type of liquid control, this is more than repaid by the effectiveness and the saving of the heavy losses in the rotor resistance duration. ing the times of full-speed running.

With a view to obtaining competitive arrangements, the author, in July, 1914, sent particulars of the contactor-relay system of control to a British firm which claims to be expert in that class of work. It took nearly five months for a reply, other than an acknowledgment, to be received, and then the information sent was entirely useless. Wake up, England!

Electrically-operated contactor switches for the stator circuits are used with great success on several 3-phase winders of the group. The contacts are self-cleaning and are broken under a magnetic blow-out, and the maintenance is exceedingly small when compared with the ordinary pattern of oil switch. A contactor switch is shown in fig. 4, from which its essential parts will be seen.

Manufacturers do not seem to realise the nature of the duties which winder oil-break switches have to perform, and they usually supply the ordinary switchboard type. While the latter is only called upon to open and close feeder or machine

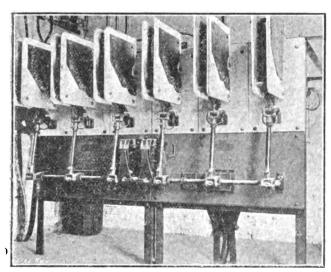

FIG. 2.—STATOR CONTACTOR SWITCHES.

circuits occasionally, and generally with no load on at the time, switches for 3-phase winders frequently have to make and break circuits from 500 to 1,000 times per day, and the breaking is usually done under full load. It requires a very substantial switch to stand up to this sort of work, and the arcing contacts and the oil have to be renewed at least once a week. This is a very "messy" and expensive job, and contactor switches are being insisted upon for all future 3-phase winders. On a 3-phase winder at Rose Deep, Ltd., these switches have made and broken the stator circuits over 388,000 times without any cost whatsoever for repairs or maintenance.

The deeper the shaft the cheaper is the 3-phase system compared with the Ward Leonard, particularly if the contactor system of rotor control is used, because with the latter the resistance losses are entirely eliminated at full speed. With balanced (double-drum) winders working without a tail rope, there is, however, a limit to the depth at which a 3-phase

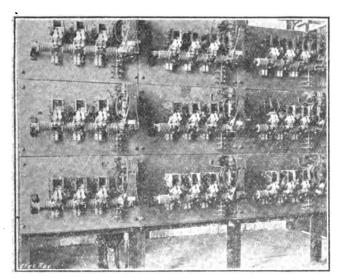

Fig. 3.—Rotor Contactor Switches.

winder is the more economical, because the weight of the descending rope ultimately overbalances the weight of the ascending load and reverse current has to be applied to prevent the winder running away. Such energy has to be paid for, but with the Ward Leonard winder the greater part of the breaking energy can be returned to the line. There is therefore not only the saving of a loss, but a distinct gain to be made.

For a winder which is frequently or constantly used for lowering loads, such as men or material, or, in some cases of inclined shafts, lowering rock to a point where it can be better raised by a vertical shaft winder, the Ward Leonard system is much to be preferred.

It is only by drawing out a diagram for each individual case

that a proper decision can be made as to which type of winder is the correct one to employ.

One advantage which the 3-phase winder has over the Ward Leonard is that geared motors running at 375 R.P.M., or at higher speeds, can be most conveniently employed in the majority of cases, which not only means a much cheaper equipment, but a better and more economical motor than if a

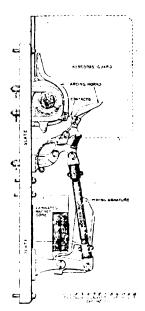

FIG. 4.—ELECTRICALLY-OPERATED CONTACTOR SWITCH.

direct-coupled one were used. With the Ward Leonard system a direct-coupled low-speed motor, although more expensive, gives a better working machine.

Most of the so-called overwinding accidents which have occurred on the Rand have been caused, not by any failure to stop the skip, but by starting the winder in the wrong direction when one skip is at the tipping point. In such cases the skip is pulled into the headgear sheaves before the winder drum has made half a turn.

Overwinding devices which cut off the supply of energy

Overwinding devices which cut off the supply of energy when the skip has reached a pre-determined point are not of much use for avoiding such accidents, because the driver must retain full command of the winder, in whatever position the skip is, to be able to bring the skip to the exact tipping point. This operation frequently calls for slight movements of the winder after it has first been stopped.

In 1912 the author's attention was directed to an electrical

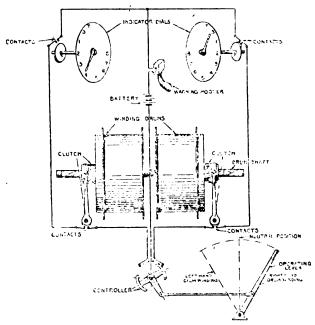

Fig. 5.—Diagram of Philip's Indicating Device.

device in use on certain winding engines at the Simmer and Jack East mine, near Johannesburg, the invention of Mr. W. Philip, the resident engineer, which, it was claimed, would give unmistakable warning to the driver if he attempted to start the winder in the wrong direction with the skip in the tip, without in any way taking away from him the full command of the winder. On investigation this claim was found to be fully justified, and since that date the whole of the

Digitized by GOOGLE

winders on the mines of the group have been fitted with the Philip device. The action is as follows:—

A 2-way controller switch is connected to the driver's operating lever, so that the contacts are open when the lever is in the neutral or "off" position. A slight motion of the lever in either direction closes the contacts on one side or the other. An insulated disk, with a short metallic insertion on the edge, is fixed on the spindle of each depth indicator dial, with two contacts arranged so that the circuit is closed when the depth indicator shows the skip to be anywhere in the region between the headgear sheaves and, say, 150 ft. below region between the headgear sheaves and, say, 150 ft. below the collar of the shaft.

A battery and a loud warning hooter complete the apparatus, which is connected up as shown in fig. 5. In the case of winders with loose drums operated through clutches (a great many of these winders are in use on the Rand to wind from different levels) an auxiliary contact is provided which is broken when the clutch is open and the brakes are holding that drum.

that drum.

By following through the connections it will be seen that when a skip is within what may be called the "danger zone" the smallest movement of the operating lever in the direction to raise the skip will sound the hooter, which is placed close to the driver. He is at once warned, and unless he has deliberately put his lever into that position he quickly pulls it back before any damage has been done. He can only raise the skip within the danger zone with the full knowledge of what he is doing, and he is also warned by the hooter if he keeps the power on past the pre-determined point in the shaft. This simple apparatus has already been the means of preventing a great many accidents.

#### (To be continued.)

## DISCUSSION AT MANCHESTER.

Mr. S. J. Watson said it was difficult to understand why the power plant load factor should be about 75 per cent. whilst the load factor of the air system was only 30 per cent. The 75 per cent. load factor indicated that some of the processes were working right through the 24 hours, and presumably the processes employing air compressors were only used part time.

Mr. A. E. Mackenzie said the author had uttered a word of warning, which some engineers present would perhaps have

warning, which some engineers present would perhaps have to take to heart during the next few years, in stating that it to take to heart during the next few years, in stating that it was only courting failure to attempt to give a permanent and reliable supply without a proper reserve of generating and transforming plant. Many central station engineers in this country would be pleased indeed to have the reserve of 25 per cent. which the author considered essential for a large supply like the Rand. It was difficult to understand why the power company stipulated in their agreement a possible frequency variation of 10 per cent.; such a variation would not be good enough for a Lancashire cotton mill owner, and considering a 75 per cent load factor and the serious trouble encountered by the author with stamps and speed of rotary mills, it would appear that this variation was frequently obtained. The expense of three meters was warranted in view of the immense power to be metered. It would appear advantageous to have each series of three composed of different types, preferably with different characteristics. The author stated, "It is a very common and erroneous practice to install oil switches without considering the volts that they may be called upon to deal with." In justice to engineers in this country, the author should substitute "was" instead of "is," as this feature had been generally recognised in this country for a long time. Regarding a switchboard maker's guarantee as to the maximum kw. which could be safely broken at normal voltage, the speaker would not place the slightest reliance upon such a guarantee.

Mr. Alcock was much impressed by the permissible pressure variation of 10 per cent. up or down, especially having regard to the necessity of uniform speeds in certain operations. It would be interesting to consider how far this power supply would have been countercially feasible if in the first place the power company had been compelled to deliver energy under the rather restricted variations prescribed by the Board of Trade.

Mr. W. H. Lea, who returned from the Rand about nine was only courting failure to attempt to give a permanent and

the rather restricted variations produced by the speaker was four tons, against the modern eight tons. The suggestion had been made some years ago, expressed his surprise at the phenomenal change in plant which had taken place since he left. The weights of the stamps ten years ago varied from 750 to 1.250 lb., whereas to-day they were 2.000 lb. Again, the heaviest skip load encountered by the speaker was four tons, against the modern eight tons. The suggestion had been made some years ago to employ taner ropes having a ton diameter of about 2 in. eight tons. The suggestion had been made some years ago to employ taper ropes having a ton diameter of about 2 in, and bottom diameter about 4 in.; had this been developed? The idea of placing the crushers at right angles to each other was quite novel and good.

Mr. Cramp asked why, both in the present paper and that read by Mr. Sparks, nearly the whole of the mining machinery appeared to have been obtained anywhere but in this country. If the motors centrifued nums, and compressors were better

anpeared to have been obtained anywhere but in this country. If the motors, centrifugal pumps, and compressors were better designed and better made abroad, the sconer this was realised the better; if such was not the case, what was the reason for so little of the machinery being made here? It was clear that recently some of the switches had not been made abroad, and it was only fair to the English that the point should be emphasised. If it were simply a question of price, that was

another matter. Regarding the control of winding machinery, the cascade motor had not been mentioned, but nevertheless was worthy of consideration. Instead of wasting the energy absorbed in the rotor resistance, the intermediate system might be adopted, whereby the rotor currents were led to a small polyphase motor which would make use of the energy so provided to drive additional machinery. This system had been successfully adopted in mining in this country. In any case it was more efficient than the plain polyphase system, and actually was about a mean in cost and efficiency between the plain polyphase system and the Ward Leonard control. The author's use of the term "root mean square" was not clear.

The AUTHOR, in reply, said that under the agreement with the power company the Rand Mines group took the whole of their power from the company. Steam plant was entirely scrapped. The price paid was 0.525d. per unit, but with certain discounts dependent upon the carriage on coal, etc., the net price came down in round figures to 0.5d. The air unit was paid for at the same figure. Regarding the large difference between the load factors for electricity supply and air supply, the reduction operations the cascade motor had not been mentioned, but nevertheless

for electricity supply and air supply, the reduction operations on the mines continued uninterruptedly except for a few hours a month to clean up. The only variable electrical load was the winding, the pump load and everything else was constant. If the winders were removed, the load factor would increase from 75 per cent. to 98 per cent. The air load factor, on the other hands of the contraction of the other contractions are the contractions of the contraction of the other contractions. winding, the pump load and everything else was constant. If the winders were removed, the load factor would increase from 75 per cent. to 98 per cent. The air load factor, on the other hand, was low on account of the drilling, which could not be a continuous operation. The drilling was done on a single shift, and generally finished about one or two o'clock in the day. The hole was then charged and blasted. Some mines had two drilling shifts, one day and one night shift, which improved the load factor, but it could never be as good as the electrical load factor because of the time occupied in charging, blasting, and clearing away the rock. The gate meter was certainly better than the Venturi, and anyone interested in air meters should consult Mr. Hodgson, who was an expert on such matters. Contrary to Mr. Alcock's assertion, pressure variations did not affect the speed, this being governed by the frequency. The transformers used by the power company were oil cooled, with a natural air draught coming in from outside. The question of taper ropes raised by Mr. Lea brought up an old story and an important point. The depth from which a winder could draw rock was dependent upon the rope, and if carried to extreme depth the rope alone would represent the full load without any addition. This point led to the suggestion and trial of the taper popes referred to by Mr. Lea, but they were quickly given up. The author had no actual report of the reason of failure, but suggested that difficulties were experienced in working such ropes on the drums. The existing ropes were 2 in. in diameter, and the greatest depth of any winder was 4.144 ft. There was another reason besides that of the rope which determined whether one or two winders should be used, one winder being at a lower stage. A deep shaft of, say, 5,000 ft., using only one winder would produce 5 to 8 tons at one operation, and with the winder going at 2,500 ft. per minute would take 2 minutes to get the rock to the top. If another winder were installed half way down, s on a price basis. Lately, however, matters were altered and the price question had been largely eliminated in favour of quality. Reliability was the first demand, and efficiency to the purchaser meant something which would always run and give no trouble with ordinary attention. Balanced three-phase meters were used throughout, as the loads, except in the case of a few odd circuits, were balanced. There were no three-phase cascade motors on the Rand group, and the author did not feel disposed to go out of his way to adopt them. If a plain three-phase winder was unsuitable, the Ward Leonard type would be installed. The formula for the air meter had been recommended to the displacement meter. The size of the orifice should be about 2 in., which could be made within reasonable limits, say, 1 in up or down. It could be used without objection if it came within those limits. There was no apparent reason why rope-driving should not be used was no apparent reason why rope-driving should not be used other than the enormous amount of space occupied by the rope drive. It was much cheaper and better in every respect to install high-speed compressors. The author had no figures regarding air losses in pipes, but emphasised the importance of maintaining a good air pressure at the drills. The definition "root mean square" was not, perhaps, a scientific expression but its meaning any advisory in the true approximation to the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract tion root mean square was not, perhaps, a scientific expression, but its meaning was obvious: it was the true average horse-power which the plant was called upon to do. The term was in common use on the Rand, and if it were stated that a winder had a root-mean-square power of 2,000, it meant that in starting the machine might have to develop 4,000 H.r. for a short time. short time.

# THE RHEOSTATIC CONTROL OF SEPARATELY EXCITED GENERATORS.*

#### By L. BOOTHMAN.

THE use of a main field rheostat in conjunction with an exciter field rheostat is in some cases necessary, particularly where the voltage of the exciter circuit must be kept perfectly constant-for instance, where the exciter is also being used for lighting purposes; but in most cases the main field rheostat can be dispensed with entirely and the whole regulation obtained by the exciter field rheostat alone. The resultant saving in first cost, the saving of a continual larger watt loss due to a main field rheostat, and the saving in space, together with the increased simplicity of a single rheostat, make the use of such a method of control worthy of consideration. Such rheostats, however, must have a large number of steps of resistance in order to compensate for the following variable factors:—

The forms of two curves are required to be known for stepping out the rheostat resistance, namely, the load saturation curve of the generator and that of the exciter. These curves are usually calculated or are taken from tests of similar machines, and in either case some variation is to be expected, due to natural differences in material and differences in reluctance of the joints in the magnetic circuit.

Again, there is approximately twenty per cent, resistance variation in both machine fields from the cold to the final temperature when running, thereby displacing by a proportionate amount, during this period, the working position of the exciter field rheostat.

A further variation may be produced if an alteration in speed occurs, especially at low loads, if the exciter saturation curve approximates a straight line form at this position. This, of course, raises or lowers the terminal voltage of the generator an sympathy with the alteration in speed.

Fig. 1.—Type "MBR" Field Rheostat giving 280 to 308 Steps.

Displacement of the commutating brushes of the exciter from the correct or neutral position, particularly if the machine has interpoles, affects the shape of its load saturation curve with a consequent derangement of the stepping of the rheostat resistances.

Where an alternator is designed for a certain power-factor and is run on a load with a different power-factor, the necessary range of exciter voltage is changed. For example, when running on a load with a lower power-factor, a larger amount of resistance is required in the working range of the exciter rheostat.

The rheostat must have a sufficient number of steps to ensure that the permissible variation of generator voltage on load is not exceeded, also, the total ohmic resistance must be sufficient to obtain the lowest generator voltage required at no-load.

The conclusion derived from the above considerations is that an evenly divided resistance in the exciter rheostat is the best proposition in order to cover all the above points.

The usual exciter field rheostats now on the market, with about one hundred to one hundred and twenty-five steps maximum, have not a sufficient number of steps to render this proposition possible. If it were attempted to carry it out on them the regulation on the working range would be too "coarse," i.e., there would be too much resistance between each step. In these rheostats, therefore, relatively large steps of resistance are inserted from the "all out" position up to where the estimated working range is reached, and comup to where the estimated working range is reached, and comparatively small steps of resistance are inserted over the working range, with a few large steps at the no-load end to allow some margin.

of some margin.

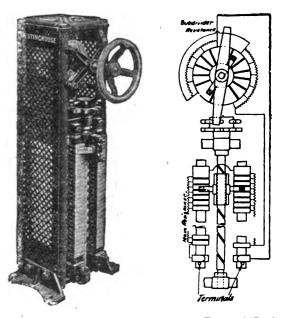

What is needed therefore is a rheostat of reasonable dimensions and cost, and with a large enough number of steps to allow of the resistance being stepped out evenly over the whole range. Rheostats which fulfil these conditions have been developed and patented by the British Westinghouse Co., and are shown in figs. 1 and 2. These rheostats, by means of a novel contrivance, give a large number of steps, and at the same time occupy about the same, or less, space than the usual form of exciter field rheostat. They are made in two types, viz.: a "straight" pattern designated MB. St. type with five hundred to five hundred and fifty steps, and a smaller round pattern designated MBR type, with two hundred and eighty to three hundred and eight steps.

The operation of both types is practically the same, and will

The operation of both types is practically the same, and will be readily understood from an explanation of the type MB. St., which is illustrated in fig. 2.

This rheostat consists essentially of two rheostats connected in series, as shown in the diagram, the whole of the resistance of one rheostat called the "subdivider" being equivalent to one step of what is termed the "main" rheostat, which in this type is the straight portion.

By revolving the operating hand-wheel half a revolution in one direction, the ten steps of the subdivider resistance are cut out, and a slight further movement in the same direction puts the whole subdivider again in circuit. Simultaneously with the latter movement the equivalent resistance of one step is cut out of the main rheostat resistance. This is accomplished by means of the double arm, shown in fig. 3, which engages with and revolves the capstan fixed to the quick traverse screw which moves the brush of the main rheostat.

3.—Illustration and Diagram of Type "MB. St." Field Rheostat giving 500 to 550 Steps. Figs. 2 & 3.-

It will be seen, therefore, that each main step of resistance is sub-divided and is cut out in ten steps every time the handwheel is rotated half a revolution in the one direction; the action is similar when putting resistance in.

There are in this type fifty steps in the straight portion and ten in the subdivider, thus obtaining, with twenty-five revolutions of the hand-wheel, five hundred steps from the "all in" to the "all out" position.

to the "all out" position.

If the total subdivider resistance is arranged to be only tenelevenths of the resistance of one main step instead of equal to it, then the eleventh part will be cut "in" or "out" as the case may be, during the transition stage of "balancing," and thus a total of 11 × 50 = 550 steps will be obtained.

As before stated, the type "MBR" rheostat operates in a similar manner to the type "MBSt." just described. In this case, however, the double arm, instead of moving a capstan which actuates a quick moving thread carrying a brush actuates a toothed wheel which in turn moves, by means of a pinion and gear wheel, a contact arm fitted to an extension of the gear wheel.

The type "MB. St." rheostat is built up of metal and mica throughout and has laminated contact brushes. The resist-

throughout and has laminated contact brushes. The resistance units are mounted directly on to the stems of the contacts, which is a valuable feature, as it avoids any inter-

mediate loose leads between the contacts and resistances.

The latter feature also applies to the type "MBR"; in this case, however, the contacts are mounted on a slate panel.

Both of these rheostats should have a large market in their respective spheres, as they are undoubtedly devices which have been needed for a long time.

^{*} From the British Westinghouse Gazette.

## PUBLICITY-THE SOUL OF BUSINESS.

BY E. P. BENNETT.

"Thousands of pounds wasted daily!" A statement of considerable force, nevertheless it is one that may be equally well applied, and with as much truth, to catalogues and advertising matter generally, as to the waste-paper disposed of each day by the destructor.

of each day by the destructor.

The present age is one of catalogues, for to-day every firm, large or small, issues lists, from the bulky volume of the manufacturer to the schedule of prices of the retail man. These catalogues are scattered broadcast in vast quantities every year by post, rail, or contract carrier. Some are issued upon elaborate systems, cleverly thought out in every detail, and seldom fail to reach the right quarter, inevitably repaying the enterprising concern or individual in whose interests they have been compiled, while others—and these the great majority—are foredconned to failure. great majority-are foredoomed to failure.

For the purpose of classification, it would be interesting to separate the firms issuing these lists into three classes, viz.:

(1) The concern which scientifically compiles, produces, and distributes.

(2) The concern which scientifically compiles and produces, but fails in the distribution.

(3) The concern which merely commits so much matter to paper, and leaves chance to be responsible for the distribution. The results are probably in the same ratio to the cost of

production. Consider these three sections in detail, taking for the first a manufacturing company with a number of wholesale dis-

trict branches.

trict branches.

At the headquarters of the company there is most probably a department—not necessarily large—exclusively devoted to publicity work. This department would be in close touch with the works manager, and working in concord with the organising secretary, the former regulating the prime costs and output of material, the latter stipulating the profits to be derived. The works manager would also be responsible for the quality of the material being up to the standard of competitive makers, the organising secretary being responsible for the ultimate prices being fixed strictly in line with the market's ruling figures.

ruling figures.

In this way, all likely demands on the factory could be

In this way, all likely demands on the factory could be promptly met and precipitate advertising avoided, and buyers would invariably find the catalogues of interest and real value, owing to the absence of enhanced or erroneous prices of general market requirements.

So far, it will be observed that the works, organising secretary, and the publicity department, have been in close touch with one another; but from now the publicity department have the matter entirely in their own hands. All details of production, arrangement of descriptive matter, illustrations, and printing, which to adequately describe would require the and printing, which to adequately describe would require the pen of a publicity expert, are left to them, and the whole undertaking proceeding rapidly under their supervision—a most important point in the issue of any big list, if it is to be of maximum service—the completed publication is soon ready for distribution ready for distribution.

Advance copies are sent to the respective heads of the departments and branch managers, immediately followed up by a small quantity being sent to each branch, and the general distribution then commences. This distribution is started immediately prior to the appearance of the trade Press notices, and should preferably be taken charge of by a supervisor in the publicity department, who has an intimate knowledge of the various clients, and proceeds in the following order:—

(1) Covergment departments, public hodies, and corporate

(1) Government departments, public bodies, and corporations.

- (2) Concerns on the ledger with current accounts (and here the supervisor's duties are to eliminate the casual or chance account to which a general list could be of little service).
  - (3) Prospective clients.

(4) Consulting engineers, works managers, and chief draughtsmen.

The latter could use the production with advantage when

The latter could use the production with advantage when making requisitions upon their own purchasing departments, and in the case of consulting engineers, the publication could be of use in connection with their specified material.

Distribution 3 and 4 would be most effectively carried out by the branches, where managers and travellers are in touch with the more important men and departments, who could not so surely be reached by post or other delivery methods.

Where a company has overseas establishments, the lists are sent in bulk to the colonial or foreign offices, and the distribution is carried out on similar lines, under the direct super-

bution is carried out on similar lines, under the direct super-

bution is carried out on similar lines, under the direct supervision of the local manager or agent.

The entire system is indexed on a card file, kept up to date by constant revision, particulars of which are sent in at frequent intervals from all branches and the counting-house.

When applications for lists are sent in direct, as the result of Press notices or advertisements, these are indexed in a similar way, and the branch concerned is immediately notified. These applications in connection with any big lists or publications are confirmed by the branch before despatch. Thus tions are confirmed by the branch before despatch.

waste is avoided, and it is reasonably certain that the catalogues are not being sent to any undesirable individuals or firms. By this system, losses are reduced to a minimum, returns through faulty despatch are negligible, and the issue is consumed in the best directions, and, above all, no waste is encountered by quantities of the lists being hoarded and eventually destroyed, owing to their becoming out of date.

Three-quarters of the complete issue thus dispersed of the

Three-quarters of the complete issue thus disposed of, the remaining portion is left for distribution against subsequent demands from the head office or the branches.

For Section 2, a similar company might be illustrated, which, though possessing a department fully capable of producing a catalogue equal in every respect to that of the firm just considered gives that department no control over the distribution. or, again, specialising only in production, lacks the initiative or interest necessary for successful distribution. In this case, the work is left largely to the efforts of the jumor members of the staff, who, without the help of an adequate system, invariably fail in securing the desired results.

The issue is made before the works are in a position to supply, and the departmental heads are often left to learn from outside sources that a new list is being circulated.

from outside sources that a new list is being circulated.

Press notices are frequently overlooked, and it is certain that numerous individuals secure a copy of an expensive list which is of no possible value to them. Returns are plentiful, owing to inaccurate addressing, and in all probability the "official" distribution is considered complete with a large supply of the lists still available. Upon their gradually becoming obsolete, they are finally destroyed to make room for new publications. It would be impossible to obtain an accurate estimate of the resultant loss, for, in addition to the production expenses and the cost of the faulty distribution, there is the more important factor of orders lost which might otherwise have been secured. wise have been secured.

Take for Section 3 concerns well known to almost everyone,

Take for Section 3 concerns well known to almost everyone, because they are so numerous. Collectively, they produce vast quantities of printed matter, which can hardly be described by any other term. True, the issue may be bound in a cover of striking colour, but should a buyer secure a copy by any means, it is immediately recognised as of no value or interest, and is therefore rapidly shelved, its very colour denoting that it is the one catalogue amongst all others to be avoided.

avoided

avoided.

It is in this section that the waste is most pronounced. No correct calculations of requirements are made, and to avoid shortage, excess quantities are ordered, which soon accumulate to alarming dimensions, and either for lack of accommodation, or for fear of becoming obsolete, must be sent out broadcast.

Outlets must be found, and the branches, wholesale houses, and clients, are asked to share in the work of distribution. Lists are unloaded in bulk upon these distributors, to again lie idle and untouched, for the reason that the branches are fully aware that the catalogues are unattractive or obsolete. The wholesale houses find more remunerative lines to which to give publicity, and the client, through lack of enterprise, fails to see that he might make some use of the lists to help the returns of his own retail business.

returns of his own retail business.

Having briefly surveyed the three sections, the matter can be summed up as follows:—If to-day "Publicity is the soul of business," then that publicity must be of a high order of intelligence, so arranged and produced that all unnecessary trouble on the part of the buyer is avoided; descriptive matter must be short and decisive, clearly illustrated, and in form easy to handle, with every facility afforded for ready reference to particular sections, and, above all, there must be constant revision to keep the whole production up-to-date.

Such matter will give the firm concerned a high standard amongst the buying fraternity and, with prompt dispatch, will reflect on the capabilities of its organisation, creating a force-

reflect on the capabilities of its organisation, creating a force-ful influence and compelling an ever-increasing business, turn-ing waste into profit, and ensuring success and dividends where there is now one continued struggle for mere existence.

# FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AUSTRALIA.-H.M. Trade Commissioner in Australia has recently forwarded to the Board of Trade an extract from a letter which he has received from a firm in Melbourne. letter which he has received from a firm in Melbourne, complaining that British firms do not always comply carefully with the regulations regarding certificates of origin for entry under the British Preferential Tariff. The extract reads as follows:—
"We have recently received more than one invoice bearing on the back certificates which are inaccurately worded or signed with a rubber stamp. In such cases we have had to deposit the money and get fresh invoices from the manufacturers. It is surprising to us, as it doubtless is to you, that a large firm of British manufacturers should consider a rubber stamp signature sufficient for such a declaration as is necessary to satisfy the Commonwealth Customs. We bring these matters under your notice, thinking you may deem it worth matters under your notice, thinking you may deem it worth while to mention them in your advices to the Board of Trade

with a view to manufacturers being warned as to the correct form of declaration to be used, and also as to the necessity for such declaration being properly signed and witnessed."

GOLD COAST.—The Government of the Gold Coast have recently passed an Act consolidating the Customs tariff of that Colony, to make one uniform tariff throughout the Colony in place of the former tariff applicable to parts of the Colony lying East or West respectively of the River Volta. The rates of duty leviable in that part of the Colony lying to the East of the River Volta were previously lower than those leviable on similar goods imported into that part of the Colony lying to the West of the River Volta. The rate on goods not specially mentioned in the tariff is now fixed at 10 per cent. al valorem (on the value of the goods at the port from which the goods were imported); this rate would be leviable on any electrical goods not exempt from duty. The following articles are permitted to be imported free of duty: Goods imported for the service of any Public Department in the Colony; apparatus and structural materials for telegraphs, telephones and electric lighting; appliances, apparatus, and materials imported exclusively for use in any process for the separation of metals from ores; cranes, derricks, and winches, whole or in parts, and machinery necessary for working the same; scientific instruments and appliances; electrical machinery, railway and tramway plant, material, and rolling stock.

NORWAY.—The following articles are now prohibited to

NORWAY.—The following articles are now prohibited to be exported from Norway: Copper, unwrought (except copper produced in Norway and accompanied by a certificate of origin); alloys of copper with common metals, unwrought; scrap of copper and copper alloys; wholly or partly manufactured wares of copper and alloys of copper with common metals, viz., plates and sheets, ribbons, rods, rolled or drawn wire, cup-shaped materials for the manufacture of cartridges; bolts, rivets, and nails; tubes and shaped pieces; wire twisted into ropes; cables without insulation fitted with mantle, armoured or unarmoured, also cables covered with insulating-materials of all kinds; and castings.

DENMARK—The following articles amongst others are

DENMARK.—The following articles, amongst others, are now prohibited to be exported: Ferro-manganese, ferro-molybdenum, ferro-nickel, ferro-titanium, ferro-tungsten, ferro-vanadium, graphite and graphite crucibles, manganese and manganese ore.

SWITZERLAND.—Exportation of the following goods has been prohibited as from April 24th: Iron and steel sheets of all kinds, including corrugated sheets and corrugated piping; piping of wrought iron and steel with an internal diameter of less than 40 cm.

BULGARIA.—Amongst a number of other articles whose exportation from Bulgaria is now prohibited are telegraph and telephone wires, copper of all sorts, tin, lead, and other metals, also raw copper and certain forms of metal from the Plakalnitze Mine.

MOROCCO.—The Resident-General of the French Zone in Morocco has prohibited the exportation and re-exportation (in process of transit, transhipment, or under the temporary importation regime) of, amongst other articles: Electrical apparatus; rubber in any form; celluloid; iron, steel, metals and ores; machines suitable for the manufacture of munitions of war or military arms.

# UTILISATION OF SOLAR ENERGY.

What was probably the most complete account yet published of work performed on the utilisation of solar energy was presented by Mr. A. S. E. Ackermann at a meeting of the Royal Society of Arts on April 28th. The author's work in Egypt with the Shuman-Boys absorber was described fully last year (see Electrical Review, April 24th, p. 722), and the present paper deals exhaustively with the methods and results of earlier workers. There is no doubt that the direct utilisation of solar energy is feasible; the only question is whether such utilisation is economically practicable. About 5,000 H.P. per acre is transmitted by the sun to the earth's surface at noon on a clear day, and it is said that the solar energy received on 120 square miles of the Sahara is equivalent to the whole world's coal and oil consumption. Of this enormous power only about 4½ per cent. was utilised by the Shuman-Boys plant; but it must be remembered that the efficiency of storage of solar energy by plant life—from which the whole of our coalfields have been derived—is nothing like so great. Further, the thermal efficiency of the Egyptian boilers was only 40 per cent., and it is reasonable to suppose that this can be increased materially as experience is gained in sun-boiler construction. Ericsson, nearly forty years ago, claimed 72.5 per cent. thermal efficiency for his sun-boilers, and so reliable has time proved his data on the solar constant that it would be well worth while investigating the present possibilities of the boilers that he used.

Appet from had luck in the way of purely mechanical defects

Apart from bad luck in the way of purely mechanical defects in the engines and pumps installed, the Shuman plant in Egypt was affected adversely by the low steam pressure employed. Two compromises have to be made. By adopting

higher steam pressure the engine efficiency is increased, but so is the loss from boiler radiation. Again, with small concentration and low boiler temperature, single or double cover glasses are required to reduce losses; but as concentration is increased, there comes a point at which the loss by reflection from a protected boiler equals the loss by radiation from a naked boiler, so that the cost and inconvenience of glass sheathing can then be avoided. Each sheet of glass involves a penetration absorption loss of about 15 per cent. On these grounds, said Prof. Boys, he was of opinion that greater concentration, and hence higher boiler temperature and pressure, should be employed in later absorbers of the Shuman type. From the Meadi plant nearly three-fourths of the brake horse-power theoretically possible was actually obtained (relative efficiency referred to Carnot cycle, 73.2 per cent.). The special type of Shuman engine developed for use with sun-absorbers consumes only 22 lb. per B.H.P.-hour of steam at atmospheric pressure, and, at 20-30 lb. per square inch, which seems to be the pressure range indicated by experience as most favourable, considerably better steam efficiency would be attainable. Pumps and condensers of such perfection are now available that there need be no appreciable wastage in using other vapours than steam, with water as the intermediate heating agent. The possibilities of two-fluid systems and of low-pressure turbines seem yet to have been very incompletely investigated.

Though heat is obtained "for nothing" in sun plants, the capital cost and depreciation of the latter are considerable. As the result of his 1913 investigations and subsequent experience with the Shuman engine, Mr. Ackermann concludes that the utilisation of solar energy is practically a solved problem "where there is plenty of sunshine and coal costs £3 10s. per ton." That statement takes full account of capital and depreciation charges, and it is assumed that silvered glass mirrors are used, since these are much more satisfactory in practice than metal reflectors. There is good reason to believe that considerably better results will be obtained in the next plant erected, and there seems nothing extravagant in the suggestion that solar heat will, in the near future, be equivalent to coal at £2 a ton. In many parts of the world coal is used regularly at this and higher prices, and it is a fortunate coincidence that where coal is dear, sunshine is often plentiful. Primarily, sun-power plant is best adapted to irrigation work, the availability of sun-heat and the necessity for irrigation being interdependent, but there is no reason to doubt that, once waste places of the earth, remote from coalfields and transport facilities, have been reclaimed by irrigation, the power and lighting requirements of the district can be supplied by solar-electric generation. In stimulating further research in this promising field and in preventing waste of time and labour in fruitless or already explored directions, Mr. Ackermann's latest paper should prove very useful.

# NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

A Dominion Government report giving statistics of the various telegraph systems operating in Canada has been issued recently.

There are twelve such systems, including those of the Marconi Wireless Telegraph Co. and the Dominion Government Telegraph Service, the latter operating in those outlying sections of the Dominion which are not served by commercial telegraph organisations.

The financial results of the working during 1914 have not been so good as they were in the previous year; the gross earnings (amounting to \$5,983,204 in 1914) being \$112,008 less and operating expenses \$208,059 more, making a total adverse difference of \$320,067; the operating expenses for 1914 were \$4,242,539.

By far the larger share of business goes to the system of the Canadian Pacific Railway Co., that of the Great North-Western Telegraph Co. coming next with only one-third of the C.P.R. Co.'s business; these two concerns together handle about two-thirds of the total telegraph business of the Dominion.

The items of operating showing the greatest increases are "line and equipment" and "buildings," followed by "salaries and wages" and "stationery and printing," in order of importance

importance..

Figures of pole and wire mileage are given, from which it is seen that the Province of Ontario leads, after which come Quebec, Saskatchewan, British Columbia, Alberta, Manitoba, and Nova Scotia. The ratio between pole mileage and wire mileage varies a good deal, from 1s. 6d. in Ontario to practically 1s. 3d. in Quebec; this is exclusive of the Yukon and Newfoundland, where the ratio is 1s. 1d., the conditions evidently being special. As a conductor, galvanised wire holds the first place, there being over 126,000 miles in use last year; next comes multiple, of which there were 43,000 odd miles, then copper, overhead, 21,600 miles, copper, underground, 737 miles, and copper, submarine, 653 miles.

#### INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

Darjeeling Hydro-Electric Scheme.-Mr. Stonebridge, one of Darjeeling Hydro-Electric Scheme.—Mr. Stonebridge, one of the partners of the electrical engineering firm, Messrs, Luke Stonebridge & Co., has been temporarily engaged by the Darjeeling Municipality to report further on the hydro-electric scheme on which the late Mr. Robertson was engaged when he was drowned. Originally, the two stations Lebing and Talapahar, and areas in between, were only to be provided with current, but in view of more extensive possibilities the temporary engineer is engaged in making observations and taking particulars in the Dam Dimma Valley, where it is conjectured several power-houses might be established and interlinked, so that sufficient power may be obtainable for the various tea gardens in the area right down to Nuxalbarie and Siliguri. so that sufficient power may be obtainable for the various tea gardens in the area right down to Nuxalbarie and Siliguri. It may not be outside the range of possibility to provide, at no distant date, sufficient cheap power to electrify the Darjeeling Himalayan Line. This is a 50-mile narrow-gauge line from Siliguri to Darjeeling, with an ascent of 8,000 ft. It now takes over seven hours to travel the zig-zag distance, and is not far off being one of the most expensive railway journeys in the Empire.

not tar off being one of the most expensive railway journeys in the Empire.

Cauvery Power Scheme.—Mr. A. G. Forbes, the chief electrical engineer, read a very interesting paper recently at the Mysore Engineers' Association, having for his subject the Cauvery Power Scheme. He went on to say that the fourth installation of 4,000 H.P. was almost completed; and this, with a similar installation proposed for next year's budget, would make over 20,000 H.P. generated from the Cauvery Falls. Since the first installation was put down several years ago the phenomenon of high-tension transmission has become of every-day use and hence the local problem of long-distance transmission has been made easy. Under a new agreement with the Kolar Mining Co., the Mysore Government are to supply them with 14,500 H.P. at the motor terminals—a distance of 92 miles away, with an option of 2,500 H.P. more on two years' notice being given. Mr. Forbes went on to say that as the Cauvery power scheme was the pioneer of its kind in India, the future of electrical development in this country was dependent on its unqualified success. He added that from an engineering and economic standpoint the Cauvery scheme was the most successful one in operation to-day.

## NEW PATENTS APPLIED FOR, 1915.

(NOT YET PUBLISHED).

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford.

5,832. "Process for the manufacture of heating-conductors for thermic telephones." NAAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE THERMO-TELE-PHOON MAATSCHAPPIJ. April 19th. (Convention date, February 6th, 1915, Germany.) (Complete.)

many.) (Complete.)

5,833. "Sound chamber for thermic telephones and the like intended to be introduced into the auditory passage." NAMMLOOZE VENNOOTSCHAF DE NEDERLANDSCHE THERMO-TELEPHOON MAATSCHAFPIJ. April 19th. (Convention date, February 8th, 1915, Germany.) (Complete.)

5,834. "Construction of heating-conductors for thermic telephones." NAMMLOOZE VENNOOTSCHAF DE NEDERLANDSCHE THERMO-TELEPHOON MAATSCHAFPIJ. April 19th. (Convention date, February 8th, 1915, Germany.) (Complete)

5,835. "Process for the manufacture of heating-conductors for thermic telephones." NAMMLOOZE VENNOOTSCHAF DE NEDERLANDSCHE THERMO-TELEPHOON MAATSCHAFPIJ. April 19th. (Convention date, February 9th, 1915, Germany.) (Complete.)

(Complete.)

5,836. "Thermic telephones." NAAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE THERMO-TELEPHOON MATSCHAPPI). April 19th. (Convention date, February 10th, 1915, Germany.) (Complete.)

5,837. "Thermic microphone." NAAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE THERMO-TELEPHOON MATSCHAPPIJ. April 19th. (Convention date, February 11th, 1915, Germany.) (Complete.)

5,838. "Thermic telephones." NAAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE THERMO-TELEPHOON MATSCHAPPIJ. April 19th. (Convention date, February 11th, 1915, Germany.) (Complete.)

5,839. "Thermic telephone with adjustable sound effect." Neuroccap

11th, 1915, Germany.) (Complete.)

5,839. "Thermic telephone with adjustable sound effect." Naamlooze Vennootschap de Nederlandsche Thermo-Telephone Maatschappij. April 19th. (Convention date, February 12th, 1915, Germany.) (Complete.)

5,840. "Thermic telephones." Naamlooze Vennootschap de Nederlandsche Thermo-Telephono Maatschappij. April 19th. (Convention date, February 12th, 1915, Germany.) (Complete.)

5,841. "Mounting for thermic telephones." Naamlooze Vennootschap de Nelerlandsche Thermo-Telephone Maatschappij. April 19th. (Convention date, February 12th, 1915, Germany.) (Complete.)

date, February 12th, 1915, Germany.) (Complete.)

5.842. "Heating-conductors for thermic telephones." Naamlooze Vennootschep de Nederlandsche Thermo Telephones." Naamlooze Vennootschep de Nederlandsche Thermo-Telephones." Naamlooze Vennootschep de Nederlandsche Thermo-Telephones." Naamlooze Vennootschep de Nederlandsche Thermo-Telephones." Naamlooze Vennootschep de Nederlandsche Thermo-Telephones Maatschappij. April 19th. (Convention date, March 6th, 1915, Germany.) (Complete.)

5.844. "Process for the manufacture of heating-conductors for thermic telephones." Naamlooze Vennootschep de Nederlandsche Thermo-Telephone Maatschappij. April 19th. (Convention date, March 6th, 1915, Germany.) (Complete.)

5.845. "Thermic telephones." NAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE. THERMO-TELEPHOON MAATSCHAPPIJ. April 19th. (Convention date, March 17th, 1915. Germany.) (Complete.)

5,846. "Thermic telephones." NAAMLOOEE VENNOOTSCHAP DE NEDERLANDECHE THEMO-TELEPHOON MAAISCHAPPIJ. April 19th. (Convention date, March 17th, 1915, Germany.) (Complete.)

5,847. "Thermic telephones." NAAMLOOZE VENNOOTSCHAP DE NEDERLANDSCHE THERMO-TELEPHOON MAATSCHAPPIJ. April 19th. (Convention date, March 17th, 1915, Germany.) (Complete.)

1915, Germany. (Complete.)
5.848. "Commutators." T. Zimmerman. April 19th. (Convention date, April 17th, 1914, United States.) (Complete.)
5.853. "High-speed rotating bodies." British Thomson-Houston Co., Ltd. April 19th. (General Electric Co., United States.)

5,865. "Ignition devices for starting internal-combustion engines." R. ROSCH (firm of). April 19th. (Convention date, April 17th, 1914, Germany.) (Complete.)

5.866. "Lanterns for electric lamps." R. Bosch (firm of). April 19th. (Convention date, June 15th, 1914, Germany.) (Complete.)

5.870. "Production of zinc or other metals by electrolysis." M. PERREUR-LLCVD. April 19th. (Addition to 4,625/15.) (Complete.)

5,875. "Portable telephone and telegraph instruments." INTI ELECTRIC Co., LTD., R. G. LE NOIR, and E. FUNCTUS. April 19th. INTERNATIONAL

5.879. "Combined electric switch and wall plug." W. H. STURGE. April 20th." 5,883. circuit." "Method of obtaining a sparkless break of an inductive electric T. F. Wall. April 20th.

" Electrical conductors." A. MARR & J. LISTER. April 20th. 5.887.

"Electric heating-element." CABLE ACCESSORIES Co., Ltd., & F. H. April 20th. (Complete.) 5,889. REEVES.

"Telephone call recorder." F. P. REID. April 20th. 5.909.

"Windings for electrical machines," British Thomson-Houston D. April 20th. (General Electric Co., United States.) 5,918. " Co., LTD.

"Process for the electro-deposition of zinc." S. O. COWPER-COLES April 20th.

5,936. "Solder." S. O. Cowper-Coles. April 20th.

5.937. "Process for the electrolytic coating of sheets and plates with other metals." S. O. Cowper-Coles. April 20th.

5.938. "Manufacture of electrolytically-coated metal plates." S. O. Cowfer-Coies. April 20th.
5.933. "Electric switches." G. Giles. April 20th. (Convention date, April 24th, 1914, Germany.) (Complete.)
5.955. "Polyphase generators for high-frequency currents with polyphase tuned spark gap." L. Rouzer. April 20th. (Addition to 519/15. Convention date April 20th, 1914, France.) (Complete.)
5.964. "Combined automatic electric taximeter. flags, and fare died illustration."

5,964. "Combined automatic electric taximeter, flag, and fare dial illuminator with reflector." G. S. Lysacht. April 21st.

5,969. "Thermostats." H. E. Moul. April 21st.

5.992. "Generator of mechanical and electrical power by different currents." D. Suchostawer. April 21st.
5.994. "Sound transmitter." C. STILLE. April 21st. (Complete.)
6.003. "Electro-magnetic driven pumps." E. BACHELET. April 21st.

6.055. "Lieuro-magnetic griven pumps." E. Dachellet. April 2151.
6.055. "Lamp-sockets and lamp-holders for incandescent electric lamps."
E. EDSER. April 22nd.
6.063. "Signalling or telegraph apparatus." R. H. Walker & J. J. Walker. April 22nd
6.066. "Separators or covers for the plates of secondary batteries." Electrical Power Storage Co., Ltd., & C. C. Rattey. April 22nd.

6.086. "System of control for maintaining the relative speeds of a number of electric motors." F. C. Anderson & C. A. Atchley. April 23rd. (F. G. Wardurton, Canada.)
6.093. "Lead jointing-sleeve for electric joints." C. J. Beaver & E. A. Claremont. April 23rd.

6,093. "Lead jointing-sieve for electric joints. C. J. BLAVER & E. ... CLAREMONT. April 23rd. 6,096. "Carriers for electric hand lamps." ASSOCIATED PORTLAND CEMENT MANUFACTURERS (1900), LTD., & C. P. TAYLOR. April 23rd. 6,098. "Electric generating set." A. COLLET. April 23rd. (Convention date, April 30th, 1914, France.) (Complete.)

6,117. "Electrical distribution apparatus." W. T. Henley's Telegraphi Works Co., Ltd., & E. E. Judge. April 23rd. 6,135. "Construction of insulated conductors for electrical purposes." J. l. Hall. April 24th. 6,151. "Magnetic brakes, clutches, and the like." F. Newton & Newton Brothers (Derby), Ltd. April 24th.

#### PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messes. W. P. Thompson & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

#### 1914.

136. ELECTRIC HEATER. J. R. Quain. January 2nd.
399. SUBMARINE TELEGRAPHY. J. S. Withers (Cox). January 6th.
3,221. ELECTRIC WATER-HEATERS OR GEYSEKS. J. R. Quain. February 6th.
(Cognate applications, 8,019/14 and 14,334/14.)
8,049. TELEPHONE TRANSMITTING APPARATUS. J. J. Comer. March 30th.
(March 31st, 1913.)
8,505. AUGLEUTE CARROUS. H. August 4.1.2.

8,505. ARC-LIGHT CARBONS. H. Ayrton. April 3rd. (Addition to 22,319/13.) 8,804. ELECTRIC WELDING! E. H. Jones and Light Steel Tubular Wheels. Ltd. April 7th.

Ltd. April 7th.

#### ELECTROSTATICS AND INDUSTRY.

THE property of an electrostatic field, whereby it tends to sweep up all suspended particles within it and deposit them on the charged surfaces, is a phenomenon with which we have been acquainted from a very early period; but little use has been made of it until comparatively recently. There are two principal ways in which it may be manifested. One is by the mimic hailstorm of small pellets of pith or other light material between two metal plates, due to the actual charging of the pellets by contact with one of the plates and their subsequent repulsion from it and attraction to the other plate; this is a familiar experiment of the entertainment order, but probably has little bearing upon industrial The other way is by the bombardment of electrons and ions due to the ionisation of the medium by the electric field, the floating particles being thus charged by the attachment or detachment of electrons without actual contact with either of the electrodes, and being then propelled along the lines of force of the field to the electrodes. It is by this means that the phenomenon is turned to good account on a practical scale.

It will be remembered that, some years ago, Sir Oliver Lodge, who has always been keenly interested in the phenomena of static electricity and allied questions, discussed the feasibility of employing this method for dissipating fogs on the large scale. Mr. B. H. Thwaite applied it experimentally to the purification of blast-furnace gases, but was hampered by the lack of suitable apparatus for generating a supply of static electricity—if it can be called static under the conditions of use.

In the United States remarkable progress has been made, with the aid of high-pressure transformers and mechanical rectifiers, and we give elsewhere in this issue some account of the methods recently employed and the results obtained. The earlier stages of the work were described in an article which we published in our issue of January 17th, 1913.

The simplicity of the apparatus and the small consumption of power render the system cheap to install and economical to maintain, while the efficiency of the process is surprisingly high, as much as 98 per cent. of the suspended matter, or even more, being deposited. In some cases the deposit itself contains valuable substances, the recovery of which may be worth many times the cost of its collection, and, indeed, we are told that at a Portland cement works the potash salts precipitated, which had previously wrought great injury to neighbouring orange plantations, proved to be an excellent fertiliser for the orange trees; the process may also be employed not merely for the prevention of nuisance, but as an actual intermediary to other industrial processes of manufacture. In other cases the sole object is to prevent the fouling of the atmosphere, as in the deposition of smoke, which probably offers the widest field of utility, and indirectly may confer immense benefits upon mankind.

In this connection we may emphasise the fact that the progress made in the United States has been due almost wholly to the efforts of a few men—especially Dr. F. G. Cottrell—who formed a philanthropic body for the purpose of research; the result of their work has been the repayment of the original capital and the accumulation, within three years, of ample funds to prosecute the work on more extended and efficient lines. It is especially significant that the money has been paid by clients who have found the process of commercial utility to their undertakings. The Research Corporation makes no profits for individuals. We strongly commend the subject to the notice of the British Coal Smoke Abatement Society, in the hope that that body may find it desirable to work on similar lines, and thus to accelerate the attainment of its altruistic aims.

As the power required rarely exceeds a few kilowatts, the kenotron, of which we gave a description in our last issue, appears to be ideally adapted for use in the process of precipitation, in place of the mechanical rectifiers hitherto employed; the fact was pointed out in the discussion by Dr. Dushmann. Curiously enough, the kenotron itself depends for its operation upon the flow of electrons between electrodes, with the vital difference that in this case the intervening space is evacuated to the utmost possible extent.

That knowledge of every phase of Nature is ultimately useful to man is further exemplified in this relation. First-year students in technical colleges, 10 or 20 years ago, we fear, despised if they did not abhor the rather flimsy apparatus with which they studied the phenomena of static electricity; but they were wrong. Even the electroscope, so apt to leak or to stretch its leaves to pieces, has proved to be invaluable in the investigation of radio-activity, to which we owe so much already. In wireless telegraphy, in the working of transmission lines at very high pressures, in the deposition of dust, in the acceleration of plant growth, and in other directions, the science of electrostatics has "made good," and we may yet owe to it the purification of the atmosphere and the improvement of crops on the largest scale.

A few days ago a deputation from the Royal Society and the Chemical Society pointed out to the Presidents of the Boards of Trade and Education that British industry was hampered by the starvation of scientific research and the lack of appreciation of scientific work on the part of the public generally, and advocated the adoption of measures by the Government for the assistance of scientific research. We are pleased to say that both gentlemen gave the deputation a very sympathetic reception and fully endorsed their claims, stating also that proposals were under consideration for the formation of an organisation for the purposes suggested. This is indeed good news. The undoubted success of the National Physical Laboratory bears out the statements of the deputation, and points the way to the attainment of their desires, in part; but the education of manufacturers and the public generally to an adequate realisation of the part that is now played by science in connection with industry, and the vastly more important benefits that it can confer upon the latter, ought to be vigorously carried on by every possible means, as one of the most effectual weapons with which to defend ourselves against our present and future opponents.

Rubber. THE tone of the market for rubber has been, on the whole, quiet during the past two or three weeks. There was at one time a tendency to improve, and a very fair volume of business was transacted, with No. 1 Crepe rising to 2s. 4½d. per lb., but this was the apex, and the market has since undergone a reactionary tendency, the full extent of the fall being not far short of 2d. per lb. It appears that arrivals from abroad are being dealt with more rapidly than was the case some time ago, which, of course, ensures a larger supply of material avail-

able for the satisfaction of trade requirements, while the demand at the same time has been on a rather less active There has been some talk of difficulties experienced in connection with making shipments abroad, owing to the necessity of securing licences, and this may account to some extent for the easier tendency of the market just lately. Nevertheless, there is some confidence felt that Russian demands will develop on a large scale before long, and the resumption of navigation at Archangel is regarded as somewhat of a bull point. It is quite clear that production is making fairly satisfactory headway in the Near East, and it is significant that the cost of output is in all directions undergoing a marked and sustained reduction. It is impossible for the general tendency of rubber prices to be other than on the easy side while the average cost continues to fall, and while the world's trade is at sixes and sevens owing to the war. The exports of plantation rubber from the Federated Malay States during the month of April amounted to 2,777 tons, as compared with 3,418 tons in March, and 2,151 tons in the corresponding month of last For comparative purposes the following table of exports from the Federated Malay States will be found interesting: -

			1918.	1914.	1915.

British Industries Fair. THE exhibition that is now in being, and will remain so until Friday next, at the Agricultural Hall, Islington, has afforded British industries an opportunity

such as we do not think has ever occurred before of bringing together under Government auspices an imposing collection of articles in which there is scope for a very large turnover. It is not an engineering exhibition, nor is it, save in respect of a very few popular and specialised lines, electrical, but we do not criticise it on those grounds, for the hall is packed with a very excellent collection of all sorts of things which. generally speaking, cannot well be displayed side by side with electrical manufactures. We doubt if there is anywhere in London a building anything like large enough to accommodate all branches of industry with exhibits on such a scale as to satisfy everybody. To attain to such proportions we should have to organise on the vast lines that have characterised some of the great international exhibitions, and unless we monopolise the White City, the Crystal Palace, or some other such site, that is impossible in London. War time is not a convenient time for organising a mammoth exhibition—the present collection of manufactures has had to be organised and brought together in as many months as a big exhibition would have taken years. In some respects the conditions of war time, which have really given rise to the holding of this display, and made for its success, have militated against the making of the necessary arrangements by exhibitors. Considering all the peculiar circumstances of these times, we must congratulate the Board of Trade Commercial Intelligence Department and the exhibitors upon the excellence of their Fair. We cannot remember any occasion when an exhibition has been so complete on its opening day as was this one when Her Majesty the Queen made her tour of the Hall on Monday Though, as we have said, the exhibiafternoon last. tion is not devoted in anything but a casual way to the classes of manufactures which we represent, we welcome it as an excellent augury for the future. Though the Board of Trade may have been criticised for some things that it has done and in respect of some things left undone, it gives promise here of a development of a trade interest which cannot fail to meet with acceptance at the hands of industry, however much it may displease private exhibition promoters. We look to the Board of Trade, now that it has shown in these months of war how excellent a teginning it can make, to proceed consistently with the larger policy of trade encouragement that everybody industrial desires.

# THE ELECTRICAL PRECIPITATION OF SMOKE AND FUMES.

AT a meeting of the American Institute of Electrical Engineers in February, a symposium of papers was presented on the subject of the electrostatic precipitation of fumes, smoke, dust, &c., from which it appears that valuable progress has been effected in this important field. Dr. F. G. Cottrell, to whose work we recently referred, described very fully the history of the subject, which was mentioned as long ago as 1824; the work of Sir Oliver Lodge, which received special attention, led to the formation of the Research Corporation in the United States, by Dr. Cottrell and others, to study the process. Sir Oliver Lodge's work had been directed especially to the precipitation of fog in the atmosphere; that of Dr. Cottrell was directed towards the precipitation of fumes and smoke as the more pressing problem, which would assist in solving the former.

The progress of the work of the Research Corporation was described in a paper by Mr. Linn Bradley, who pointed out that there were dangerous pitfalls to be avoided, and that a process worked out to perfection in the laboratory might have to be enormously modified before it could be applied to practice; not only was it necessary to be fully conversant with the process itself, but also it was essential to be well acquainted with the details of operation of the

plant to which it was to be applied.

The Research Corporation was organised in 1912 to develop certain patents assigned to it gratis by Dr. Cottrell and his associates, and the stock-holders were prohibited from ever making any profits from their holdings; the working capital was only £2,000, and therefore clients were required to pay all expenses incurred in connection with their particular problems. A commercial plant, designed by Dr. Cottrell, had then been at work for two years condensing sulphuric acid mist in a California smelting works, and this is still in operation.

Experimental installations had been put down in other works, and electricity had been employed for separating water from crude oil with which it was emulsified. A plant installed at a Portland cement works in 1912 has been extended, and now deposits about 100 tons of dust a day from the gases from rotary cement kilns. In another case the gases from copper matte converters were treated, to reclaim the lead compounds, and this installation has been extended to the whole of the converters at Garfield, collect-

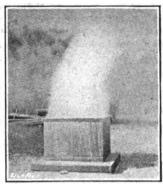

ing over 95 per cent. of the suspended matter.

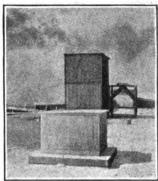

Briefly stated by Mr. Bradley, the method employed is to subject the gases and suspended particles to the action of a strong electric field maintained between "collecting electrodes" and "discharge electrodes." The current flowing through the gases must be unidirectional, and is obtained by transforming alternating current up to, say, 100,000 volts and rectifying it. Pressures up to 250,000 volts have been rectified successfully. The form of the electrodes depends very largely upon the local conditions, which vary greatly. Provision must be made for access to the electrodes and insulators, and for the removal of the dust or liquid deposited. Slight changes in the methods employed have sometimes converted apparent failures to complete successes, and no detail must be considered unworthy of attention.

At the Raritan Copper Works valuable fumes remained in silver refinery gases of a very corrosive nature, even after they had passed through a water scrubber. Cast-iron was used for some parts of the electrodes, and an alloy of lead and antimony for other parts. With 2.5 to 3 kw. at 35,000 volts, several thousand dollars' worth of fumes have been saved. An improved type of treater employing lead pipes, 12 and 24 in. in diameter, has been employed with advantage in recent additions, and further improvements have been made by installing a 10-K.V.A. 25-cycle single-phase 100,000-volt transformer. The deposited fume sometimes starts an arc between the electrodes, and to meet this difficulty an automatic device has been successfully adopted.

At the plant of the Hooker Electrochemical Co. a large volume of air containing a small percentage of chlorine gas is treated for the removal of the latter; hydrated lime dust is used to assist in the removal, and a few tons of weak bleaching powder are collected daily.

The volume of gas is 30,000 cb. ft. per minute, and the power used is 3 to 5 kw. at 50,000 volts. The effect of the treatment is shown in figs. 1 and 2.

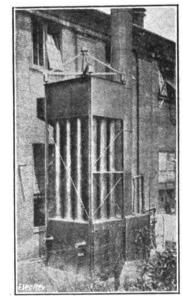

PRESSURE OFF.

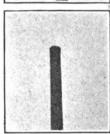

PRESSURE ON.

FIGS. 1 AND 2.-EXHAUST FLUE FROM TREATER AT THE HOOKER ELECTROCHEMICAL WORKS, NIAGARA FALLS.

A boiler used for testing coals at the U.S. Bureau of Mines was fitted with a treater to eliminate black smoke, consisting of 12 iron pipes 12 ft. long by 12 in. in diameter, through which the gases were led. The electrodes passed through the pipes, which were placed vertically, as shown in fig. 3. With one kilowatt at 50,000 volts the result shown in figs. 4 and 5 was attained. Mr. Bradley states that the smoke can be precipitated readily, and the insulation problem is not now a difficult one; the apparatus uses little power, and can operate continuously with but little attention.

U.S. BUREAU OF MINES.

-SMOKE TREATER AT THE FIGS. 4 AND 5.—PRESSURE OFF AND ON.

The most puzzling question is what to do with the material deposited!

Many other examples were given by Mr. Bradley, such as the removal of tar from illuminating gas, the deposit of fume from sintering machines and detinning plant, dust from food product works, fumes from roasters, &c.

An important opening is found in the removal of mechanical impurities from gases containing volatilised substances such as arsenic, so that the latter can subsequently be condensed and recovered without further refining. iron pipe as large as 4 ft. in diameter has been successfully employed as the collecting electrode, with a pressure of 250,000 volts and a mechanical rectifier. An installation for collecting potash salts volatilised from feldspar employs 40 pipes 14 in. in diameter and 12 ft. long, the electrode spacing being 7 in.; the temperature of the gases ranges from 500 to 1,000° F., and the volume dealt with runs up to 18,000 cb. ft. per minute. The voltage is 70,000 volts, and the power factor 70 to 80 per cent.

An installation for collecting volatilised hydrochloric acid was recently put down with complete success at the first attempt, the exit gases being so free from acid that a trace of it could hardly be detected by delicate chemical tests. Treaters are also being installed at sulphuric acid works, to eliminate suspended particles from sulphurous gases before delivery to a Glover tower; in this case the treater will be in three sections, any one of which can be laid off for repairs without interrupting the process. Various other installa-

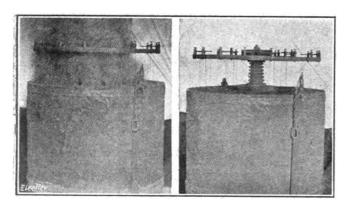

FIG. 6.—TOP OF PRECIPITATOR. FIG. 7.—ONE SECOND AFTER PRESSURE OFF. CLOSING THE CIRCUIT. CLOSING THE CIRCUIT.

tions are in hand, including one for cleaning iron blastfurnace gases at the works of the Bethlehem Steel Co.; we may here mention that the late Mr. B. H. Thwaite, the first to generate power from blast-furnace gases in gas engines, made a number of experiments with the object of cleaning the gases by means of electrical precipitation many years ago. Several companies have purchased licences to use the Research Corporation's processes, and the success already attained with a small staff has enlarged the resources of the Corporation, which has thus been enabled to engage a larger staff and create special departments to deal with the various classes of conditions. The original stockholders have been repaid, and the Corporation has nearly £30,000 in hand. Mr. Bradley gave a long list of industries to which the application of the process was pending or in operation, and touched upon many points which we have not space to deal with

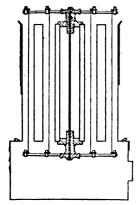

FIG. 8.—SECTION OF STRONG-NESBIT PRECIPITATION CHAMBER.

here. His paper, to which a bibliography is appended, will rank as a classic in this comparatively new branch of electrotechnics.

Another paper on the subject was contributed by Prof. A. F. Ne bit, who approached it from the theoretical and experimental side, showing that the particles suspended in a gaseous medit m, when subjected to the action of intense electric fields, became charged by the action of the travelling ions and electrons, and consequently tended to travel along with these ionic streams.

Electrical precipitation takes place on an enormous scale in Nature—the downfall of rain after a flash of lightning is a familiar example.

A negative ion is formed when a neutral molecule of a material substance has imparted to it from any source one or more electrons in excess of the number contained in its neutral state; similarly a positive ion is formed when one or more electrons are removed from a neutral molecule.

These ions may become the centres or nuclei about which large aggregates of particles may be clustered. Ionisation may be produced by high temperatures, chemical action, the

electric field, and other agencies.

The author described a precipitator designed by Dr. Strong and himself, consisting of groups of 25 pipes 4 ft. long and 5 in. in diameter, through which fine wires were stretched, as shown in fig. 8. Figs 6 and 7 show the appearance of the top of the apparatus when 900 cb. ft. of coal smoke was moving through it per minute at a velocity of about 5 ft. per second. The instantaneous change

produced by the electric field is striking.

The author stated that the action of the precipitator was due to the corona discharge from the electrodes. wires were positively charged, the corona appeared to occupy nearly the whole cross-section of the pipes; when the wires were negative, the coronas round them were only a few millimetres in radial depth. It was found that an alternating corona precipitated about 50 per cent. of the suspended matter; the positive corona deposited 70 to 80 per cent., and the negative 95 to 98 per cent. The inefficiency of the alternating current was due to the reversal of polarity of the active electrode, and therefore of the motion of the electrons and ions. With hot air passing through the pipes and a negative corona the breakdown voltage was about 32,000 volts; with cold air the voltage was slightly greater, and with a positive corona the voltage was less in The breakdown voltage was about the same for cold smoke as for cold air, but with hot smoke the voltage had to be decreased to 28,000 volts. There was but little deposit on the electrodes, and such deposit could be dislodged by the momentary application of a disruptive discharge.

Prof. Nesbit pointed out that the process not only precipitated carbon from smoke, but also ash, which could not be eliminated from the flue gases by the most efficient stoking. The cleaning of producer and blast-furnace gases offered an important field for the system.

# LARGE ELECTRIC FURNACE FOR ROUTINE FOUNDRY WORK.

[COMMUNICATED.]

THERE is, among many engineers, a tendency to regard electric steel furnaces as a luxury—capable, it may be, of producing and refining limited quantities of high-grade tool steel and other superfine products, but economically impracticable for ordinary foundry work. With large and highly efficient turbo-units, such as are now to be found in all our large industrial centres, this presumed limitation of the utility of electric furnaces cannot be justified. A number of electric furnaces are already in use in Sheffield and other steelworking centres, and important additions are frequently being made to their number, but, with the exception of a few installations described in these columns during recent years, little information has been published concerning British experience in this field. It has been suggested repeatedly that electric furnaces cannot compete with other types in melting large charges, and it is, therefore, specially interesting to note that in the Otis Foundry, at Buffalo, a 3-ton electric furnace is in operation, melting and working up 54 tons of steel per six-day week. furnace represents a serious attempt to make electric steel castings on a scale comparable with open-hearth practice, and so successful has it proved that, after only six months' operation, it has been decided to put in a second furnace of equal capacity. Energy is taken from Niagara, but the secret of successful operation does not lie in this fact. Unfortunately, the actual price paid for energy is at present withheld, though it is interesting to note that a considerable reduction in rate is allowed in consideration of the furnace being operated only between 7 p.m. and 6 a.m., the day staff being engaged solely in moulding. It is stated, however, that the furnace consumes 655 kw. for two hours at a time, and averages 64,000 kw.-hours per month. From this information it is easy to see that abnormally cheap energy is not at the root of the furnace's success. In Sheffield a number of electric furnaces are supplied at 0.33d. per kw.-hour, but even assuming 0.5d. as an easily obtainable power tariff, the Otis furnace would cost  $0.5d. \times 64,000 \times 12 = £1,600$  per annum to supply on this flat rate. The equivalent charge per horse-power demand (the usual basis for bulk supply from Niagara) would be £1 16s. per H.P.-year, and it is not probable that anything like so low a rate is obtained even under the limited-hour agreement. In other words, electrical supply in steel-working centres in this country is cheap enough to permit equally satisfactory operation for general foundry purposes of such electric furnaces as that now described.

Energy is taken at 2,200 volts three-phase and transformed by two Scott-connected transformers to 220 volts single-phase, which is further reduced by ohmic losses to 195 volts net, across the arc. The furnace is of the Snyder tilting type, built of riveted steel plate and lined with silica brick. The bottom is of silica sand, and the domed roof is of silica bricks carried in a detachable cast-steel ring, and has a life of 150 to 175 heats (four to six weeks). Two spare roofs are kept ready for use, only two or three hours being occupied in replacing one that is burnt through. The total cost of linings and repairs averages less than 2s. 6d. per ton of steel.

A single 6-in. graphite electrode passes through the roof and costs about 2s. 10d. per ton of steel to maintain. This cost and the cost of linings and repairs compare very favourably with figures quoted in this country. Current is taken through the bottom of the furnace bed by a steel casting, the lower end of which is water cooled to protect the copper connections, while the solid upper end melts flush with the lining and is covered at the end of each shift, before the slag has "set" over it, by a steel plug which displaces the slag and leaves the contact sufficiently clean for current to pass at once, when the furnace is next placed in commission.

A factor which contributes very materially to the overall economy of the furnace is the possibility of using up machine shop borings and turnings. These have a scrap value of only 20s. or so per ton, and cannot be dealt with satisfactorily in open-hearth furnaces. The charge used is 70 per cent. of such turnings and 30 per cent. foundry scrap, risers and headings, &c. The larger pieces are charged first, and the fine material piled on top up to or above the charging door. The main switches being closed, the electrode is lowered and regulated by hand (under guidance of wattmeter indications) for 10 or 15 minutes, after which the furnace is self-regulating through a ratchet and rack and pinion gear. The turnings used are very rusty, hence charcoal is added for reducing purposes; thereafter procedure is practically as in standard open-hearth work, ferrosilicon or ferro-manganese being added towards the end of the heat. The castings to be made include electric motor frames and general elevator parts, typical analyses being as follows:—

				For motor frames.	For general castings.
Combined ca	rbon	•••		0.18 - 0.2	0.18-0.5
Silicon	•••		•••	045 - 05	0 35-0'4
Manganese	•••	•••	•••	0.1	0.4 -0.42
Phosphorus	•••	•••	•••	0.072	0.072
Sulphur		•••		0.02	0.02

Slag is made sticky and drawn out before pouring by iron rabble hooks. Moulding sand is charged towards the end of the heat if needed to thicken the slag. Rack and pinion tilting gear driven by a 5-H.P. motor is installed below floor level, and is operated from a drum controller behind a sheet steel screen opposite the pouring spout.

Four heats, aggregating nine tons, are run off during each night shift. The first melt occupies two and a half hours and the remaining ones less than two hours each. The normal consumption during these periods is 655 kw., corresponding to a load factor of 30 per cent. during the whole 11-hour shift.

Oxy-acetylene torches are used to trim headings and risers from the castings, and the oxygen for this purpose is manufactured electrolytically, using a 25-kw. motor-generator set consuming 3,300 kw.-hours per month. Most of the foundry machinery and the various cranes are operated electrically, the total electrical consumption being 84,000 units per month, of which 75 per cent. is taken by the electric furnace. With the installation of the second furnace, the night demand of the foundry will rise to close on 1,500 kw., a very acceptable addition to the supply station night load.

# AUTOMATIC-LIFT ACCIDENTS.

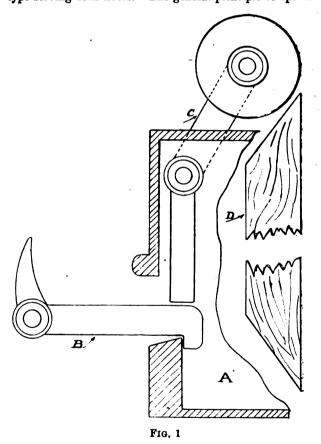

BY FRANK BROADBENT, M.I.E.E., M.Cons.E.

THE fatal accident which occurred recently in a well-known London club in connection with an automatic electric lift is one of those occasional reminders that automatic mechanism, no matter how perfect, is not infallible.

The facts of the case, however, show that a failure of the automatic gear to perform its function is, in itself, not sufficient to cause an accident of this kind, but that human oversight is a contributory agent.

oversight is a contributory agent.

The lift is of the kind known as the "full automatic" type serving four floors. The general principle of operation-

is briefly the following. On each floor there is a "calling" push which, on being pressed, "calls" the car to the land-In the car are five pushes, viz, one for each floor, emergency "stop" push. On pressing any of the and an emergency "stop" push. "floor" pushes, the lift automatically travels to and stops at the corresponding landing. Each opening is protected by a collapsible gate provided with an electromagnetic lock, the function of which is to prevent anyone opening the gate unless the car is standing behind it, and to render the lift inoperative when the gate is open. The general principle of such locks is shown in fig. 1, where A is the lock, B the latch, and c the lever operated by the car. Usually the apparatus is self-locking, that is to say, the locking lever is dropped by means of a spring or weight as scon as it is released by the car. The lever carries a roller on its free end, which engages with an inclined plane or striker 1) As the car passes a landing fixed on the side of the car. the striker lifts the lever, thus releasing the lock and permitting the gate to be opened. If anyone tries to open a

gate when the car is above or below it, he is unable to do so; but if he pulls against the latch whilst the car is travelling, the gate will open as the car passes it. The opening of the gate stops the lift, as the lock is electrical as well as mechanical, and the withdrawal of the latch breaks the electrical contacts which are connected in series with the stopping circuit.

This is somewhat of a disadvantage as the lock, although it contains contacts, is not intended to be used as a switch to break the circuit. Not only do we run the risk of burning the contacts by so doing, but also of causing arcing from one to the other or over to the case, particularly on circuits of 400 volts and over.

If the contacts fail to break the circuit when the gate is opened in the manner described, due either to their failing to separate, or to arcing over and maintaining an arc, or to being temporarily short circuited, the car continues to travel with the landing gate open. In these circumstances one of the following accidents may happen. The person who opened the gate may lose his balance and fall down the lift well; or, some one may fall out of the car on to the landing; or, some one may, expecting the car to stop, try to step out and get crushed between the landing and the car. All these are possibilities more or less remote, but possibilities nevertheless.

On the mechanical side there is the possibility that when the gate is shut and the car leaves the landing, the latch is not securely held. This may occur by reason of the locking lever not falling properly, due to some obstruction or to stiffness. In some cases even a piece of paper falling down the well and lodging between the lever and the framework might cause this; stiffness due to dirt or rust may be sufficient to hold the lever up; or the gate may ride up on dirt in the bottom track and cause the latch to foul the locking mechanism. If the lock fails to fasten the latch securely, the gate can be opened when the car in not behind it.

In the case referred to it is not possible to state precisely what happened, as the member of the club who unfortunately lost his life lived only for an hour or two after the accident, and never regained consciousness; and there were no eye witnesses who actually saw him open the gate. It is clear, however, that he opened the gate on the ground floor when the car was on the first floor, and fell down the lift well. On inspecting the lift on behalf of the club a few hours after the accident, I endeavoured to open the same gate when the car was not behind it, but after repeated trials, and using considerable force I was unable to do so. Thinking that there might be a sort of half-cock position in which the locking piece rested against the edge of the latch, I had the cover of the lock taken off and attempted to set the mechanism in such a position that whilst making electrical contact the latch could be lifted and the gate opened. In this I was unsuccessful.

I then tried the basement gate and found that after several attempts I could lift the latch. This gate, however, had been forced open a little while previously in order to extricate the unfortunate gentleman who fell down.

Whilst I was attempting to open the first floor gate with the car at the second floor, a member succeeded after several attempts in opening the ground floor gate, and called me down. On closing the gate I was able to open it again once, but after that failed to do so.

From this it would appear that there must be some position of the locking gear, which occurs probably once in a dozen times, in which the latch can be lifted when the lock is not released by the car. Assuming that one person in a hundred attempts to open a lift gate when the car is not there, and that once in 10 operations the lock does not secure itself properly, the chances of the gate being improperly opened are fairly remote.

In a case of emergency it must be possible to open a gate in some way or other, and anyone who is conversant with the mechanism of the lock can do so. In many cases, as in the lift in question, all that is necessary is to put one's arm through between the bars of the gate and lift the lever, performing in fact the same function as the car would do in arriving at or passing the floor. There is then the

possibility that, after opening a gate in this way, sufficient care is not taken to ensure that the gate is properly closed and secured before leaving it. Should this occur, the gate forms practically a trap for any person who comes along to use the lift, as in the event of his failing to note that the car was not at the landing, he would open the gate and step forward, possibly realising too late that he had made a mistake.

In factories such lifts are now in common use, and the workmen and factory lads very soon get to know how to open the gates. It is, in fact, not an uncommon thing for mischievous boys to slightly open one of the gates deliberately after watching the car pass to a remote floor. It is only necessary to open it a fraction of an inch in order to put the lift out of action. Another favourite trick of a man who wants to use the lift, and is not sure that it will stop at his landing, is to stand with his finger on the latch waiting for the car to pass. As soon as it reaches his landing the gate is unlocked and open it comes, stopping the lift, (assuming there is no fault in the electrical circuit).

Here, then, are two points capable of improvement. The first danger can be considerably lessened by placing the lock-releasing mechanism near the top of the gate, where it is not so easy to tamper with it. The gate must, of course, only be unlocked when the car is approximately at the landing level, and this is quite easily arranged.

The other weak point, namely, the ability to open the gate as the car is passing, is not so easily remedied, particularly in what are called semi-automatic lifts, in which some form of cage switch is used, as in this case the floor to which the lift is travelling is not selected until the car actually arrives at its destination. In the case of a full automatic lift in which the floor is selected as soon as the push-button is pressed, it would be possible to electrically interlock all the gates until the car had arrived at its destination. This, of course, introduces an additional complication, but in the interests of safety, particularly in factories where large numbers of men use these lifts, it may be considered worth while to add it. On the other hand, the less complicated the gear is the better, because, if it repeatedly gives trouble, the time comes when the engineer or electrician in charge will short-circuit or cut-out of action the cause of trouble, until he has time to attend to it properly, and, under these conditions, the whole lift is rendered unsafe. Moreover, these temporary jobs generally acquire a semi-permanent character.

As already mentioned, the possibility of accident is very remote, considering the number of journeys which a lift makes per day, and it is no doubt on account of the very small number of failures, taken as a percentage of the total number of journeys made by the lift, that one is apt to forget the possibility of accidents occurring, and to omit to take ordinary precautions.

The Nature of the Ultimate Magnetic Particle.—
In a letter under this title to our contemporary Science, Mesers.
K. T. Compton and E. A. Trousdale point out that for many years scientists have agreed in ascribing the magnetic properties of bodies to the action of exceedingly small elementary magnets, but the nature of these ultimate magnetic particles has been an open question. The influence of temperature, chemical composition and other factors has received the simplest explanation on the theory that molecules, or possibly groups of molecules, are the ultimate magnetic particles. On the other hand, the electron theory of magnetism seems logically sound, and is the only theory which has successfully accounted for diamagnetism.

The recently developed method of determining the positions of atoms within a crystal by X-ray photography, and the ferromagnetic properties of magnetite, hematite and pyrrhotite crystals, suggested a direct experimental method of eliminating one or the other of these two theories. By comparing photographs taken through these crystals while magnetised and unmagnetised, it can be determined with certainty whether or not the atoms have moved from their positions of equilibrium during the process of magnetisation. The authors have obtained experimental results with magnetite and hematite which indicate that the atoms do not leave their positions of equilibrium during magnetisation. These results are consistent with the electron theory of magnetism and prove conclusively that magnetism is not a molecular phenomenon.

#### CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### The Engineering Industry and the War.

Your issue of Friday last contains a letter from Mr. J. S. Warner, two paragraphs of which appear to me a gratuitous gibe at the medical profession, as unwarranted as it is irrelevant to the subject of that queerly worded lucubration. Mr. Warner says: "Try any medical man you like, and he does not know that the average female heart pumps blood as 3 is to 5 of the average male, &c." . . . Well, why should he? The facts as far as they were taught when I studied physiology are as follows: Weight of the heart (male): 266 to 346 grammes, average 312 grammes, = 1: 169 total weight of body. Weight of the heart (female): 230 to 340, average 274, = 1: 162 of total weight of body (Piersol). (Bouvière gives 275 as the average weight for both sexes—Precis d'anatomie, 1913.)* Mass of blood  $\frac{1}{13}$  to  $\frac{1}{15}$  of total weight of body (Arthur). Mass of blood propelled by the heart into the aorta during each contraction =  $\frac{1}{10}$  of the total, e.g., for a human being weighing 78 kg., containing 6 litres of blood, 6,000/30 = 200 ob. cm.

Thus, Mr. Warner's figures would apply in the case of a man and a woman whose relative weights would be as 5 is to 3, and only then. What of the old tag: sutor ne supra crepidam?

H, L, J.

London, S.W., May 8th, 1915.

* Rouvière's figures apply more particularly to French cases; Hutchinson's weight tables take the height into consideration without regard to sex, so does the old formula—

$$\frac{H'' G''}{17} = W lb. \left( \frac{Height \times girth}{17} = weight. \right)$$

#### Cab Signalling.

I hope you will allow me space in your valuable paper to contradict some of the statements that Mr. Acfield makes in the article appearing in your editions of the 16th and 23rd ult.

The notion that a cab signal should be audible only has often been shown to be both wrong and dangerous. No valid reason against making the cab signals both visual and audible has, as yet, been given in any of the many articles I have read on this important subject. The only "reason" I have ever seen advanced is the statement that the visual indication, notwithstanding the audible one, would take the driver's eyes off the track, and thus imperil the train. But this "reason" has been so often and so conclusively shown to be wrong, that I shall not ask for space here to repeat the proof against it.

Mr. Acfield attaches relatively undue importance to the distant cab signal indicators. He certainly must know that no distant cab signal, however satisfactory as a distant indication, could have been any good to the driver and fireman at the instant they both missed the home signal at Bromford Bridge. The Great Western distant cab signal did not prevent, and could not have prevented, the wreck at Reading, and would have been equally useless at Cannon Street.

Of all the cab signals that have come before the public, the only ones worthy of adoption, or test, are those which give indications that are both visual and audible, which plainly differentiate between clear, run slow, and stop, and which are controlled by means of electrical contact with ramps.

This fact has become so widely known that it is surprising to find that one in Mr. Acfield's position is still unaware of it.

Amos Ogden, M.I.M.E.

Dorby, May 9th, 1915.

P.S.—The Mr. Acfield referred to is of the Midland Railway.

# The War and Future Trade.

I quote from your leading article entitled "The War and Fature Trade," which appears in your issue of May 7th. You write:—

"It becomes more and more obvious as we study the problems of peace, even as superficially as is possible at this date, that that stage of this world confligration will be only slightly less difficult than are our vast and unprecedented naval and military operations. . . . We trust that Mr. Runciman will recognise the need that exists for a measure of modernisation and organisation with certain supplementary alterations making for greater efficiency and usefulness, supposing that he cannot see his way to adopt the proposals that are being again advanced in some of the more ambitious schemes that have been put before him by critics and advisers."

The correspondence that appeared in the *Times* in the summer of 1908, entitled the "Electrical Industry" dealt, I think, with very much the same problems as those to which your leading article refers. The minds of many of us were occupied

then as they are to-day—almost exactly seven years later—in endeavouring to find a solution of the difficulty of "industrial organisation."

In the month of July of that year I myself addressed a somewhat lengthy letter to the *Times*, suggesting that a Committee or organisation of business men should be formed in the City of London, with the object of attempting to study the disease from which I at the time felt that British commerce was suffering due to German competition, and I pointed out that it was hopeless to endeavour to prescribe a remedy before one had diagnosed the mulady.

I find myself seven years afterwards, with experience behind me, still writing, still talking, still trying to induce those connected with our industry as well as other business men in the City of London to believe that if we are to assure success in war or peace we must not be ashamed to learn from our errors in the past.

Lord Selborne, in his letter to the Times of to-day, pleads with much emphasis for national organisation. Mr. Bonar Law, in his speech in the House of Commons yesterday, argued upon much the same lines, but we still go on talking and writing and nothing is done. The fact is, I believe, that we do not know where to commence

To those members of our industry who are interested in this subject I would, therefore, make the following appeal, viz., that they should at once communicate with the Secretary of the London Chamber of Commerce, 97, Cannon Street, E.C., intimating that they would be prepared to attend a meeting, if called, for the purpose of endeavouring to solve the many intricate industrial and commercial problems arising out of this war. I have reason to believe that the London Chamber of Commerce is ready and willing to assist us to build the foundations of such an organisation as that for which everyone seems to see the need.

Edward Bergtheil.

London, E.C., May 11th, 1915.

[We shall gladly welcome the views of our readers respecting our correspondent's suggestion. We, of course, heartily support his proposal for a conference of the electrical industry, for we ourselves advocated it in our issue of October 16th last, page 514.—Eds. Elec. Rev.]

### PARLIAMENTARY.

Electric Railways (Facilities) Bill.—On Tuesday the Examiners had before them a late Bill to authorise the City and South London Bailway Co., the Central London Railway Co., the London Electric Railway Co., and the Metropolitan District Railway Co., or any of them, to make agreements with each other, and the London General Omnibus Co., for the purpose of providing increased facilities for the interchange and alternative routing of traffic, the application of receipts, and the appointment of a Joint Committee. Owing to the late notices, the Standing Orders of the House had not been complied with, and the Bill will go before the Standing Orders Committee, who will decide whether it shall be allowed to proceed.

Lincoln Corporation Bill.—A Select Committee of the House of Commons, presided over by Mr. Middlebrook, has considered the Lincoln Corporation Bill, which, amongst other things, provides for an extension of the electric generating station, and gives power to run trolley vehicles. Mr. S. Clegg, electrical engineer and tramways manager, gave evidence with regard to the extension of the station. The cost of the station was estimated at £36,260 exclusive of the land. There was no opposition, and the clause was passed. Mr. Forbes Lankester, K.O., explained the proposals with regard to railless traction, to which there was no opposition. What was proposed was practically a through route from east to west, on the lower level of the city. This part of the Bill was also ordered to go forward.

Plymouth Corporation Bill.—Lord Newton's Committee of the House of Lords on Tuesday concluded the consideration of the Bill of the Plymouth Corporation, which consolidated the Acts of Plymouth, Davonport, and East Stoneham, as the result of the amalgamation. The Bill covered 240 printed pages. A large number of clauses regulating the electricity and tramway undertakings were passed without any opposition.

Irish Electric Lighting Orders.—On Tuesday, No. 1 Electric Lighting Provisional Order Bill was ordered by the Examiners to go for first reading. The Bill confirms electric lighting orders granted by the Board of Trade to the Rural District Council of Clifden, Galway, and to the Urban District Council of Enniscorthy.

Electric Lighting Previsional Order (No. 2) Bill.—This Bill was ordered by the Examiners on Tuesday to go for third reading. It confirms electric lighting orders to the following local bodies:—Haworth U.D.C., Irlam U.D.C., Hull Corporation (Extension), Knaresborough U.D.C., Normanton U.D.C., Litherland U.D.C., Normanton U.D.C., Ryde Corporation (Amendment of Order), Shipton U.D.C., Stanley (Order granted to the Electrical Distribution of Yorkshire, Ltd.) and Tenby Corporation.

# NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### B.T.H. Loom Motors.

The extended adoption of electricity for the individual drive of The extended adoption of electricity for the individual drive of textile machinery has led to great advances in the design of simple induction motors for this purpose. These machines are totally enclosed and dust-proof, to meet the conditions prevailing in the mills, and usually run on three-phase circuits, with no regulating or starting apparatus other than a switch. For driving looms the motors are hinged to base-plates, with springs to control the belt tension and to facilitate smooth starting and running, as shown

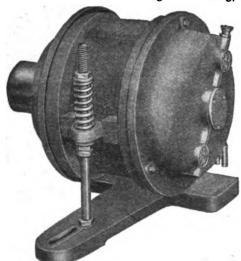

FIG. 1.—B.T.H. A.C. LOOM MOTOB.

in fig. 1. which represents a new line of loom motors recently broughtout by the British Thomson-Houston Co., Ltd., of Rugby.

The rotor has a squirrel-cage winding and runs in ball bearings, which are carried in solid end-shields; the base-plate is slotted to provide for adjustment if the belt stretches. The stator punchings are firmly clamped between cast-iron flanges, and are directly exposed to the air. As the motor is frequently stopped and started, the rotor is designed to have small inertia, and a special loom motor switch has been developed by the B.T.H. Co., of the drum controller type, giving two long breaks on each phase, with renewable contacts. The motors vary in size from \( \frac{1}{2} \) to \( 1\frac{1}{2} \) H.P.

# Witten Tramway Sectioning Switch.

At the request of a large municipality, the General Electric Co., Ltd., of 67, Queen Victoria Street, E.C., has constructed a sectioning switch for pole mounting on the tramway circuity, which consists of a 300-ampere "Peel" switch fixed in a cast-iron case, the case being of such a length that the switch can be fully opened and the lid closed. The lid is provided with a spring lock

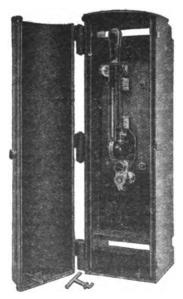

FIG. 2.-WITTON 300-AMP. TRAMWAY SECTIONING SWITCH.

and a special key. The sides of the switch case extend some distance beyond the back and fit on to the pole, to which the case is clamped by two steel bands, the ends of which are screwed and provided with nuts and washers.

## Spring Inspection Fitting.

THE STEEL TUBES AND CONDUITS Co., of Alice Street Works, Keighley, are now making a new inspection elbow and tee for conduit work, called the "Spring" inspection fitting, which they have patented. The advantages of these fittings are that they give more room to inspect and work in, the lid can be prized off quickly, and to refix it, it is only necessary to press it on again. If

FIG. 3.-INSPECTION ELBOW AND COVER.

the lid is not perfectly tight a slight pressure of finger and thumb on the lugs will adjust it. It is also very neat, and its price represents a great saving on the older patterns. The firm will be glad to give full particulars to anyone interested.

# LEGAL.

## ATWELL v. WEST HAM CORPORATION.

On May 5th, at the Bow County Court, before Judge Smyley and a jury, a case was opened in which Mr. A. E. Atwell, a former employé of the West Ham Corporation Electricity Department, claimed damages for injuries received from an electric shock, in April, 1914.

#### WHITTAKER r. L.C.C.

In a Divisional Court of the King's Bench Division Justices Lawrence and Bailhache heard the plaintiff's appeal in the case from the decision of Judge Harrington at the Wandsworth County

Court.

MR. McCall, K.C., said the action was brought to recover damages for injuries sustained by the plaintiff through being ejected last September from one of the defendants' tramcars. It was admitted that the plaintiff was lawfully in the tramcar, having paid for his ticket, and he was ejected before he reached the point covered by his ticket. At the trial certain questions were put to the jury, and they were answered in favour of the plaintiff. The judge entered judgment in favour of the defendants on the ground that as the act of the conductor was illegal and would have been illegal if the defendants had done it themselves, therefore, the defendants were not liable. The plaintiff got into the car at Wandsworth High Street and took a ticket for Exrlaffeld Station. Before the car reached Tooting the conductor accused Station. Before the car reached Tooting the conductor accused him of taking a penny journey for a halfpenny ticket. Plaintiff said he was going to Earlafield Station, and that he had paid a penny for his ticket. The conductor told him to leave the car, and summoned the driver. Plaintiff was hustled off his seat and

and summoned the driver. Plaintiff was hustled off his seat and pushed out of the car. He fell in the street and injured his ankle. The jury found that the plaintiff was ejected from the car; that he was not intoxicated; that the conductor did not think he was intoxicated; that he was ejected on the ground that the conductor thought he was endeavouring to travel to a point beyond that to which his ticket carried him; that the injury to his leg was the result; and they gave him £30 damages and found that plaintiff was not ejected through the malice or spite of the conductor. Counsel submitted that on these findings it was clear that the plaintiff was entitled to indepent.

that the plaintiff was entitled to judgment.

MR. CRAIG HENDERSON, for the L.C.C., submitted that the conductor ejected the plaintiff on the ground that he was committing a fraudulent offence. If his employers had been present in person the only remedy they could have adopted was to sek for the plaintiff's name and address. The conductor did not do that the plaintiff's name and address. The conductor did not do that, but promptly ejected him from the car and that was outside the scope of his authority, and the defendants could not be held liable. If the jury had found that the plaintiff was intoxicated there would have been no case for the Council. The power to eject a person was limited to a case where a man was intoxicated.

MR. JUSTICE LAWRENCE: Suppose a sober man smashes a since the interpretation of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the council of the counci

window and says he is going to smash the lot, what must the conductor do?—He must call a policeman.

MR. JUSTICE LAWRENCE: Then he can smash all the windows

and you cannot turn him out,
MB. JUSTICE BAILHACHE: Suppose two persons begin to fight

in a car, you are going to leave them there?

MR. HENDERSON: They are committing an offence against the by-laws and their names have to be taken.

MR. JUSTICE BAILHACHE: That is impracticable; the men are

In giving judgment, Mr. JUSTICE LAWRENCE said that if a person travelled beyond the distance provided for by his ticket it was a form of trespass, and unless the company had authority to remove him the authority of the Council would be rendered ridiculous, and they would not be able to protect their own property. The act of the conductor was wrongful, and the plaintiff had a right to sue. Judgment ought to have been entered for the plaintiff in accordance with the jury's findings.

Mr. JUSTICE BALLHACHE concurred, and indegment was given for

MR. JUSTICE BAILHACHE concurred, and judgment was given for

the appellant accordingly with costs.

LONDON TUBE RAILWAY COMPENSATION CLAIMS.

MB. H. CHATFEILD CLARKE, president of the Surveyors' Institution, has given his awards in the proceedings which he conducted as Arbitrator between the London County Council and the London Electric Railway Co., in compensation claims relative to several

easements and land for tube railways.

In the claim for the staircase built under the premises, Nos. 1 and 3, Oxford Street, measuring 45 ft. × 11 ft., and connecting and 8, Oxford Street, measuring 45 ft. × 11 ft., and connecting the Charing Cross, Euston and Hampstead Railway Station with the Central London Railway, the actual area taken was 484 ft., and Mr. Howard Martin, for the L.C.C., on the basis of 10 per cent. of the surface value, £6 per ft., brought out the compensation at £290, to which he added 10 per cent. for forced sale, making £319. The land on the surface was, he said, worth £2,904. The railway company's expert witnesses, Mr. Leslie Vigers and Mr. Douglas Young, presented valuations of £44 and £35 respectively, being based on £1 per foot run reduced to lineal feet.

The second claim related to a total area of 11.640 ft. at Kings-

being based on £1 per foot run reduced to lineal feet.

The second claim related to a total area of 11,640 ft. at Kingsway and Aldwych Island, part of a site of 120,000 ft., under which a tube ran at a depth of 88 ft. The site was stated by Mr. E. Morten, K.C. (for the L.O.C.) to be an exceptional one worth about £1,300,000, with a rental value of £50,000 a year. Mr. F. W. Hunt, chief assistant valuer to the L.C.C., gave evidence that the whole site would be damaged 1 per cent. of its total capital value, or £13,000, equal to a difference of three months' rental, or 10 per cent. of the part affected for surface value. For the railway company, Mr. Vigers and Mr. Douglas Young gave valuations for compensation amounting to £901. The latter characterised as extraordinary the statement that the presence of the tube depreciated the whole of the site.

The third claim involved the question of the easement under the

The third claim involved the question of the easement under the Shaftesbury Memorial Fountain, Piocadilly Circus. The easement was 36 ft. in length, and compensation was claimed at £1 per ft.run, \$36. The property around was acquired by the Metropolitan Board of Works in 1889, and the railway company's experts contended that the rate was settled by the Crown in 1890 at 2s. per ft.-run, which for 40 ft. came to \$4.

The Arbitrator has awarded the following amounts:—For Nos.

and 3, Oxford Street, £175; Kingsway and Aldwych I-land, £1,355; and Piccadilly Circus Fountain, £40. An award of £195 was made in respect of an easement under Southampton Row, between Vernon Street and High Holborn, subject to the surface area being in a street within the London Electric Railway Act, 1906, Sec. 59; and of £80 for an easement under the pier and stage of Victoria Embands. at Victoria Embankment.

#### NICHOLLS v. ASTLEY & BARWELL

In the Lord Mayor's Court, last week, before the Common Serjeant (Sir F. Bosanquet, K.C.), and a jury, a claim was made by Messrs. B. Nicholls & Son, electrical engineers, 54, Basinghall Street, E.C., against Messrs. Astley & Barwell, dressmakers, 385, Holloway Road, for £29 2s. 1d. for electrical fittings supplied and work done in installing electric light in the defendants' premises. The Road, for £29 2s. 1d. for electrical fittings supplied and work done in installing electric light in the defendants' premises. The plaintiffs' case was that an order was given by Mr. H. Astley, a brother of one of the defendants, who were two ladies carrying on an extensive dressmaking business. The plaintiffs, after making the necessary inquiries, proceeded to do the work, and upon completing the wiring of the premises on May 27th required payment on account. Mr. H. Astley had promised to get a cheque for £10 or £12. On June 3rd a payment of £3 was made. The plaintiffs were dissatisfied with the payment and sent their workman to bring away the tools. In consequence of a message sent by the workman that a substantial payment would be made the work was proceeded with. When it was completed and the defendants applied for payment of the account, a letter was received from Astley saying that the plaintiffs' account had been forwarded to him as the job had been carried out for him. The plaintiffs in their evidence, said at the time the older was given by Astley there was already an indebtedners owing by that party which was being paid off by instalments. The work had been done for the defendants and not for Astley.

For the defence Mr. H. Astley, a builder and decorator, was

For the defence Mr. H. ASTLEY, a builder and decorator, was called, and he said that the work of fitting up his sister's premises in Holloway Road was given to him, and he employed the plaintiffs, who agreed to carry out the work. The money which the plaintiffs had received on account was money he had paid out of his own funds. The plaintiffs had not rendered an account to him, and, therefore, he could not render the bill to his sister's firm. As soon as he did so he would receive newment and the plaintiff's account. as he did so he would receive payment, and the plaintiffs' account would be settled.

The jury found a verdict for the plaintiffs for the amount claimed, and judgment was entered accordingly.

#### TRADING WITH THE ENEMY.

In the City of London Court, on May 10th, before his Honour Judge Atherley-Jones, K.C., Mr. Otto Bohndel, trading as Schoen Bros., 29, Cock Lane, Snow Hill, sued Messrs. H. A. Jones & Co., electricians, 171, Holland Road, Shepherd's Bush, for £19 1s. 2d.

Mr. Jones said he admitted that the claim was due, but he dare not pay it, because the plaintiff was a German.

Mr. Harry Strouts, plaintiff's solicitor, said that the plaintiff was a first the plaintiff was a first that the plaintiff was a first t was a registered German. He had been carrying on business in London for 10 years.

DEFENDANT: He is a German agent for the sale of foreign goods.

Plaintiff's traveller, A. J. CONWAY, who said he was an Englishman, said that the plaintiff was not naturalised.

The JUDGE: Is he interned?

PLAINTIFF'S TRAVELLER said he was not.

DEFENDANT: His brother is.

DEFENDANT: His brother is,
CONWAY added that plaintiff bought all his goods from various
German houses, and paid for them outright. Some of them were
made in Germany. The goods were invoiced to the plaintiff.
DEFENDANT: These are all German goods, especially cable and
torchlights. I am trading with the enemy. He is a pure German.
CONWAY: Two-thirds of the goods are German.
DEFENDANT said that owing to the war his business was ruined,
but next week he meant to join the Army.
JUDGE ATHERLEY-JONES said he must give judgment for the
plaintiff. The law was clear, but whether it was the right law
was not for him to say. An enemy alien carrying on business in

was not for him to say. An enemy alien carrying on business in this country was able to enforce any contract which he entered into, and plaintiff was in that position. He might be as great an alien enemy as he liked, but while a benevolent Government left him at large-

DEFENDANT: God help us!

The JUDGE (continuing), he is able to carry on his trade and enforce his contracts, enforcing payments against British subjects. While I must give judgment for the amount claimed, it will be without costs as defendant had reasonable grounds for raising the question of the alien enemy. I will allow the Court fces.

DEFENDANT: He is ashamed to put his foot into this Court.

#### WAR ITEMS.

As Others see us!—A New York dispatch to the Evening News quotes from Collier's Weekly some extracts from a series of articles on Germany contributed by Mr. Albert Beveridge, former U.S.A. Senator, who interviewed the Kaiser, leading savants, industrial magnates, and others in Germany. Herr Walther Bathenau, of the A E.G., whose name and views are not unfamiliar to our readers, expressed himself in the following terms.

"In considering the causes of the war, we must distinguish between powder and matches. The match that fired the powder was Russia. But the powder was the inevitable conflict between England and Germany. On the surface this is a mere struggle for England and Germany. On the surface this is a mere struggle for commercial monopoly on England's part. But deeper down it is a struggle between two conceptions of life and duty. Take the chemical industry. There, 5,000 scientists, Germans, are glad to work for just a livelihood. Their real reward is their passion to discover Nature's truths. Also, there is their conception of duty. They are not only satisfying themselves by doing for its own sake what they love best to do, but they also feel that they are helping to build up Germany, and in a broader way to increase the sum of human knowledge.

"On the other hand there are in England let us say 30 scientists."

"On the other hand, there are in England, let us say, 30 scientists of the same ability and skill. But they must be professors of Oxford or Cambridge, or other schools of learning. They would scorn employment and work such as our 5,000 scientists do. Here scorn employment and work such as our 5,000 scientists do. Here we have the explanation of our superiority. Among us the love of knowledge is part of the German character. We feel we cannot have too much of it. To make it plainer, let me say that in Germany it is fashionable to be well informed. In England, on the contrary, it is felt that it is ungentlemanly to acquire more knowledge after a certain point of education. Englishmen say they dislike 'walking diotionaries.' Apply the idea of duty to one's country to employés of industry—say an industrial company of 30,000 employés, or a great bank with 10,000 employés willing to work not for food only but also as a matter of duty for the of 30,000 employés, or a great bank with 10,000 employés willing to work, not for food only, but also as a matter of duty for the building up of Germany. Contrast with this conception of life and labour the conception of the same class of men in England; as little work as possible, no more knowledge than is absolutely necessary, vacations, luxuries, and the mental and physical habits growing out of the same. These illustrations show why Germany has been able to sell her products in the foreign markets which England monopolised for so long. She thought they belonged to her as a matter of right. Conflict was inevitable. It is a difference of fundamental ideals of life and duty. That is the deep reason why the war must go on until it is proved which of these ideals is the true one. That is why we Germans are willing to die and suff ar worse than death in order to win."

Petrograd Electric Lighting Co.—A certain amount of interest is attached to the report for 1914 of the Petrograd Electric Lighting Co. of 1836, in consequence of the threatened sequestration of the undertaking, as mentioned in this journal on several recent occasions, by the Russian Government on the ground of the company being, as is alleged, almost entirely owned and controlled by Germans. As now announced from Petrograd, the company's accounts for 1914 show net profits, on a rough conversion of roubles accounts for 1914 show net profits, on a rough conversion of roubles into sterling, amounting to £683,871, as compared with £603,569 in the preceding year, the figures representing the proceeds realised by the works in Petrograd and Moscow for the whole of the year, and those from the works at Locz down to August 31st, as the directors have been without connection with the latter city since the date in question. It is proposed to place £33,900 to the reserve fund, as against £31,500 in 1913, to devote £142,500 to depreciation, as contrasted with £132,500, to pay a dividend of 11 per cent. on the £900,000 of preference capital, as in the previous year, 8 per cent. on ordinary shares of £3,100,000 as in 1913, and 4 per cent. on £1,000,000 of new ordinary shares which were issued in 1914. In addition the taxes on capital and net profits absorb £70,000, benevolent funds £21,500, and directors fees £21,436, the small balance remaining to be carried forward. It is, however, not intended to pay the dividends for the time being, but to transfer the sums available for these purposes to a dividend account to be created, and to leave to the directors the decision to fix a future date for the distribution. The latest information in relation to the proposed sequestration of the company is to the effect that the situation has not very materially changed, although no definite statement has been made.

changed, although no definite statement has been made.

A lively discussion is proceeding in the Petrograd Town Council on the question of buying up the electrical concessions in the town, including the business of the famous 1886 company. Opinions are sharply divided on the advisability of buying up all the electrical concerns, or only that of the 1886 company. Councillor Oppel insisted on the necessity of buying the electrical concerns in the near future. Both industry and private communers, he said, had an interest in their transfer to the town. Technical experts had shown that the transfer of the electrical enterprises to the town would involve increased capital outlay, as it would be necessary to improve the equipment of the electrical stations. At present the stations of all three electrical concerns of the town include in their equipment a considerable quantity of old machinery of comparatively little value. When the moment comes to buy, namely, in 1918, even their auxiliary value will be gone. As to namely, in 1918, even their auxiliary value will be gone. As to the revenue that may come to the town by exploiting these con-cerns, accountants value it at 3,000,000 roubles. But such an income is only-possible if the price of energy is not reduced. As it must be reduced, the revenue will fall to 1,200,000 roubles. It will increase by and by probably, for the lower price will attract new consumers, and extend the field of operations. But in order that the number of consumers should become considerable, the that the number of consumers should become considerable, the price must be reduced considerably. A slight reduction would not greatly affect the number. In the cost of exploiting the electrical concerns of the town, 70 per cant. goes for fuel; therefore, the town should turn its serious attention to acquiring the cheapest possible fuel for the concerns to be taken over. For the immediate future he thought it would be sufficient to buy out the 1886 company, which would cost the town 22,000,000 roubles, and promised a profit of 2,645,000 roubles. But if all three concerns were bought the cost would be 41,000,000, and the profit would be less. Another councillor thought that the existing town electric stations which councillor thought that the existing town electric stations which supplied the tramways with current should be enlarged to supply current for both lighting and industry. After the town had thoroughly consolidated its position, it would be better able to gather in all the other electrical concerns, and eliminate the private element. Councillor K. Ya. Zagorsky, whose views on the subject have been much discussed, said that Petrograd, like other large towns in Europe, should adopt the single electric station. In order to compete with the companies the town should construct a large power station. He considered it was impossible to formulate a definite plan for exploitation by the town owing to the rapid progress of the electrical business and modifications in its application.

Constantinople Telephone System.—The following circular letter has been issued from Broad Street Avenue, London, E.C., under date May 7th, by Mr. M. Webster Jenkinson, representative in the United Kingdom for the Constantinople Telephone Co. :-

"As possibly you are aware from statements in the Press, the Turkish Government have forcibly taken possession of the company's system in Constantinople. The general manager, Mr. Douglas Watsov, and the British staff were expelled from the comoany's buildings, and on the advice of the American Ambassador eft Constantinople, arriving in England last week. I have received a letter from Mr. Salem, the company's chief legal adviser in Constantinople, enclosing minutes describing the confiscation of the plant and property by the Turkish authorities, and a copy of the protest addressed by the Constantinople directors to the Turkish Government. It is hoped that it will soon be possible for the British staff to return, and for the company to resume possession of its plant and of course endeavour will be made to obtain a preserve of its plant, and of course endeavour will be made to obtain reparation for the loss inflicted by the action of the Turkish Government. The Turkish authorities have based their action on Article 23 of the Convention, which reads as follows:-

The State have full power to inspect and supervise the service, and the concessionnaire shall do whatever is necessary to facilitate this inspection. The Government also reserves the right to assume control of the service on all or any part of the systim when necessary for the public safety. The company shall have no right to demand compensation on this score.

The company has never interpreted this clause as giving the Turkish Government power to take physical possession of the company's plant and to expel the staff as they have done. The matter is receiving the most careful consideration of the European directors, and every possible step has been and will be taken to protect the interests of the shareholders and bondholders."

Italy.-We have received from the British Chamber of Commerce for Italy at Genoa List No. 15 of openings for British articles in Italian markets, from which we make the Many of these firms formerly did business with German and Austrian houses and now seek British connections:

No. 611.—Engineer at Rome requires further agencies for British technical and electrotechnical articles. R.A.D.B.

No. 622.—Commission Agent at Cantania requires electrical material, sunshades, fans. C.G.M.

No. 635.—Engineer at Florence wishes to represent on commission British manufacturer of iron plates, rails, steel, engines, cranes, machinery in general. F.P.P.

No. 639.—Merchants at Turin require fire-clay, china clay for paper mills, pig-iron, foundry articles, fire bricks, alloys. T.P.R.

No 642.—Commission agent at Padova wishes to take up British paints and varnishes, electric lamps, motor-cycles. P.N.

List No. 16, also received, contains the following:-

No. 652.—Commission agents at Turin are anxious to obtain agencies for British electrical machines, belting, oils, &c.

No. 657.—Merchant at Rome would take up British scientific instruments, machinery, electrotechnical material. R.A.O.

No. 664.—Commission agent at Genoa seeks agencies for seamless steel tubes, ship's auxiliary machinery, anchors, chains, machine tools, steel castings. G.F.M.S.

No. 675.—British firm at Rome inquire for addresses of manufacturers of copper and brass tubing, crude oil engines, machinery for flour mills, &c.

Dartford.—Fire Alarms Delayed.—In reply to a request from the Dartford T.C. that Messrs. Stuart & Moore should be allowed to proceed with their contract for the installation of the fire alarms, &c., in the town, the War Office have intimated that the firm (who are engaged on Government work) are in arrear with stores urgently required, and suggest that the Council might possibly see its way to arrange for the work to be carried out by some other firm not engaged on Government orders. The General Purposes Committee is of opinion that it would not be derirable to engage another firm to complete the installation, as an engage and but it is making temporary appropriate. suggested, but it is making temporary arrangements pending the completion of the contract.

Government Cable Contract.-Mr. Cecil Beck, in reply Mr. Booth in the House of Commons, on 5th inst, said Siegfried Hirschmann was still a co-director of the Union Cable Co., but the Office of Works did not know where he was residing. Before the contract was made the First Commissioner of Works asked for the appointment of a supervisor under the Trading with the Enemy Act. Mr. Booth: Can the Office of Works not find out where this man lives, in view of the importance of an enemy getting knowledge of our cable contracts? Mr. Beck: I think you rather misunderstand the situation. The Office of Works has no responsibility beyond seeing that the contract given is carried out.—

We have received the following letter on this subject:

"I have read the reply given by Mr. Beck, representing the First Commissioner of Works, regarding the contract given to the Union Cable Co., Ltd., in which it is stated that the managing director, Mr. Blackwood, was an Englishman, but the other four directors

are Germans.
"I wonder if it has occurred to Mr. Blackwood what every one of us who have any idea of loyalty think of his continuing to hold such a position, and with such associates.

"It is at last beginning to dawn upon us what our enemies

are capable of, and I shall be very much surprised if any British workman continues his employment in any business that has a single German, Austrian or Turk connected with it.

"When one raises the cry that the company is German, the palliative is offered—'Oh, yes, but British workmen are employed but, I ask, if the Union Cable Co. was closed down to-morrow, are would gladly give employment to their employés?

"A. R. MUNDAY. there not other truly British Cable Manufacturing Companies who

" Dablin, May 11th."

Victoria Falls Staff's Threat.—A Reuter dispatch from Johannesburg says that the majority of the men at the Victoria Falls Power Co.'s works at Brakpan, which supplies power to many mines on the Rand, sent an ultimatum to the manager declaring that unless all naturalised and unnaturalised Germans were discharged they would strike on Wednesday as a protest against the sinking of the Lusitania.

Electricity Staff Badges.—The Tonbridge U.D.C. has decided supply "Public service badges" to the staff of the electricity to supply

Board of Trade Publications.—The Board of Trade Com-mercial Intelligence Branch has issued a list of inquiries for sources of goods for the week ended May 1st.

Personal.—Included in the Committee appointed by Blackburn Chamber of Commerce to assist the Government in the matter of war munitions is Mr. S. J. A. Mills, consulting electrical engineer (Blackburn), and Mr. W. Lupton (chairman), engineer, of Accrington.

In the list of the survivors of the Lusitania we are pleased to see the names "Mr. and Mrs. Lines," Mr. S. L. B. Lines, of Toronto, is manager of the Canadian branch of Messrs, Chamberlain & Hookham, Ltd., of Birmingham. He left Canada at very short notice on a business trip to this country, and his wife who accompanied him is interested in Red Cross work. According to the Press reports, Mr. Lines was the last man to leave the ship, he having slid off the deck as the vessel went down. He grasped a raft, and eventually rejoined his wife at the Queen's Hotel, Queenstown. We offer Mr. and Mrs. Lines our hearty congratulations on their escape.

The Sales Engineer at the Walsall electricity works has enlisted for the duration of the war. The Engineer has been authorised to temporarily engage a man ineligible for military service.

Roll of Honour.—Private David Cousin Scott, 1st Royal Scotts, as killed in action at Hill 60 on April 22nd. Private Scott in as killed in action at Hill 60 on April 22nd. civilian life was an electrician under the Edinburgh Gas Com; missioners.

Sergeant Farquhar Kennedy, of the 8th Divisional Signal Company, Boyal Engineers, who has been awarded the distinguished conduct medal for showing great courage and resource in maintaining the lines of communication at Neuve Chapelle though exposed to heavy fire, has been for the last 15 years on the telegraph staff of the General Post Office, Glasgow.

# BUSINESS NOTES.

Consular Notes.—CHINA.—The American Consul at Chefoo, in a recent report, states that the Chefoo Electric Lighting Co., after a long delay, has finally begun to supply electric current to users in Chefoo. The company was formed on January 16th, 1913, with a capital of £10,000, subscribed principally by Cninese. It was duly registered with the Board of Works at Pekin on May 27th, 1913, and received its charter on that day. The plant, as it is now established, represents an outlay of about £5,000, and includes the following machinery:—Two complete sets of 100-kw. alternators, consisting of two alternators three-phase, 50-cycle, 3,300 volts; two Bellies-Moroom vertical compound engines; three 3,300 volts; two Belliss-Moroom vertical compound engines; three Baboock-Wilcox bellers, two Belliss-Moroom jet condensers and pumps, two boiler feed pumps, purifier and heater (combined), and the necessary switchboard. The managers are Chinese, but the chief engineer, his assistants and electricians, are Japanese. The company has spent about £5,000 in material and for erecting poles, &c., throughout the city, and has contracted a loan for £5,000 from the Bank of Industry and Commerce at Chafes. By the summer of this year the company expects that the a loan for £5,000 from the Bank of Industry and Commerce that he number of consumers will necessitate the further purchase of a 200-kw. alternator set. Chefoo is now splendidly lighted. The company estimates that about 1,000 poles will be necessary to fulfil its contract to light the city's streets. The lights on these poles are of 16, 25, 50, 100 and 200 c P. Outside the harbour harms are to be these 1000 c P. lights and the Language the set of 16. there are to be three 1,000-c.P. lights, and the Japanese post office has contracted for one 1,000-c.P. light. Thus far the company reports 1,300 consumers, while a great increase is expected as soon as the company is able to install meters, which it hopes to do shortly. Consumers are classified as (a) meter consumers, (b) shortly. Consumers are classified as (a) meter consumers, or equilar consumers on monthly contracts, and (c) occasional consumers. The charges are 9d. per Kw.-hour with 1s. minimum charge per lamp per hour, and 1s. per meter per month. The charges per lamp monthly contract range from 1s. 3d. for 5 C.P., 2s. 6d. for 16 C.P., 5s. for 50 C.P. to £2 per 1,000 C.P.

NEW ZEALAND.—The American Consul at Auckland reports that very satisfactory progress is being made in connection with the plan of the Dominion Portland Cement Co. to harness Wairua Falls for the production of electrical power and the establishment of a modern cement works at Kekarangi, near Whangerei, New Zealand. To carry out the scheme will entail an expenditure of upwards of £200,000. The plan involves building a canal 1½ miles long, having a width of 23 ft. at the bottom and 66 ft. at the top. This canal will take water from the river immediately above the falls, and conduct it to steel pipes 5 ft. in diameter, which will convey it to the turbines at the power station. The total fall convey it to the turbines at the power station. The total fall from the reservoir at the end of the canal to the river bed is about 140 ft., and sufficient water will be carried to generate 1,500 H.P. The company is developing two sets of this size, making a total of 3,000 H.P., but the station is being planned for four such units. The cables are of aluminium wire, and the voltage of the current will be 22,000. Arrangements are being made to furnish the city of Whangarei with electric light. Apparently American manufacturers are obtaining a substantial share of the contracts. It is said that one American company will furnish contracts. It is said that one American company will furnish about £40,000 worth of machinery and another £25,000 worth of dynamos, generators, transformers and other appliances. The contract for the dynamos is the largest made in New Zealand thus far, and was secured against strong competition from Europe. A wharf is being built in connection with the plant. Apart from the United States furnishing a large part of the machinery and marian angineer is acceptant the mill American engineer is erecting the mill.

CHILE.—The American Consul at Santiago reports that electric city ting is general in the cities of Chile, particularly in Santiago and Valparaiso. In steel and concrete buildings steel conduit is used, and in brick and adobe houses brass conduit or porcelain insulators are used in wiring. Steel conduits cost 91d. per yard, used, and in brick and adobe nouses brass conduit or porceign insulators are used in wiring. Steel conduits cost 9½d per yard, and brass conduits are sold for 2d. One of the electrical con-tractors states that about 10 per cent. of the wiring is done with steel conduit, between 60 and 70 per cent. with brass conduit, and the remainder with porcelain insulators. Brass is used because it is cheap and easy to work. Practically all tubing, both brass and steel, has come from Germany. The steel tubing comes with the threads cut.

Most of the electrical business is controlled through European houses. One electrical contractor who boys all his supplies from European houses states that he would not be willing to buy supplies from American catalogues because of the fear that he would not get just what he required, as the conditions are quite different from those in the United States. The tubing or conduit generally use in Chile and recognised and accepted by the two light and ower companies of Valparaiso and Santiago is what is known as Bergmann tubing. Any material used in electrical installations

has to be accepted by the traction and lighting company. However, an inspector of electrical installations is employed by the Chilean Government, and it is suggested that manufacturers and contractors take up with this inspector the question of the use of their material.

It has been stated that dealing with American houses has proved unsatisfactory in a number of cases, because if not quite enough money is sent for the article the order is not filled, and if too much money is sent some additional article is forwarded to the purchaser which he does not want, or the balance is retained as a credit against future purchases. The criticism of the occasional increase in charge above that quoted is also made against American firms by one of the electrical contractors. They understand that quota-tions in the United States often vary for the domestic trade, and that it is quite possible for variation to occur between receiving the quotation and placing the order; but inasmuch as the foreign business is sought, they feel that quoted prices should be maintained, at least until there is time for the order to be sent.

The regulations of the light and power company of Santiago require that persons desiring to make installations in houses where nower is to be need what agree to submit to the regulations and

require that persons desiring to make installations in houses where power is to be used must agree to submit to the regulations and conditions fixed by the company, and must use material approved by the company. These instructions also demand that 1,000 peece (about £29 at the present rate of exchange) be deposited by the person desiring to make installations, and that the company have the right to change the installations for his account if they are not properly done from the company's point of view, and shall also have the right to impose fines against him up to 50 peecs (29s. 2d.) each for infractions against the regulations, deducting these fines or charges from the 1,000 peecs deposited. It has occasionally occurred that the company would not connect with house installations made by persons whom they had not authorised, but the comtions made by persons whom they had not authorised, but the company is now forbidden by law to refuse to make connections when the person making them has done the work in conformity with the law. Any fines imposed are to be for the benefit of the city, and are to be made in conformity with the report of the general inspection of electrical installations.

inspection of electrical installations.

The Association of Fire Insurance Companies has no electrical code of its own. The tramway and light company, the National Government, and the Association of Fire Insurance Companies have inspectors of electrical installations.

It is obvious that the heavy American conduit, weighing 50 per cent more than the samples sent, is superior, but the question as to the need of the heavy conduit is at least an open one in the minds of the consumers. The matter of first cost is very important in Chile, and it is necessary to quote very close to the ordinary prices before the question of quality becomes of much interest. This might not be true in a country where there were many wooden buildings, but wooden buildings with electric lights are rare throughout Latin America. throughout Latin America.

Most of the contractors or merchants who handle conduits are more or less familiar with English, but there would be absolutely no chance for error in corresponding in Spanish with anybody in Chile, and it probably would be pleasing to most of the people of

the country.

Reyrolles and War Service.—Messes. A. Reyrolle AND Co., Ltd., of Hebburn-on-Tyne, are concentrating all their energies in producing their standard switchgear and accessories for For the information of firms or companies who are war service. war service. For the information of nrms or companies who are engaged on orders for war materials and may perhaps be extending their factories for the production of such requirements, the firm have in stock completed articles, or parts which can be quickly assembled, for 12,000 and 6,000-volt armoured switchgear, and 3,000 assembled, for 12,000 and 6,000-volt armoured switchgear, and 8,000 and 500-volt armoured draw-out panels (two types). These are being held in reserve for Government work only, and as they are ready to be put together, quick delivery can be given. The firm are also holding in readiness for similar service ironclad distribution boxes up to 400 amperes per way, ironclad switch fuses, 50 amperes, and wall plugs for portable drills and lighting. Both the switch-gear and accessories are made to comply with the Home Office Regulations. From time to time illustrated particulars of these manufactures have appeared in our pages, but firms interested can obtain a set of publications from Mesers. Reyrolle which cover the whole ground. whole ground.

Metal Markets .- Quin's "Metal Market Letters," which have hitherto been circulated privately among large consumers of, and dealers in, metals, and among merchant firms, now appear under the title of the Metal Bulletin, published twice weekly, on Tuesday and Friday mornings.

Prices Advance.—The India-Rubber, Gutta-Percha AND TELEGRAPH WORKS Co., LTD., of Silvertown, announce that, owing to the increased cost of production, both in materials and labour, consequent upon the war, prices in their List No. 27 (guttapercha, india-rubber, silk and cotton-covered wires, &c.) were advanced by 10 per cent. from May 6th, with the exception of toolboxes, tools, and jointing materials, the prices of which are with-

-Sheffield Tramways Department have for disposal a wheel boring and surfacing machine; Wigan Corporation has for disposal a quantity of scrap copper. Particulars are given in our advertisement pages.

Bankruptcy Proceedings .- James Wm. Tattersall AND TOM WHITAKER TATTERSALL, lately trading as Tattersall and Tattersall, electrical engineers, at Kimberley Road, Willeden and Tattersall, electrical engineers, at Kimberley Hoad, Willesden Lane, N.W.—An application for order of discharge was made on Tuesday to Mr. Registrar Linklater at the London Bankruptcy Court. Mr. Egerton S. Grey, Official Receiver, reported that the debtors failed last February, with provable debts £8,965 and assets that had realised £418; it was anticipated that a further £31 104, would be received, and that a dividend of about 7d. in the £ would be paid. The debtors commenced business in August, 1912 as motor engineers at 9. Regent Street, W. Their business. 1912, as motor engineers, at 9, Rigent Street, W. Their business, 1912 as motor engineers, at 9, Ragent Street, W. Their business, which consisted in the purchase and sale of carburettors, was successful; in August, 1913, they patented a salf-starter, in connection with which they registered the trade mark, "T. A. T." In the following November they took works at Kimberley Rand for the purpose of making these machines, and at the same time entered into an agreement with "The Imperial Motor Industries, Ltd.," under which that company were appointed their sole agents for the sale of the machines in Great Britain and the Colonies. The agreement further provided that the company The agreement further provided that the company should take delivery of 1,000 machines, at the rate of 60 a month, and at a price which would have produced a profit to the bankrapts of \$10,000. To enable them to meet the initial expenses of setting up machinery for the manufacture of these machines, the company advanced them £3,600: to enable them to deliver the said machines to the company they entered into subsidiary or n-tracts with different firms for the supply of the necessary parts; owing to delay in delivery of these parts they were unable to supply the company with the machines within the time allotted by supply the company with the machines within the time allotted by the agreement; as a result of negotiations the company expressed their willingness to vary the agreement in their favour, but on the outbreak of hostilities in August last notice to terminate the agreement was given them by the company for breach of contract, and the losses sustained thereby had resulted in their bankruptcy. The only offence reported by the Official Receiver was insufficiency of assets to pay 10s. in the £ to the creditors, and his Honour granted orders of discharge to both debtors subject to a nominal suspension of three weeks, remarking that to a certain extent the war had brought about the bankruptcy. extent the war had brought about the bankruptcy.

Dissolutions.—West Lancashire Cinema Co., Golborne.—Mesers. R. Bond (electrical engineer) and C. Whelan (painter and decorator), have dissolved partnership. Mr. C. Whelan will continue the business under the same style.

Coleraine Manufacturing Co., electrical engineers and manufacturers, 63, Turnpike Lane, Hornsey, N.—Mesers. F. C. Grund, W. H. A. Butterfield, A. E. Frost, and T. B. Batchelor have diesolved partnership, only as far as concerns Mr. T. B. Batchelor. Debts will be attended to by the remaining partners.

Private Arrangement, - Allen & Grosse, Ltd., Queen Street, Belfast, electrical engineers.—Au adjourned meeting of the creditors interested herein was held last week, when it was decided that the liquidation was to be continued with Mr. Kennedy as liquidator. The committee which looked into the value of the assets recommends the sale by the liquidator of the assets to Mr. Allen, one of the directors of the company, at, it is thought, such a price as will give the creditors a composition of 6s. 8d. in the £, at the greater part thereof or the greater part thereof.

Deed of Assignment.—A. HARTLEY & R. W. LEEK, electrical engineers, Colne.—Particulars of claims for dividend must be sent by May 29th to the trustee, Mr. R. A. Hargreaves, 2, Albert Road, Colne.

Catalogues and Lists,—Trafford Park Estates, LTD., Trafford Park, Manchester.—We have received a 60-page illustrated pamphlet giving very full information respecting Trafford Park and its excellent facilities as a manufacturing district. The important electrical and engineering works situated there have made the estates to our readers one of the most familiar industrial centres in the kingdom. Davelopments are constantly proceeding there, and a coloured map which accompanies the pamphlet shows the location of existing factories and indicates what land is still for sale or lease.

Armorduct Manufacturing Co, Ltd, Farringdon Avenue,

London, R.C.—Four-page illustrated and priced leaflet relating to "Little Hustler" electric drills.

EDISON & SWAM UNITED ELECTRIC LIGHT CO., LTD., Ponder's

Ead.—8-page illustrated leaflet particularising and stating reduced prices of Ediswan ironolad switches and switch fuses.

MESSES. ALEXANDER DUCKHAM & Co., LTD., Phonix Wharf,

Millwall, London, E.—Booklet giving information regarding their antiseptic "Immutol" cutting compound, and a list of user.

MESSES. DEAKE & GORHAM, LTD., 1, Felix Street, Westminster Bridge Road, London, S.E.—Folder illustrating their "El Grilstovo," an electric cooking set consisting of a circular heater, pan, and grill deflector, which they are pushing as a new summer celling line. selling line.

MESSES. STEEL TUBES AND CONDUITS Co., Alice Street, Keighley.—Priced leaflet relating to "Spring" inspection fittings.

Announcements.—The Peninsular Engi-NEERING Co., LTD., Suffolk House, Laurence Pountney Hill, London, E.C., inform us that they have been appointed sole agents for the firm of Luis Berenguer, en Cta. Barcelona, makers of high and lowtension porcelains for the electrical trade.

THE HOFFMANN MANUFACTURING CO, LTD., of Chelmsford, have opened offices at Victoria Buildings, 21, Grainger Street, Newcastle-on-Tyne, which are under the control of Mr. T. P. Brady. Telephone: No. 3736 Central; telegrams: Hoffmann, Newcastleon-Tyne.

# LIGHTING and POWER NOTES.

Barford.—The Warwickshire C.C. has given permission for the Barford Electric Supply Co., Ltd., to use overhead transmission between the village and Forge Cottage on the main road.

Barrow.—The Corporation Electricity Committee is making considerable extensions to meet the establishment of works engaged on Government orders. The L.G.B. has sanctioned the borrowing of £500 for the provision of switchgear and connections for the new turbo-alternator at the works, whilst mains are to be laid to a former candle works at an estimated cost of £1,150, and switchgear and a transformer.

Birmingham.—Temporary Power Station.— densers, and six boilers, each of 33,000 lb. evaporation; five wooden cooling towers are being erected to deal with the circulating water. The installation is to be housed in a steel-frame ing water. The installation is to be housed in a steel-frame building. At the present time the pile foundations of the permanent station are being put in.—Birmingham Daily Post.

Blackrock (Co. Dublin).—LOAN REFUSED.—The Treasury has refused the Council's application for a loan of £15,000 for an electric lighting installation in the township.

Bradford.—Mains Extensions, &c.—The Electricity Committee proposes to extend the mains at a cost of over £7,000. The Committee's agreement with Meesrs. Mitchell Bros. in regard to the bulk supply of current, is to be extended for a further period of 3½ years. Until further order the maximum price to consumers who are charged for electricity under the maximum demand rate, is not to exceed 4d. per unit. The Committee has decided to remit as from April 1st, the rental charges for such hired are lamps as cannot be used by reason of the lighting restriction order, until such restrictions are removed. The amounts paid in advance as rental for the three months ending June 30th will be kept in hand and made to apply for the three months immediately succeeding the revocation of the order. If a customer desires to terminate the hiring agreement, the Committee proposes to enforce the usual six months' notice.

Brighouse.—RATE RELIEF.—A sum of £300 is being allocated from the electricity undertaking towards the relief of

Bristol.—New Plant.—The Electricity Committee recommends the provision of a 6,000-kw. turbo-alternator with the usual accessories, at a cost of about £26,919.

Burnley.—Borrowing Powers, &c.—The Corporation is authorised to spend \$23,370 for H.T. alternating plant, and \$5,750 for mains; of the former \$15,000 has been borrowed, and 337 spent, and none of the second amount has been borrowed, but £2,646 has been spent.

In consequence of the L.G.B.'s circular the Electricity Committee has decided that no further sanctions be applied for in respect of any works not already commenced, or expenditure not already incurred, but that the L.G.B. be asked for permission to borrow money in respect of expenditure already incurred, and to which the department was already committed.

Bury,—YEAR'S WORKING.—On the past year's working of the electricity undertaking there was a net profit of £2,038, being a decrease of £147; £1,038 isto go to reserve fund and £1,000 towards the relief of the rates.

The T.C. has, in consequence of existing circumstances, decided not to proceed with the extensions to the Chamber Hall power station.

Canterbury.—RESTRICTED LIGHTING.—The charges for street lighting by electricity for the past quarter have been reduced by £249, owing to restricted lighting.

Carnaryon.—The T.C. has decided to take no action in regard to the suggested transfer by the National Electric Construction Co. of the electricity undertaking to a company by Act of Parliament, and the company's suggestion that the L.G.B. should be applied to for a suspension of its and the Council's obligation in the matter of the sinking fund instalments during the period of the war. A loan of £500 for the extension of the cables to the new tuberculosis hospital at Brynseiont has been applied for.

Chile.—The electric light and traction company of Valparaiso has demanded the rescission of its lighting contract with that municipality, owing to the non-payment of an account of a million and a half dollars for public lighting.—Review of the

Chipstead (Surrey).—Prov. Order—The B. of T. has granted a prov. order for E.L., at Chipstead, which is in the area of the Reigate R.D.C., and also for a portion of the parish of Woodmansterne, in the area of the Epsom R.D.C.

-The following persons have been granted permis-Cuba.-C103.—The following persons have been granted permission to install electric power and lighting plant:—Senor Benito Cabrera, at Fomento, Province of Santa Clara; Senor Francisco Frias, at Niquero, Province of Oriente; Senores José F. Prieto and José Lores, at Real Campina, Province of Santa Clara, and also at Cartagena, in the Municipal District of Rodas. The Gaceta, which contains particulars regarding the installations to be carried out, may be consulted at the Commercial Intelligence Branch of the

Dalkey (Co. Dublin).—E.L. Scheme.—The U.D.C. has under consideration a proposal to obtain from Kingstown a supply of electricity to light the town.

-The net profit on the working of the electricity undertaking for the past year amounted to £279.

-WAR BONUSES.—The Corporation Electricity Committee has decided to pay the employes a war bonus from May 1st, and to apply to the Government for War Office badges for men of military age emgaged at the works, on condition that they agree to join the Army if called upon.

The Council has decided to give notice to three clubs in the town that the existing contract for current for lighting will cease on June 30th, and that meters will be fixed to ascertain future consumption.

consumption.

Dundee.—LOAN SANCTION.—The Secretary for Scotland has authorised the borrowing of a further loan of £29,000 in connection with the electricity department.

Enniscorthy.—A provisional order has been granted to the Council for the supply of electricity to the town.

Epsom,—Fuel Contracts, &c.—The U.D.C. has authorised the acting electrical engineer to order for trial 10 tons of Mexican fuel oil for use in the Diesel engines. The cost will be 15s. below the price of American oil, which is £4 per ton, with a tendency to advance.

Gillingham (Kent).—The T.C. has decided to renew, for a further five years, the contract for the supply of current to the Millitary Barracks, &c., subject to the charge for lighting being increased from 2½d. to 3d. per unit. Owing to inability to obtain a loan for the capital outlay, the Electric Lighting Committee recommended that it could not accede to the request for a supply of current to Messrs. Goldsmith for the Rainham Cement Works. The Council has decided to ascertain whether the firm would pay the interest on the capital expenditure involved.

Ilford.—The U.D.C. has applied to the B. of T. for consent to erect a generating station on a site in Suffolk Road, Seven Kings.

London.—A conference on the subject of London electricity supply is to be held at County Hall on May 19th.— City Press.

-The B.C. has been recommended to increase the scale of pay of junior shift engineers in the electricity department from 30s. to £2 per week. The Lighting Committee has made a reduction of £380 in the charge for street lighting for the March quarter. The borough treasurer has reported on the question of loan sanctions and capital expenditure of the electricity department, and the Finance Committee recommends that application be made for loans of £1,566 for property and £4,975 for mains; the construction of cooling towers, to cost £4,250 is in progress, and it is desired to borrow money to complete this work. As regards a charmafor extension of mains believe to a continued estimate of the contraction of the second contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contrac scheme for extension of mains, boilers, &c., not sanctioned, estimated to cost £52,757, application for sanction has been made to the L.C.C., which is obtaining the views of the Treasury on the

Leeds.—Loan Sanctions.—The L.G.B. has sanctioned the borrowing of the following sums in connection with the electricity undertaking, viz., £36,600 for buildings, &c., £12,290 for suction ash plant, coal-conveying plant and crane; £8,066 for switchgear and foundations; and £3,070 for motors and mains in generating station (these being further instalments of the £200.000 loan), also £22,500 for a new 6,000-kw. plant, £2,500 for providing extensions for some £65,000 for mains (excess and building extensions for same, £65,000 for mains (excess and prospective expenditure) and £12,000 for sub-stations (prospective expenditure).

Leigh.—The T.C. has received a letter from the Leign.—The T.C. has received a letter from the Director of Navy Contracts pointing out that the Anchor Cable Co. had recently experienced difficulty in obtaining sufficient electric supply for their works, and that in consequence the Government work which the firm have in hand had been seriously delayed; the Town Clerk was instructed to send a copy of the letter to the L.G.B., with a view to expediting the application now before it for sanction to borrow money for further extensions to plant at the electricity works.

-RESTRICTED LIGHTING.—The E.L. Com. Maidenhead.mittee has offered the Corporation a rebate of 17s. 6d. per annum for each side street lamp extinguished, and 15s. per annum for each 100-watt lamp removed from the main street cluster lamps, or a total reduction of £263 per annum on the whole of the lamps supplied with current.

Nottingham.—YEAR'S WORKING.—The accounts of the electricity department for the year ended March 31st last show a net profit of £13,402, of which £9 500 is to be contributed in aid of the rates, and the remainder carried to the reserve fund. The number of units sold during the 12 months amounted to 12,860,348, an increase of 229,508 as compared with the previous year. Of this amount 3,805,574 was used for lighting purposes, 3,248,085 for power purposes, and 5,806,689 for traction purposes.

Oulton Broad.—RESTRICTED LIGHTING.—The U.D.C. has asked the Electricity Co. to allow an abstement of 50 per cent. in the charges on account of the restricted public lighting. company had offered a 5 per cent. reduction.

Rotherham.—YEAR'S WORKING.—The gross profit of the electricity undertaking for the year ended March 31st last shows a decrease of £2 201 as compared with the previous 12 months, due to the increased cost of productior, which went up from 651d, to 7001, per unit. The demand for power is still on the increase and greatly exceeds the combined supply for lighting and traction. On account of the reduced price per unit to the ing and traction. On account of the reduced price per unit to the tramways department during the year, there has been a saving to that department of £1,185, which represents nearly one-half of the fall of profits in the sale of electricity/for 1915 as against 1914. The total units have increased from 4,797,221 to 5,547,149, and the total receipts from £25,944 to £26,889, or by 3½ per cent. The department has been further affected by increases in interest and sinking fund brought about through recent extension to the works. The net profit available for appropriation has decreased from £7,358 to £4,786. from £7,358 to £4,786.

The B. of G. has decided to close down the Runcorn.electric light plant for the time being and use oil lamps. Some little time ago it was decided that the plant be overhauled, but this work is now deferred.

St. Anne's.—Year's Working.—For the year ended March 31st last, the Corporation E.L. department sold 1,914,703 units, as compared with 1,051,815 in the previous year. The number of consumers is now 1,632, an increase on the year of 182. The increase in the consumption for power purposes har, according to the electrical engineer, been stimulated by the reduced uniform price of 1d. per unit.

Saxilby (Lines.). - E.L. Scheme. - Mr. C. H. Best, who is acting with Mr. Chas. Pullan, of Bradford, has approached the Welton R.D.C. respecting a scheme of E.L. for the parish of Saxilly, and has applied for the Council's formal consent to the

Sheffield.—Loan Sanctions, &c.—Mains are to be extended at a cost of about £12,620. Of this sum over £11,000 will be spent on an additional extra H.T. feeder from Neeptend power station to Tinsley. The L.G.B. has sanctioned the borrowing of £134,373 for the purposes of the electricity undertaking, made up as follows:—£20,000 for sub-station buildings and equipment, transformers and power factor rectifiers (being part of application for £50,000); £36,813 for additional plant at Neepsend; and £27,660 for extension of buildings at Neepsend, and the purchase of 50-ton crane. Land is to be purchased in Forncett Street for use as a sub-station. for use as a sub station.

Southport .- The Electricity Committee has decided to inform the Finance Committee that it cannot see its way to con-

Inform the rinance Committee that it cannot see its way to contribute to the relief of the rates this year.

Occupiers who have given notice of intention to remove lamps outside their business premiser, are to be asked to allow the lamps to remain on the understanding that no charge will be made for

the hire of them.

The T.C. is to be recommended to approve a proposal to increase the price of electricity by 10 per cent.

Stanley.—Prov. Order.—The B. of T. has notified the Wakefield Corporation of its intention to issue a prov. order authorising the Electrical Distribution of Yorkshire to supply electricity in the district.

Sutton.—We understand that the South Metropolitan Cc.'s electricity works at Sutton are to be shut down, and that it is proposed to lay duplicate mains from Wandsworth to the present station, where the current will be transformed to the existing pressure and distributed.

Torquay.—In view of the restriction put upon loans, the T.C. has decided to discontinue for the present the laying of new mains in streets where the supply is not already available. The L.G.B. has intimated that there is no necessity for the purchase of premises in Victoria Parade for new offices for the electricity department. The Council, however, has decided to adhere to the principal of acquiring the premises, and to proceed with the purchase on its own responsibility. The Council has offered a supply for E.L. to the Torbay Hospital at 3½d. per unit.

Walsall.—LOAN SANCTION, &c.—With respect of the Council's application for sanction to a loan of £23,595 for the purposes of the undertaking, the L.G.B. has authorised the borrowing of sums amounting to £16,700.

A coal clause is to be inserted in all future agreements for a supply of alternating current in bulk. The lighting of the new road from Ablewell Street to Birmingham Road is to be carried and the lanteness augmented from the transverse many misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the transverse misses to be the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lanteness augmented from the lantene

out by lanterns suspended from the tramway span wires en both sides of the road.

Warrington.—A new turbo-alternator was formally started at the electricity works, at Howley, on May 6th.

Watford.—The T.C. has decided to defer all large extensions of the undertaking, and to make application for sanction for the money which has already been spent. The cost of any future house connections, &c., will be paid for out of revenue.

West Bromwich.—The T.C. has entered into an agreement to supply electricity up to a minimum of 80,000 units per annum for three years to the Mechanical Brake Co., and to give a supply for war purposes to Messrs. Ebenezer Parkes & Co., Atlas Works.

Wighn.—Proposed Loans.—Application is to be made to the LGB. for sanction to borrow £1,200 for a transformer, switchgear and cable required for the proposed supply of electricity to Pemberton Colliery Co., and £1,066 for a transformer, &c., to supply current to the Empress Spinning Co.

Wimbledon.—Street Lighting.—The E.L. Committee recommends a reduction in the charge for lighting the streets; in future one equal eighth part of the amount of instalments of loan, sinking fund and interest as shown in the net revenue account of the electric lighting accounts for the previous year, will be charged against street lighting, instead of one equal sixth part of the amount referred to as heretofore.

Wistaston.—E.L. SCHEME.—The Crewe Corporation has received the Nautwich R.D.C.'s consent to its application to the B. of T. for an order authorising the supply of electricity to premises in Wistaston.

Wolverhampton.—The Electricity Committee proposes to lay a new feeder cable from the School Street sub-station to Lea Road, at a cost of £1,130, and to carry out mains extensions at a cost of £730. Of this amount £133 will be provided out of the reserve fund, and the remainder out of the capital account, for which latter the sanction of the L.G.B. will be required.

# TRAMWAY and RAILWAY NOTES.

Accrington.—YEAR'S WORKING.—The gross revenue of the Corporation tramways for the past year amounted to £17,850, and the gross expenditure to £16,438; after deducting £8,233 for interest on loans, dividends on stock, redemption of debt and income-tax, there was left a disposable balance of £3,179, as compared with £4,722 in the previous year. The contribution to rate aid was £2,013, a motor tower-wagon cost £598, and £568 was devoted to depreciation and renewals. During the year 4,637,303 passengers were carried, and 548,070 car-miles run.

Bradford.—The Tramways Committee has authorised the general manager to arrange such modifications in car services after 9 p.m. as may be deemed fit on consideration of traffic returns, and recommends that the North Park Road car service be discontinued, in view of the continued low receipts shown by traffic returns. The Tramways Committee has approved a scheme for a central terminus at Forster Square.

Bury.—YEAR'S WORKING.—The net profit on the working of the Corporation tramways for the past year was £9,690, which will allow £5,600 to be paid to the rates, and £3,472 to be placed to the reserve fund.

Darwen. — YEAR'S WORKING. — The tramway department made a net loss of £172 on the Darwen section and £557 on the Hoddlesden section during the past year. The mileage run was 267,670, sgainst 266,912 in the previous year, and nearly 250,000 fewer passengers were carried.

Glasgow.—Female Labour.—This week an additional 50 women have begun their training as conductors, and next week over 100 women will be engaged in this duty in connection with the T.C.'s tramway department.

The tramway department, and on Monday of this week the million pounds sterling of revenue, which is now looked for, was secured. Up till Sunday night the total drawings amounted to £999.494, and Monday's takings brought the gross to £1,002,624. The total at corresponding date last year was £1,010,792, this year's revenue so far working out at £8,168 less.

Loudon.—The Standing Order Committees of both Houses of Parliament have been petitioned for special leave to deposit a Bill to authorise the City and South London Railway, the Central London Railway, the London Electric Railway, the Metropolitan District Railway and the London General Omnibus Co. to

enter into agreements "for the purpose of providing increased facilities for the interchange and alternative routeing of traffic, the application of receipts and the appointment of a Joint Committee."

L.C.C.—The Highways Committee is considering the desirability of the Council again bringing before the Treasury the great public need of electrifying the tramways in Grange Ruad, Southwark Park Road, Raymouth Road and Rotherhithe New Road. The service has been discontinued since May 1st, owing to the dangerous state of the rails.

The Treasury has advised the postponement of the Burdett and Grove Road tramway reconstruction, and of the purchase of additional turbine plant for the Greenwich station.

Manchester.—The City Council has rejected a proposal brought forward by Councillor Cundiff, that special constables should be allowed free rides on the cars when going to or returning from duty.

Nottingham.—YEAR'S WORKING.—There was a net profit of £28,664 on the working of the Corporation tramway undertaking for the year ended March 31st last; of this sum £22,500 is to be contributed in aid of the rates. Traffic receipts showed an increase of £4,850 at the end of July, after which there was a general falling off to the end of the financial year, notwithstanding the additional receipts obtained from the three extensions, and a full year's working of the Notts and Derbyshire Co.'s cars running between Church Street, Basford, and Parliament Street. The total receipts, including rent for the leased lines, but excluding interest on investments, amounted to £179,315, an average of 11'35d, per car-mile. This is an increase of £3 935 in receipts, but a decrease of '523, per car-mile, compared with the previous year. The working expenses amounted to £112,583, equal to 7'13d, per car-mile, compared with 7'45d, per car-mile. The consumption of energy for traction, car and depôt lighting, works machinery, permanent way repairs and renewals, and grinding out rail corrugations, was 5,806 688 units, costing £30,243. This is equal to 153 units per car-mile, compared with 1'51 units during the previous year. The number of passengers carried was 41,210,964, an increase of 675,000.

Oldham.—There was a loss of nearly £5,000 on the working of the tramways during the past year.

Plymouth.—Tramways Purchase Scheme.—At a meeting of the T.C. it was reported that the Devonport and District Tramway Co. was willing to selling its undertaking to the Corporation on Tramway Act terms at once, instead of in 1919, the Corporation to have immediate possession, and the price to be fixed by arbitration. These terms were approved, and it was resolved to enter into an agreement with the company. It was further reported that the Plymouth, Stonehouse and Devonport Tramway Co. was willing to hand over its undertaking to the Corporation at once, instead of in 1922, on terms to be agreed. It was resolved that an agreement be entered into accordingly, and in the event of a difference as to price, that the same be settled by arbitration.

Reading.—The net profit on the tramway undertaking for the year ended March 31st last amounted to £4,647, £3,000 of which is to go to the relief of the rates. The T.C. has decided to lay new feeder cables at a cost of £450.

Rotherham.—Year's Working.—During the past year the Corporation cars ran 815,547 miles, as against 852,869, in the previous year; the passengers carried decreased from 9.874,231 to 9,828,838. The gross profit of £14,901 was an increase on the previous year of £900, which, after deducting the usual allowance for redemption of debt and contribution to sinking fund and interest, leaves a net profit of £5,582, or an increase of £546 as compared with the preceding 12 months.

Salford. — Female Labour. — The Tramways Committee considered the question of the men's refusal to work with women tram conductors and the demand of the men for a bonus of 15 per cent. on wages, and ultimately decided to adhere to the decision to employ women conductors. In the matter of war bonuses, Salford had followed the lead of Manchester in giving a bonus of 23. a week to employés earning 28s. a week or less and a smaller bonus to those earning between 28s. and 30s., and it was decided not to vary this to meet the men's request. At the T.C. meeting last week, the principle of employing women was approved, and the question of the conditions of such employment referred back for further consideration.

South Shields.—At a meeting of the T.C., on the 5th inst., Alderman Lawson, in moving the adoption of a report of the Sub-Committee on the Parliamentary Bill, said there had been left in the Bill the tramway clauses giving power to extend the tramways to the borough boundary and down Mile End Road, which was a rather important and valuable power; they had also got the electrical clauses, which turned out to be more important than they anticipated.

Wigan.—A profit of £900 was made by the tramway undertaking last year.

# TELEGRAPH and TELEPHONE NOTES.

Retransmission of Cables.—The following official

announcement was issued on Tuesday last:—

It has come to the notice of the Home Office that persons and business houses in this country are receiving requests to retransmit cables between traders in neutral countries, and that in some cases these requests are made with a view to avoiding interference by the Censor by letting it appear that the sender is a well-known British firm. In this way the transmission of messages connected with trads with the enemy may be secured. All persons in this country are therefore warned not to undertake to retransmit cab'es unless the request comes from a client for whom they have been accus-tomed to perform this service, and unless they are satisfied that, by forwarding the message, they are not assisting trade with the enemy.

United States.—An action is in progress between the American Marconi Co. and the Atlantic Communication Co., which

American Marconi Co. and the Atlantic Communication Co., which operates the Telefunken system at Sayville, the former alleging infringement of its patents. Mr. Marconi has attended the trial to give evidence on behalf of the plaintiffs.

According to the report of the Census Bureau for 1912 the mileage of telephone wire in use was over 20 million miles; companies controlling 94 per cent. of the mileage reported 13,735 million calls, and that the capital of the above-mentioned companies was 991 million dollars. The net income was 51 million dollars, and the number of employés 183,000. The Bell system controlled 75 per cent. of the mileage and 58 per cent. of the telephones in 75 per cent. of the mileage and 58 per cent. of the telephones in 75 per cent. of the mileage and 58 per cent. of the telephones in use; the total number of telephones connected with public exchanges was 8 730,000. The number of independent rural telephone systems was 32,233. The number of telephones per thousand of the population rose from 30 in 1902 to 72 in 1907 and 91 in 1912; the messages per capita increased from 65 in 1902 to 122 in 1907 and 144 in 1912. 122 in 1907 and 144 in 1912.

The mileage of commercial telegraph wire, including ocean cable, was 1,882,000, the messages numbered 109,663,000, and the capital employed was \$232,000,000. The net income was \$6,400,000, capital employed was \$232,000,000. The net income was \$6,400,000, a reduction of one-third as compared with 1907, whereas the net income of the telephone companies increased 25 per cent. in that period. There were 38,000 telegraph employés. Six U.S. ocean cable companies owned 44,860 miles of cable, handling 2,845,000 messages, an increase of 20 per cent. over 1907. In addition, the Western Union Telegraph Co. operated 23,800 miles of cable and handled nearly 3,000,000 cable messages.

There were four wireless telegraph companies with 74 tower stations (117 in 1907), and a capital of \$9,600,000 (\$32,700,000 in 1907). The number of messages transmitted was 285 091, and the stations were \$4,738 (deficit of \$7,553,81,1907). The amployate

net income was \$4,738 (deficit of \$53,538 in 1907). The employés numbered 958.

# CONTRACTS OPEN and CLOSED.

Australia.—Melbourne.—May 18th. Four 250-k.v.a. three-phase transformers; 9,680 yards '05 sq. in., three-core, lead-covered cable, for the City Council. See "Official Notices" April 30th.

May 19th. Victorian Railways. Meters, coasting recorders or other energy-checking devices, for train operation on the multiplemit system, D.C., 1,500 volts. See "Official Notices" April 30th.

June 15th. City Council. Four mechanically-fired boilers, one turbine-driven boiler-feed pump, two fuel economisers, circulating water pumps. City Electrical Engineer. Specifications from Mesers. McIlwraith, McEacharn & Co., Ltd., London, E.C.

June 30th. Victorian Railway Commissioners. One 13-in.

centre lathe for turning or grinding commutators for traction armatures; one 9-kw. motor-generator and battery-charging accessories; four electric motors.*

SYDNEY.—June 16th. Deputy P.M.G. 400 Morse sounders, American pony pattern. (Schedule No. 449.)*

July 19th. Municipal Council. One or two 12,000-kw. turboalternators (Contract No. 363).* A copy of the specification can be obtained from the City Electrical Engineer. Sydney.

July 19th. Steel towers for 33,000-volt transmission line, Specification (10s. 6d.) at E.L. Department, Town Hall.

July 21st. N.S.W. Government Railways and Transmission.

July 21st. N.S.W. Government Railways and Tramways Department. One 250-K.V.A. turbo-generator.*

TOOWOOMBA.—June 7th. 480-volt D.C. electrically-driven centrifugal well-sinking pump, 30,000 gallons per hour, against a head of 200 ft, max. Deposit 2½ per cent. City Engineer.

Specifications for the items marked * can be seen at the B. of T. Commercial Intelligence Branch in London.

China.—Shanghai.—May 20th. 2,600 yards of threecore E.H.T. armoured cable, and 79 three-phase induction motors, for the Municipal Council. See "Official Notices" May 7th.

Darlington.—May 20th. Corporation. Cast-iron condenser water pipes. See "Official Notices" May 7th.

Dover.-May 18th. Six electric vehicles, for the T.C. 'Official Notices" May 7th.

Dublin.—May 25th. Corporation. Underfed stoker. See "Official Notices", to-day.

May 20th. Corporation. Supply of coal for the Electricity Department, &c., for one, two or three years, \$ 12 months' supply being approximately 40,000 tons, Copies of specification from the Town Clerk.

Finchley.—May 31st. U.D.C. Wiring, for light, 100 workmen's dwellings. See 'Official Notices' May 7th.

France.--The Administration des Chemins de fer de l'Etat, 43, Rue de Rome, Paris, will receive offers on Tuesdays and Fridays, from 3 to 5 p.m., for the following supplies:—Up to May 21st: six electric cranes (two of 60 tons, two of 40 tons, one of 25 and one of 20 tons); up to May 28th: six converter sets, a switchboard, and low-pressure mains.

Leeds. — May 26th. Corporation. Steam, feed and water pipes. See "Official Notices" May 7th.

Leigh (Lancs.).—May 21st. One vertical tube boiler, one 250 kw. rotary converter or motor converter, one switch panel, for the Borough Electricity Committee. See "Official Notices" April 30th.

Manchester.—June 2nd. Corporation. Coal-unloading crane, conveying plants, & y. See "Official Notices" May 7th.

May 18th. Tenders are invited for additions to accumulator

house and laundry at Baguley Sanatorium. Particulars from the City Architect (one guines, returnable).

May 19tb. The Guardians invite tenders for the conversion of the hydraulic lift at their infirmary into an electric lift. Specifications, &c. (10s. returnable), from Mr. A. J. Murgatoyd; 23, Strutt Street, Manchester.

Portsmouth. — June 1st. Corporation. 100 tons of steel girder tram rails, five tons of steel fishplates, one ton of fishplates, three tons of 5-ft. wrought-iron tie-bars. See "Official Notices" to day.

May 26th. Electric lighting, &c., at Girls' Hostel, for the Education Committee. See "Official Notices" to-day.

Rochdale.—May 17th. Steam coal, for the electric power station, Dane Street. Mr. C. C. Atchison, Engineer and Manager.

Sheffield.—May 28th. Two natural draught cooling towers complete. For the Electric Supply Department. See "Official Notices" May 7tb.

-The municipal authorities of Camporroble Spain. -(Province of Valencia) have just invited tenders for the concession for the electric lighting of the town during a period of two years.

Tasmania: Launceston. July 26th. Sub-station equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

Wigan. — May 29th. Corporation. н.т., three-core, paper and lead-covered, armoured feeder cable, transformer and switchgear. See "Official Notices" to-day.

#### CLOSED.

Aldershot.—The Electricity Committee recommends the acceptance of the following tenders for new plant :- C. A. Parsons, £3,858; Babcock & Wilcox, £1,115.

Bradford,—The Cleansing and Team Labour Committee has accepted the offer of the New Destructor Co., Ltd., to construct six cells and a combustion chamber, with multitubular boiler and all machinery and accessories (in lieu of existing 12 cells) for £2,977.

The Electricity Committee recommends the acceptance of the tender of the Brush Electrical Engineering Co., Ltd., for a 600-K.V.A. three-phase transformer, for the proposed electric supply to Dumb Mill, at £222; and the Tramways Committee that of Messrs. Hadfield's, Ltd. (£572), and Messrs. Edgar Allen & Co., Ltd. (£414), for points and crossings.

Burnley.—For the ensuing year the T.C. has accepted the tender of the British Thomson-Houston Co., Ltd., for motore, and that of Messre. Ferranti, Ltd., for starters.

Dundee.—The Corporation Electricity Committee recommends acceptance of the following tenders in connection with the new pumping station at Carolina Port:—

Pumping plans.—W. H. Allen, Sons & Co., Ltd.
Pipe line.—John Wilson, Ltd.
Reinforced concrete pumping room.—Yorkshire Hennebique Co., Ltd.

Holmfirth.—The U.D.C. has accepted the tender of Mr. Robert Turner, for the erection of the electricity generating

Hong-Kong.—The Hong-Kong Electric Co., Ltd., have placed contracts as follows for their new power station:—

Steel structural work, &c.—United States Steel Products Co. Boiler plant.—Babcock & Wilcox, Ltd. Cosl-bandling plant.—Babcock & Wilcox, Ltd. Tutho-alternators and switchhoard.—Bris. Thomson-Houston Co., Ltd,

- The Tramways Committee recommends Glasgow. . acceptances of the following tenders for six months :-

Steel axles, tires and wheels.—John Baker & Co., Ltd.; Glasgow Railway Engineering Co., Ltd.; Brown Bayley's Steel Works, Ltd.

For 12 months:-

Chilled-iron brake blocks.—Miller & Co., Ltd.
Fire clay goods.—Glenboig Union Fire-clay Co., Ltd.
Springs.—L. Sterne & Co., Ltd.; G. Turton, Platts & Co., Ltd.

The Electricity Committee recommends that the following offers for 12 months' supply be accepted :-

C.I. box se, sect on pillars, &c.—Carron Co.; W. Lucy & Co.; Faikirk Iron Co., Ltd.; M'Dowall, Stevens & Co.; Jas. Allan, sen, & Sons.
Fire-clay bricks and fire-clay.—Curaic & Co., Ltd.; John G. Stein & Co., Ltd.

Ltd.

Single cables, concentric and triple-concentric cables.—Callender's Cable Co., Ltd.

Extra B.T. cables.—W. T. Glover & Co., Ltd.

Extra B.T. cables.—W. T. Glover & Co., Ltd.

Rubber-covered cables.—Craigpark Electric Cable Co., Ltd.

F.exibles.—Wm. B.ckard, Ltd.

Arc lamp carbons.—C. W. Webster.

Electricity metors.—British Thomson-Houston Co., Ltd.; Ferranti, Ltd.;

Ohamberlain & Hookham, Ltd.

For six months :-

Wooden troughing cover.-Robinson, Dunn & Co., Ltd.

The Sewage Committee recommends that the offer (44,325) of the Ames Crosta Sanitary Engineering Co., Ltd., for the supply and erection of distributors in connection with the alterations at Dalmarnock sewage works be accepted, the company having agreed to equip the machines with electric motors in the event of failure of the water-wheel drive.

Leith.—The Corporation has accepted the tender of Messra. Siemens Bros. Dynamo Works, Ltd., for carbon-filament lamps for 12 months for the tramways.

(L.C.C.).—The Highways Committee has received the following tenders for cables in connection with the extension of the Woolwich train ways sub-station and a temporary supply of power for working the Council's tramways-

Estimate of chief officer of tramways £21,262. This estimate was prepared in March, but since that date the price of copper has materially advanced.

SOUTHWARK.—The following tenders for annual supplies have been recommended for acceptance by the B.C.:—

Cable —Sieme as Bras. & Ca., Ltd.

Meters. — Reason Manufa sturing Co., Ltd., five items; Electrical Apparatus Co., Ltd., five items; General Electric Co., Ltd., 12 items; Chamberlain & Hookham, Ltd., three items; Landis & Gyr, Ltd., three items;

Eleven tenders were rec ived for the cable and the same number for the meters. The tender of the BI. and Helsby Cables, Ltd., is also recommended for a feeder pillar for £50.

also recommended for a feeder pitter for 200.

In view of the prevailing conditions, and the satisfactory manner in which the contract has been carried out, the EL Committee has agreed to a request from Messrs. Hinchcliffe & Co., contractors for coal, to be paid an extra charge of 1s, per ton for wagon hire. This additional charge is on account of coal purchased in the open market carbide contract paids. market, outside contract prices.

PADDINGTON.—The Guardians have been recommended to accept the tender of Messra. S. Hammond & Co. to reinstate the telephone instruments, wires, &c., and keep the instruments under repair for a period of 12 months, for £36.

BATTERSEA.—The BC. Electricity Committee recommends the exceptance of the tenders of Mesers. Ferranti, Ltd., and Mesers. Chamberlain & Hookham, L.d., for the supply of meters during a period of 12 months.

Maidenhead.—The T.C. has accepted the tender of the Anglo-Mexican Petroleum Products Co., Ltd., for a year's supply of fuel oil for the Diesel engines at the electricity works, at £3 3.6d. per ton, the contract to be determined at the end of three months if the oil does not prove satisfactory.

Meter Contracts.—Messrs. Chamberlain & Hookham, Ltd., have received contracts for meters from Colwyn Bay and Elinburgh. Messrs. Venuer Time Switches, Ltd., have received a further repeat order from Cardiff for 99 time switches.

The Electrical Apparatus Co., Ltd., has received the following contracts: -

Bury St. Ellmunds. -Corporation. -Sole supply of 3 and 5-ampere meters; 12 months.
Leyton. -U.D.C. -D.C. meters; 12 months.
Woking. -The Electric Supply Co. -60 single-phase meters per annum during the next two years.

Newport (Mon.). - The Corporation Electricity and Tramways Committee has accepted the tenders of Messrs. James and Emmanuel, and Messrs. Partridge, Jones & Co., each for 1000 tons of coal, at 19s. per ton, subject to the electrical engineer endeavouring to obtain an option in favour of the Council to limit the order in each case to 750 tons.

North Ormesby. - Messrs. Clough, Smith & Co., Ltd., of London, have secured from the Grangetown, North Ormesby and South Bank Bailless Traction Co. the contract for the construction of their overhead equipment and feeder system (a route length of 5 miles 61 yards).

Rochdale. — The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for Wotan traction and standard lamps for the Corporation tramways, for the ensuing 12 months, has been

Salford.—The Electricity Committee has accepted an offer by Messrs. Andrew Knowles & Sons, Ltd., Pendlebury, to supply and deliver about 250 tons per week additional of Clifton Hall washed slack during a period of two months ending July 31st, at 15s. 4d. per ton.

Stretford.—The D.C. has accepted the tender of the General Electric Co., Ltd., for cable amounting to £670. The four 100-kw. sets at the generating station are to be disposed of by the Council at a price approximating to £325 each.

Stockport.—The T.C. on May 5th accepted the following tenders for the electricity works :-

Herbert Morris, Ltd.—40-ton orane £756, and gantry £119.
Stewarts & Lloyds, Ltd.—Steam piping for new turbine and boilers
£105 101., less 23 per cent.

Tonbridge.—The U.D.C. has accepted an offer by the Medway Coal Co. to supply before June 30th 200 tons of coal for the electricity works, at £1 2s. 9d. per ton, an advance of Sr. per ton on present prices.

Tunbridge Wells.—The T.C. has accepted the tender of Messrs. Baboook & Wilcox, Ltd., for supplying new steel sections and drums, with superheaters, to two boilers at the electricity works, at £1,289, with £50 for contingencies. The Council has also accepted the tender of Messrs. Witting & Partners for dismantling the existing cooling tower and building a new tower on the same site at £1,085. site, at £1.085.

West Ham.—A T.C. Committee recommends the acceptance of the tender of the British Thomson-Houston Co, for the supply of 160 motors required in connection with the alterations to the equipment of the tramears, together with the necessary gears, for £106 10s. each.

Winchester.—The T.C. has accepted the tender of Messrs. C. A. Parsons & Co., Ltd, for a 500 kw. turbo-generating set, with condensing plant and piping, at £3,991.

# FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, May 14th. At 8 pm. At Institution of Civil Engineers, Great George Street, Westminster. Paper on "The Distribution of Heast in the Cylinder of a Gas Engine," by Prof. A. H. Gibson and Mr. W. J. Walker.

Physical Society of London.—Friday, May 14th. At 8 p.m. At Imperial College of Science, South Kensington, S.W. Papers on "Precision Resistance Measurements with Simple Apparatus," by Mr. E. H. Rayner; "Some Novel Labratory Experiments," by Mr. F. W. Jordan, "On Electrically-Maintained Vibrations," by Mr. S. Butterworth.

Royal Institution of Great Britain.—Saturday, May 15th, and Tuesday, May 18th. At 3 p.m. At Albemarie Street, W. Lectures (i) and (II) on "Advances in the Study of Radio-Active Bodies," by Prof. F. Soddy.

Institution of Electrical Engineers (Newcastle Local Section).— Monday, May 17th. At 7.80 p.m. At Mining Lastitute. Annual General Meeting.

Sheffield Electrical Social Union.—Monday. May 17th. At 6.80 pm. At Stevenson's Restaurant, Castle Street. Tea and social. All electrical business men welcomed.

Foreign Trade. - THE APRIL FIGURES. - The following are the electrical and machinery figures given in the official returns for April:—

IMPORTS. Electrical goods and apparatus, excluding ma- chinery and un- insulated wire	Month of April. £ 90,143	Inc. or dec. £ - 33,515	Four months, 1915.	Inc. or dec. £ - 269,675
Machinery	877,806	+ 128,159	2,651,831	- 66,031
EXPORTS. Electrical goods and apparatus, excluding ma- chinery and un- insulated wire	238,899	<b>- 43,713</b>	959 <b>,632</b>	- 86,489
Machinery	1,574,455	-1,419,884	6,114,239	-6,870,048

# ELECTRICITY WORKS EXTENSIONS AT SOUTH SHIELDS.

DURING the last two or three years considerable extensions have been made to the plant installed at the South Shields Corporation Electricity Works, by the provision of turbine and rotary converter plant, also a new boiler house with water-tube boilers, bunkers, coal-handling

plant, &c., the cost of the additions being some £39,000.

Through the courtesy of Mr. Harry S. Ellis, the borough electrical engineer, we are able to briefly describe and illustrate this plant, which will no doubt largely supersede the McLaren marine type sets and marine type boilers which have been a feature of this station in the past.

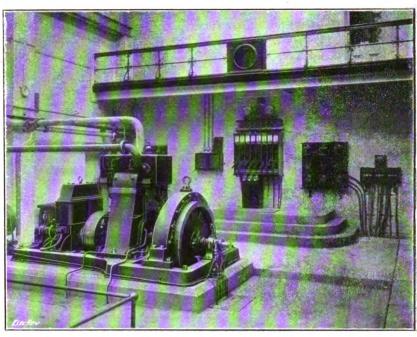

The South Shields undertaking was originally started in 1896, Mr. J. A. Jeckell being the first engineer, and two marine type boilers, two 100-kw. alternators coupled to marine type engines, and a small 15 KW. set, to take the day load, were provided; this plant has been added to until to-day some 5,800 kw. of plant is installed.

As regards the plant installed prior to the introduction of turbines and still available for use, what is known as the old boiler house contains six marine type boilers, three fitted with two furnaces and designed to evaporate 7,000 lb. of water per hour, and the other three fitted with three furnaces and designed to evaporate 11,000 lb. The coal used in these boilers is stored in a large brick walled bunker running

the full length of the boiler house and capable of containing about 600 tons. The firing is all carried out by hand, three stokers being necessary on the evening shift

when all the boilers are working.

The circulating water for the condensers is lifted from the River Tyne into large storage tanks, capable of containing about 100,000 gallons, by means of five Worthington steam pumps, each capable of delivering 33,000 gallons per hour

ORIGINAL FERRANTI SWITCHBOARD AND 15-KW. SET, INSTALLED IN 1896 AT SOUTH SHIELDS.

There is also a centrifugal pump coupled to a 50-B H.P. Westinghouse D.C. motor which is capable of delivering 150,000 gallons per hour against a total head of 50 ft.

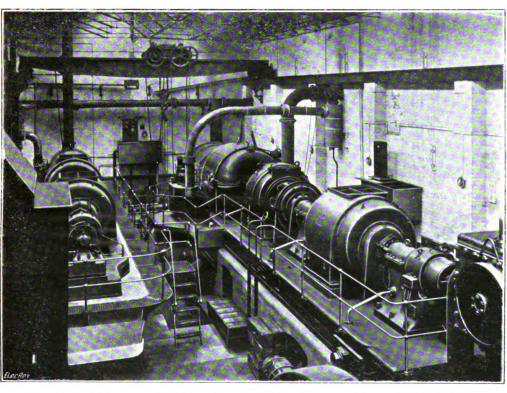

The engine room consists of two bays, each 100 ft. long,

and the smaller one now contains, in addition to the new turbine sets, only one of the old 200-kw. Ferranti single - phase alternator sets coupled to a marine type engineone 200 - KW. and two 100-kw. single-phase sets having been displaced to make room for the new plant.

The Ferranti cellular type single phase switchboard at one end of the bay consists of the original cells with additions.

The larger bay contains two McLaren 1,000-I H.P. engines driving 500 - KW. Siemens and Richardsons, Westgarth single-phase alternators and two similar 1,100-I.H.P. engines driving 550 - KW. Dick, Kerr direct-current machines, which were originally installed for supplying the tramways, but are now also used for supplying

energy to large power consumers. Working in conjunction with the direct-current supply there is a Tudor battery of 500-kw. capacity on a one hour rating, and an automatic reversible booster. New Generating Plant.—This consists of two Westing-

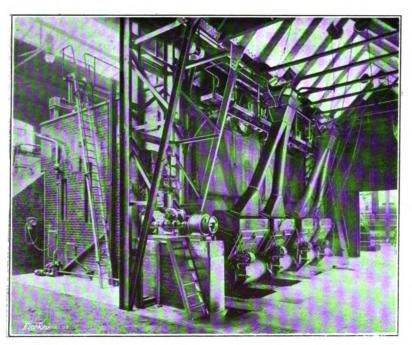

2,000 kw., 3,000 r.p.m., and 1,500-kw., 1,500 r.p.m. Turbine Sets Recently Installed at South Shields.

There are five steam pumps at one end of the boiler house, four for boiler feed and one for lifting the condensate from the hot-well tanks to a Harris-Anderson oil-eliminating plant.

Digitized by Google

house-Rateau high-pressure turbines of 1,500 and 2,000 kw. capacity respectively; the former is coupled to a 1,000-kw. 500/550-volt direct-current machine, fitted with a radial

NEW BOILERS, WITH CHAIN GRATES AND DUPLICATE MOTOR DRIVE.

commutator, and a 1,100-KW. single-phase 2,100 - volt 50 - cycle turbo-alternator, the two machines being in tandem and running at 1,500 R.P.M.

This set was installed in 1912 under the supervision of Mr. Ellis, but its installation was arranged for by his predecessor, the late Mr. J. H. Cawthra.

The second turbine, 1 ut into operation in 1914, drives two 1,500-KW. 2,100 - volt three - phase 50-cycle turbo-alternators and an exciter in tandem at 3,000 R.P.M.

The influence of high speed on the size of the later turbine is shown in our view, the higher powered set being much the smaller one.

Both turbines exhaust into Westinghouse - Le Blanc surface condensers, the air and extraction pumps for which are driven by a 30-H.P. D.C. motor. In the case of the three-phase machines, the arrangement of the switchgear allows of one phase being cut out, and the other two, in series, supplying single - phase The turbocurrent. generators are cooled by

forced air circulation, and, in connection with the latter, a Heenan rotary air filter, capable of dealing with 24,000 cb. ft. of air per minute, has been installed. This

apparatus is similar in construction to the same firm's water coolers, but the functions of air and water are reversed, and in this case the air, in addition to being filtered, is lowered in temperature 15° or 20° in hot weather.

Two 600-kw. Westinghouse rotary converters are installed in the power station to link up the 2,100-volt alternating and 500/550-volt direct-current supplies for traction and power purposes. The transformers, by the same firm, are of the oil insulated self-cooling type; the rotaries are each equipped with a starting motor and exciter, and are arranged for the self-synchronising method of starting.

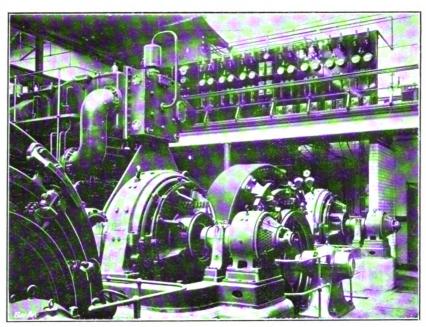

As regards the new boiler plant and coaling arrangements, coal is unloaded by a wharf crane into a hopper near the centre of the old bunkers; from the hopper it is carried by a belt conveyor, of 30 tons an hour capacity, to the overhead bunkers of the new boiler house, which have a capacity of 560 tons. Space for four boilers is at present available in the new building, which, however, can be increased in width to accommodate another four boilers.

Two Babcock & Wilcox land-type boilers, each of 5,346 sq. ft. heating surface and 22,000 lb. per hour evaporative capacity, are installed and working; these are fitted with

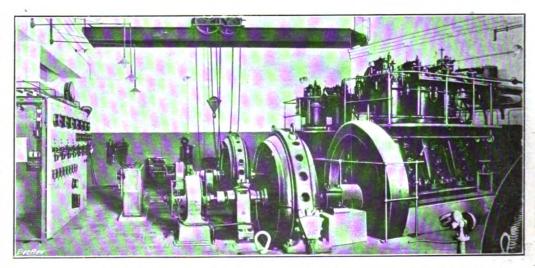

integral superheaters and chaingrate stokers.

In connection with this plant there is a Green economiser of 288 tubes, two Weir steam feed pumps, each of 7,500 gallons an hour capacity, and a Lassen & Hjort water-softening plant, capable of dealing with 24,000 gallons a day of town's water, which has an initial hardness of from 25° to 30°, and is used for boiler feed purposes.

The new boilers are operated under induced draught, the flue gases being discharged by Musgrave fans into a new steel chimney,

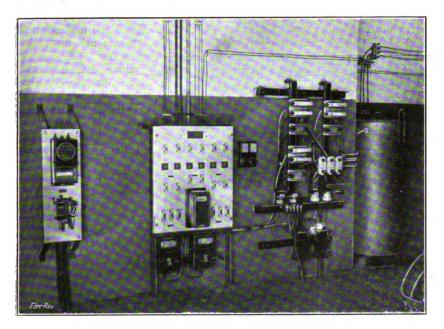

NEW ROTARY CONVERTERS, D.C. PLANT AND SWITCHBOARD, SOUTH SHIELDS.

THREE-PHASE DIESEL ELECTRIC PLANT AND SWITCHBOARD, AHMEDABAD, INDIA (see next page).

of the Thompson self-supporting type, 100 ft. high and 7 ft. 6 in. diameter. These fans, two in number, are flexibly coupled to Westinghouse variable speed 44-H P.

TRANSFORMER, L.T. AND AUXILIARY SWITCHGEAR.

motors (360-450 R P.M.), each fan being capable at the lower speed of handling the gases from two boilers, and pro-

ducing a draught of  $1\frac{1}{2}$  in. water gauge. At the higher speed, one fan would deal with the gases from three boilers, giving a  $2\frac{1}{4}-2\frac{1}{2}$  in. w.g. draught.

Arrangements have been made to augment the supply of circulating water during the present year by means of two 12-in. Worthington vertical centrifugal pumps, which are to be erected on the jetty, and will deliver to an overhead tank, the total head of the pumps varying between 51 ft. and 34 ft. 6 in., according to the state of the tide.

Each pump will

discharge 2,920 gallons: a minute, working submerged, and will be driven by a vertical spindle 73-H.P. D.C. motor, running at about 800 R.P.M.

OVERHEAD DISTRIBUTION, STREET LIGHTING, &C., AHMEDABAD.

The site of the recent extensions is on a hillside, and some 2,900 tons of spoil were removed to level the site. This work, together with the foundations, brickwork, &c.,

was carried out under the direction of the borough engineer, while the new plant was, of course, installed under the supervision of Mr. Ellis, the borough electrical engineer, to whom we are indebted for these particulars.

# ELECTRICITY SUPPLY AT AHMEDABAD, INDIA.

THE city of Ahmedabad, which is one of the most important in the Bombay Presidency, with a population of approximately 250,000, has now been provided with a modern electricity supply undertaking.

The company was floated by Messrs. Killick, Nixon and Co., Bombay, to whom the population of Gujarat is indebted for the advantages of railway communications in many of the outlying districts. The contractors were Messrs. Callender's Cable and Construction Co., who carried out the whole of the cable work, whilst Messrs. Crompton and Co. were the sub-contractors to them for the whole of the plant inside the generating station.

The buildings are constructed of brick, the roof being boarded with teak inside, and covered on the outside with

corrugated asbestos sheets.

The plant installed consists of three 150 - B.H.P. Diesel oil engines supplied by Messrs. Mirrlees, Bickerton and Day, each coupled to a threephase Cromptonalternator of 94-KW. capacity, and capable of developing its rated output at 3,000-3,300 volts, 50 cycles; each alternator has a direct-coupled exciter.

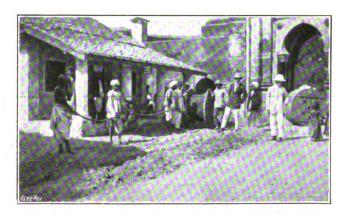

The starting air bottles for the engines are interconnected, enabling any set of bottles to be charged up from another set, or

an engine to be run off either set of bottles.

A 50-kw. 3-phase 3,000/3,300 to 400-voltstep-down transformer of the oil-cooled type is installed in the station, and

GENERATING STATION AND BUNGALOW.

LAYING H.T. CABLES, AHMEDABAD.

is provided with tappings and switchgear to enable the lowtension supply to be regulated to deal with an increased voltage on the bus-bars, to provide for pressure drop in the outgoing feeders.

Two Heenan & Froude water coolers are provided, each capable of dealing with the whole of the circulating water

from two 150-B.H.P. engines running together at full load; these are driven by 7-H.P. motors, and the temperature of the water is reduced about 20°. circulating water is taken from the town mains, and is supplied to the engines from a 1,500-gallon tank placed on the cooler house roof. A boiler of 5,000 gallons capacity has been provided for storing the oil fuel, which pumped from this to a 100gallon tank in the generating station, and distributed to the supply tanks of the engines. The oil

is supplied by the Anglo-Persian Oil Co., who have installed oil tanks near the city.

The high-tension switchboard is built of marble panels on a steel framework, with the H.T. gear behind, and the L.T. gear, which controls the L.T. side of the transformer and three outgoing distributors, on the front; an overhead 5-ton hand-crane has also been erected in the engine room. The

and '05, '05, '05, '025 sq. in. four-core, lead-covered, steel-tape armoured L.T. distributors.

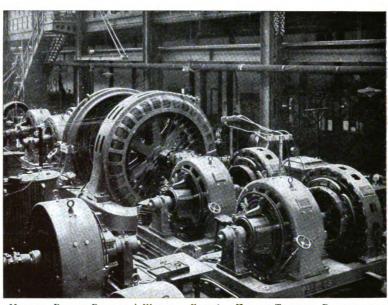

The distribution is carried out on the three-phase fourwire system, with 400 volts between phases and 230 volts between each phase and neutral, the neutral being earthed at the point of supply. Both overhead and underground

mains are used, the former consisting of three No. 6 s.w.g. and one No. 8 s.w.G. hard - drawn copper wires. A special safety device has been fitted, which consists of rings of bare copper wire earthed and fixed at a distance of 2 ft. from the insulators, through which each live wire passes, leaving a clearance of 3 in., so that should a live wire break it immediately comes in contact with the earthed ring, and is rendered harmless.

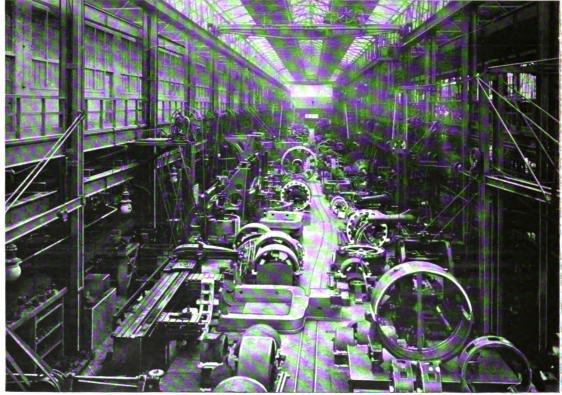

Where possible, overhead bare copper wire services are run to the consumers' premises, but many

consumers are being connected by means of lead-covered 4-core cable which is run along a row of buildings and tappings taken off; underground services are also in use in some places where the distribution cable is run underground.

An agreement has been entered into with the municipality to take a supply of electricity for street lighting for 15 years, the maintenance being carried out by the company.

MESSRS, BRUCE PEEBLES' WORKS. FIG. 1.—HEAVY TESTING DEPARTMENT (see p. 697).

MESSES, BRUCE PEEBLES' WORKS. FIG. 2.—MAIN BAY OF MACHINE SHOP (see p. 697).

H.T. transmission is carried out on the three-phase system, at 3,300 volts between phases, the cables being run to three transformer pillars in the town, two of which each contain one 25-kw. three-phase, 3,000/3,300 to 400 volt step-down transformer, and the third one a 50-kw. transformer of the same type. The underground cables in use are '025 sq. in. three-core, lead-covered, steel-tape armoured H.T. mains;

The wires are run on the distribution system poles, and the lamps, which are of 100 c.p. and 50 c.p., are fixed in water-tight brackets at a distance of approximately 12 ft. from the ground and 40 yards apart. These lamps are controlled from three cast-iron control pillars, and arrangements have been made for switching off or on one-half of the lamps; when required.

The present rates for the supply of electricity are 6 annas per unit for lighting and fans, and 2 annas per unit for power.

A considerable demand for electricity is expected from private residences, mosques, hospitals, flour and oil mills, offices, railway station yards, and fans, and for pumping purposes.

In conclusion, we are indebted to Mr. R. Forest Preston, engineer and manager to the Ahmedabad Electricity Co., Ltd., for enabling us to publish these particulars and views of an interesting plant.

# THE WORKS OF MESSRS. BRUCE PEEBLES AND CO., LTD.

THE name of Bruce Peebles at once suggests "motor-converters," owing to the great popularity achieved by these ingenious machines; but the output of the large works on the Firth of Forth is by no means confined to this class of apparatus, the firm's manufactures including A.C. and D.C. motors of powers from 1 to 3,000 H.P., and generators of various types, for driving by steam and hydraulic turbines, and steam and gas engines, up to 5,000 kw. Some particulars of the works are given in an illustrated brochure recently issued by the company, from which we reproduce the accompanying views (on page 696).

The site of the works covers 10 acres, and is provided with excellent facilities for the transport of goods by sea and land, the works being connected with the Caledonian Railway system, which passes the premises, by means of sidings on which electric locomotives run. An artesian

well provides a good supply of water.

The main building is 600 ft. long × 150 ft. wide, and is divided into five bays, of which the centre one (fig. 2) is devoted to the large machine tools and heavy erecting work. Power is supplied by a 500-kw. Peebles-Belliss set and a 250-kw. Peebles-Browett set, each engine driving two dynamos so as to feed a three-wire system at 230 and 460 volts, in conjunction with a Tudor storage battery. gas producer for heating purposes and air compressors for pneumatic tools are installed, and the works are well pro-vided with electric cranes and hydraulic hoists. Lighting is effected with metallic-filament lamps of high candle-power.

The heavy machine tools include a 20-H.P. planing machine, an 18-ft. side planer, and a 20-ft. boring mill, as well as a variety of smaller tools and automatic machine tools. Stamping and notching tools for accurate work up to the largest sizes of core plates are installed, and a special patented continuous process is employed for insulating and stoving the plates, which go into one end of an oven uninsulated and come out at the other end dry and ready for assembly.

The fitting and connecting-up of the windings are carried ont by a separate department, great care being devoted to this work. The winding department is divided into separate sections for D.C. armatures, A.C. rotors and A.C. stators; the larger machines, however, are wound at one end of the main bay, in order that they may be handled by the large travelling cranes.

Vacuum varnishing tanks are provided for impregnating the windings, together with drying ovens, which are fitted with doors opening into the main shop, so that the finished work need not be carried back through the varnishing room.

The foundry deals with castings of brass, gun-metal, aluminium, &c., and is also used for a patented process by which rings of special alloy are cast on the rotor conductors of the Peebles squirrel-cage induction motors, instead of riveted and soldered copper rings.

Testing departments are provided near the power house, but the heavier machines are tested in the main bay, under the cranes, as shown in fig. 1. In this view a number of Peebles-la Cour patent motor converters are shown, including the large set of 2,200 kw. for Manchester Corporation, which we illustrated in our issue of November 27th, 1914.

The offices are accommodated in a large building near the works, and exceptionally adequate provision is made elsewhere for the comfort of the employes, a large dining-room and kitchen being placed at their disposal, where excellent meals are supplied at low prices.

Needless to say, the firm are very busy with private orders as well as with Government work; they are somewhat handicapped by the scarcity of labour, some 150 of their employes having joined the Colours, but every effort is being made to cope with the demand.

## BRITISH INDUSTRIES FAIR.

THE Board of Trade British Industries Fair, which has been THE Board of Trade British Industries Fair, which has been organised by the Commercial Intelligence Branch of the Board as one part of the programme for assisting firms to capture enemy trade, was opened last Monday. Her Majesty the Queen, with whom we observed Mr. Runciman, Precident of the Board, Sir H. Llewell; n Smith, and prominent members of the striff who have taken an active part in organising the exhibition, made a tour of the Hall, and stopped at many stands to take an interest in particular exhibits. There are some 600 stands, and the exhibition, which has been arranged purely for trade buyers, will remain open until May 21st.

ticular exhibits. There are some 600 stands, and the exhibition, which has been arranged purely for trade buyers, will remain open until May 21st.

Invitations to Continental buyers were issued some time ago, and we understand that many of these, as well as some from Cauada, America, and other distant countries, have already visited the Fair. The trades to which it was found necessary to restrict the Fair are:—China, earthenware and glass, cutlery, electro plate, printing, stationary, jewellery (including drapers' jewellery and haberdashery), toys and games, and fancy goods—all trades in which a large proportion of the goods hitherto consumed in this country have been imported from abroad. All of the exhibiting firms are manufacturer, and they consequently, represent British industry more thoroughly than would be the case had factors and wholesale dealers been included in the total.

The support which manufacturers have given to the movement may be gathered from the fact that the 600 exhibitors have only been alletted space by considerably reducing the sites applied for in the majority of cases. The Board of Trade are endeavouring to assist buyers as far as possible, and interpreters have been engaged, special Inquiry Offices organised in each of the trade sections, and a branch of the Commercial Intelligence Branch of the Board of Trade established in the Hall, so that the fullest information on such matters as commercial statistics, Customs tariffs, shipping and transport, commercial products, and similar matters may be at the disposal of exhibitors and visitors. Any buyer who has not received a ticket and derires one should communicate at once with the Branch, at 32, Cheap: ide, E.C.

The following are among the exhibitors:—

#### NOTES.

Institution and Lecture Notes. — Institution of Electrical Engineers.—The report of the STUDENTS' SECTION for the past session shows that there have been six general meetings in London, nine at Manchester, and four at Newcastle. and social functions had been arranged at the close of last session, but owing to the outbreak of war it was found necessary to cancel but owing to the outbreak of war it was found necessary to cancer
the whole of the arrangements. It was not found possible to
commence the session in London until January, and since that date
a comewhat curtailed programme has had to be followed. The
Manchester Section was able to carry through a full ressional programme, and the Newcastle Section found it necessary to suspend
a portion of its programme. The Scottish Section decided to suspend all the meetings for this session on account of the depleted membership.

At the meeting of the YOBKSHIEE LOCAL SECTION, on Wednesday last, Mr. J. H. Rider's paper on "The Power Supply of the Central Mining-Band Mines Group," was read and discussed.

The Textile Institute.—Sir William Mather, of Messrs.
Mather & Platt, Ltd., Manchester, was elected President of the Textile Institute at the annual meeting in Manchester last Friday. He remarked that the double aspect of our duty at the present time was to beat the enemy at the front and to prepare for the future so as to avoid a fearful accumulation of debt and difficulty future so as to avoid a fearful accumulation of debt and difficulty that it might take a generation to overcome. The time had come when we must throw overboard all those old-fashioned notions of ours that England was a favoured nation by the grace of God, and that Englishmen had, as a birthright, a higher position in the world than the people of any other nation. England could improve on the past in many ways. What they needed to do was to bring the light of science and higher education to bear more than they had done they had done.

Institute of Marine Engineers.—The Hon. Secretary announces that the Institute has been removed from the premises in Rumford Road to those on Tower Hill, and all communications should therefore be addressed as follows:—The Secretary, the Institute of Marine Engineers, the Minories, Tower Hill, London, E.

Educational.—A new edition of the University College, "Pro Patria" is in course of preparation, and will be London. London, "Pro Patria" is in course of preparation, and will be issued shortly. Past and present students, or their relatives and friends on their behalf, are invited to send full particulars of the capacity in which they are serving the country at the present time. In the case of the Army, rank and regiment should be given; in the case of the Navy, rank and ship. These particulars should be addressed to the Publications Secretary, University College, London (Gower Street, W.C.).

GIFT TO SHEFFIELD UNIVERSITY.—The Times states that Six Learnh Longon chairman of the Applied Science Committee of

GIFT TO SHEFFIELD UNIVERSITY.—The Times states that Sir Joseph Jonas, chairman of the Applied Science Committee of the University of Sheffield, has given the University £5,000 to found, endow and equip a testing laboratory in connection with the Applied Science Department. The laboratory is to be equipped with the most modern applances for testing metals and minerals, especially those used in the production of steel, and is to be called the "Jonas Testing Laboratory."

Electrical "Evaporation."—Prof. Owen Richardson delivered the Friday evening discourse at the Royal Institution on May 7th, his subject having to do with the electron theory, to which he has devoted a great deal of special study. He pointed out that when electrified bodies were heated they lost their power of retaining an electric charge. The importance of this phenomenon was only just being realised, although the phenomenon itself had been known for a long time. Under certain conditions this ionic emission was positive in character, under others negative, and emission was positive in character, under others negative, and under others again, was both positive and negative. When, however, a metal was heated in a vacuum, like the filament in a lamp, it was found that under all conditions of temperature only negative charges were emitted; the heated filament gave off no positively electrified particles. Prof. Richardson went on to develop a theory that the emission of streams of electrons from heated metals was a process closely analogous to evaporation. It

seemed to him to be the electrical analogue of evaporation, or, to put it more simply and daringly, the actual evaporation of electricity. There were some remarkable parallels between the evaporatrion of a liquid and the emission of electrons from a lamp filament, and the lecturer proceeded to demonstrate experimentally that the electrons were able to fine against an opposing electric field, and in effect to jump a certain number of volts. There was a possibility that minute chemical products might be sufficient to account for the electrical effects in a large number of volts. cases. Fortunately however, there was one case in which it had been found possible to demonstrate electrical effects of this kind out of all proportion to the chemical effects. This was the instance in which the metal employed was tungsten, which could be heated in a tube for so long a time, and carried to so high a temperature, that all known impurities were eliminated, and, by using specially prepared tungsten lamps, it was shown conclusively that these effects were strictly electrical emissions, and were not to be explained on the ground of chemical action. In conclusion, Prof. B. chardson expressed his belief that these emissions of electrons from heated bodies were large enough to have very considerable practical importance in the future.

Stowmarket Explosion.—An explosion took place on STOWMATKET EXPLOSION.—An explosion took place on Monday last at a Stowmarket factory, resulting in the death of four men. At the inquest on Tuesday Major Aston Cooper Key, one of H.M. Chief Inspectors, advanced the view that one of the men, who wore rubber overshoes, had become charged with static electricity by friction with certain bags, and that a spark passing from his body to some earthed object had caused the explosion. To prevent a recurrence of the socient a metal stud would, in future he invested in the sole of the shoe so that the worker would future, be inserted in the sole of the shoe, so that the worker would always be earthed. No fatal accident had previously occurred at the factory since it was started, 17 years ago. The jury returned a verdict of "Accidental death."

British Electrical Trade in Belgium.—A Belgian correspondent now in this country, who has had 16 years in connection with the electrical industry, wants to assist in the defeat of German competition in B lgium after the war is over, and to help to encourage a large volume of British electrical trade there. He wishes to become the general representative for some English manufacturers of motors, dynamos, wire, cable, lamps (are and incandescent), dry batteries, &c. We shall be pleased to forward any communications that may be received addressed to "Belgian Correspondent," care of ELECTBICAL REVIEW.

Fatalities.—Owing to the heavy rainfall and the flood on the railway near West Kensington, last week, an employé of the District Co., named A. J. Lawrence, lost his life. The man, a gateman, in stepping from a train into the water received a severe electric shock and died an hour later.

At the inquest on Tuesday it was stated that the conductor warned Lawrence not to get into the water on account of the electric current, but later he did so. A passenger who jumped into the water to help him received a shock, but was able to rescue the deceased. Artificial respiration was tried for 2½ hours without success. The medical evidence showed that death was due to shock and not to drowning, and a verdict of accidental death was returned.

The Manchester Meeting of the B.A.—The meeting of the British Association will open on Tuesday, September 7th, and close on Saturday, September 11th.

Inquiries.—Makers of Mascolite pads for absorbing vibration are asked for.

# OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

('entral Station Officials.—The Wolverhampton T.C. has been recommended to increase the salaries of the undermentioned officials in the electricity department:—Mr. T. Smith, distribution engineer, from £245 to £270 a year: Mr. E. Forder, engine-room superintendent, £150 to £165; Mr. C. Bellhouse, boiler-house superintendent, £150 to £165; Mr. E. Stures, chief assistant, from £200 to £225; Mr. J. H. Rothwell, chief clerk, £170 and £185. The increases are to take effect as from April 184. last, with no further increases for four years as regards the chief assistant, distribution engineer, chief clerk, and for two years as regards the two superintendents.

The Newport (Mon.) Electricity and Tramways Committee has recommended that the salaries of Messes, E. G. Illingworth and C. B. Briggs, senior engineers in charge at the electricity works, be increased to £123 10s. per annum.

MR. A. B. ADAMS, draughtsman and general technical assistant at the Newport (Mon.) Corporation Electricity Works, has secured an appointment with Mesers. Gu s', Keen & Nettlefold, Ltd.
MR. R. S. Greege has resigned his position as assistant in the mains department of the Sheffield electricity undertaking.

Tramway Officials.-MR. C. BEECH, rolling stock superintendent in the Derby Corporation tramways department, has been appointed car-shed superintendent at Bolton, at £200 per annum. There were 93 applicants,

General.--After nearly six years in the East, during the last nine months of which he has been officiating as electrical inspector to the Government of Burma, Mr. HARRY W. NIMMS was to leave Rangoon for home by the ss. Leicestershire on April 39th.

MB. GEORGE HUTCHINSON, chief electrician of the Lusitania

interviewed at his home at Frodeham, Cheshire, stated that he had just given his life-belt to a young woman when he saw Mr. Vanderbilt struggling in the water. The millionaire's lifebelt was wrongly adjusted, and Hutchinson, who was treading water, tried to put it right, but could not. "I am Vanderbilt," the struggling man remarked to him. He did his best to keep both of them affoat,

but they drifted apart.

1

The Bacup Town Council recently accepted the resignation of MR. W. E. LLOYD, borough treasurer and manager of the electricity department, who has been appointed borough accountant of Hampstead, at a commencing salary of £450 per annum. The Mayor said that after Mr. Lloyd was appointed treasurer he was appointed manager of the electricity department, and received some additional salary for it, and they would probably proceed on similar lines in regard to a successor. Ald Maden said that as gards the electricity department, it had made rapid strides since

Mr. Lloyd went to Bscup.

On March 25th, at St. Augustine's Church, Doornfontein, Mr. J. H. Dobson, general manager of the gas, electric supply, and tramways department of the Johannesburg Corporation, was married to Miss Kathleen Florence Cherrington, third daughter of Major and Mrs. Cherrington. The ceremony was performed by Cauon Harrison Thompson. A reception followed at the County Club, 500 guests being present. Mr. and Mrs. Dibson were the recipients of many presents, including a massive silver punch bowl from the chief officials of the department, a grandfather's clock and silver fruit epergne from the staff and employés, a silver fruit stand and silver vases from the motormen and conductors, and a silver rose bowl and case of carvers from the traffic inspectors. The Mayor and Mayoress sent a silver tea service.

Obituary.—Dr. F. S. PEARSON.—We deeply regret to Obituary.—Dr. F. S. Pearson.—We deeply regret to record that Dr. F. S. Pearson, who was so prominently identified with a large number of important Mexican, Brazilian and European electrical undertakings, was among those who were lost in the Lusitania on Friday last. He had also brought his brilliant organising powers and financial knowledge to bear upon several non-electrical enterprises, but our readers will remember him as president of the Brazilian Traction, Light and Power Co., Rio de Janeiro Tramway, Light and Power Co., Mexican Light and Power Co., the Mexico Tramways, and the Barcelona Traction, Light and Power Co. He was a director of the Sao Paulo Tramway, Light and Power Co. and the Mexico Electric Tramways. As will be seen from a report appearing in our "City Notes," he was on his way to this country to attend a meeting of the Barcelona company mentioned above. mentioned above.

mentioned above.

Mr. Audley Drake.—We are also grieved to learn that amongst the Lusitania victims was Mr. Audley Drake, aged 24, the elder son of Mr. Bernard Drake, Copyhold, Cuckfield, Sussex, chairman of Drake & Gorham, Ltd., with whom widespread sympathy will be expressed by his friends in the electrical industry. Mr. Audley Drake was educated at Eton, and King's College, Cambridge, where brane was educated at Etch, and King & College, Cambridge, whether specialised in science. After four years at Cambridge he went last June to America to study an electrochemical process, which is being worked on a large scale near Detroit. Whilst there he obtained a responsible appointment with the United Alkali Co., of Liverpool, who are now putting down a large plant, having acquired the British rights for the above invention. Mr. Drake was to have returned later, but owing to the fact that the products were urgently wanted by the Government in connection with the manufacture of explosives, he received a cable to come back as quickly as possible, hence his unfortunate inclusion amongst those lost on the Lusitania. His father tells us that he had little hope from the first, as he was certain bi son would never leave the ship as long as there was anyone there to whom he could render assistance.

long as there was anyone there to whom he could render assistance.

MR. G. MAURICE.—It seems from what we hear that Mr. G.

Maurice, of the General Electric Co., Ltd., has likewise been lost in the Lusitania, but in the hope that there may yet be good news, we refrain from referring to the matter further this week.

The electrical world also suffered a further loss through this

infamous outrage of the enemy, Mr. Gorer, a director of Venner's Cookers, Ltd., being among the drowned.

Mr. H. F. Friedrichs,—The death occurred on Sunday night of Mr. H. F. Friedrichs, the borough electrical engineer at West Hartlepool. Mr. Friedrichs first went to West Hartlepool in 1889 as Sir Alex. B. W. Kennedy's representative in connection with the initiation of the Corporation electricity undertaking, and later was appointed borough electrical engineer, a position he has since His work in connection with the installation of the waste heat plant, by means of which the waste steam from the Seaton Carew blast furnaces is utilised for the generating of electric current, was specially valuable. Mr. Frederichs was 50 years of age, and was born at Penang, in the Malay Peninsula. He leaves a widow and five children.

MR. J. S. NAYLOR.—The death is notified, at the age of 7 of Mr. Jas. Smith Naylor, who was a director of the Keighley Electrical Engineering Co., Ltd., from its formation.

Mr. HARRY CROXON HAWKINS, for 25 years a member of the staff of Crompton & Co., Ltd., electrical engineers, died at his residence at Chelmsford on May 6:h, from cerebral hemorrhage. Deceased, who was 53 years of age, became the firm's chief accountant at both the Chelmsford and London offices.

The death is announced of MR. D. Fall, manager since its inauguration of the Portrush and Giant's Causeway Electric

Tramway,

### NEW COMPANIES REGISTERED.

Tyneside Alloys, Ltd. (140,245).—This company was registered on May 7th, with a capital of £10,000 in £1 shares, to carry on the business of extracting metals and their compounds from ores and other substances, making alloys of all kinds, including tungsten, molybdenum, vanadium, chromium, and ferro-alloys used in the manufacture of steel and other industries, manufacturing heavy and fine chemicals and enamelling, colouring, and dyeing substances, manufacturing treating, distilling and refining tars, coal tar products, and other substances, manufacturing and dealing with gases, extracting, refining, and hardening oils of all kinds, prospecting, mining, etc. The subscribers (with one share each) are: W. Jones, Ingleside, Gosforth, Newcastle-on-Tyne, metallurgist; A. Y. Jones, Netherhops, Gosforth, Newcastle-on-Tyne, metallurgist; A. Y. Jones, St. Bedes, East Boldon, brick manufacturer. D. S. Jones. Qualification, 100 shares. Remuneration as fixed by the company. The directors may borrow up to £10,000 without the sanction of a general meeting. Solicitors: Wilkinson and Marshall, 1, Mosley Street, Newcastle-on-Tyne.

Francis Podden and Co., Ltd. (140,231).—This company

Francis Polden and Co., Ltd. (140,231).—This company was registered on Nay 7th, with a capital of £5,000 in £1 shares, to carry on the business of electrical and mechanical engineers, manufacturers of machinery of all kinds, tool makers, founders, metal workers, etc., and to adopt an agreement with F. C. Polden. The subscribers are: F. C. Polden, 56, Cannon Street, E.C., electrical and mechanical engineer, 2,500 shares: C. J. Polden, 56, Cannon Street, E.C., electrical engineer, 10 shares. Private company. The number of directors is not to be less than two or more than five; the first are F. C. Polden (permanent chairman and managing director) and C. J. Polden. Qualification, £10. Registered office: 56, Cannon Street, E.C.

Anglo-Burmah Wolfram Syndicate, Ltd. (140,174).—This company was registered on May 4th, with a capital of £500 in £1 shares, to carry on the business of dealers in and treaters and smelters of wolfram ore, etc. The subscribbers (with one share each) are: E. Boundy, 5, Fenchurch Street, E.C., merchant; C. C. Nichols, Ocean House, 24 and 25, Great Tower Street, E.C., merchant.

Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Registered office: Ocean House, Great Tower Street, E.C.

# OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Autolectric Transmission, Ltd.—Debenture, dated April 16th, 1915, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: A. A. Knight, 2. Corlton Road, Ealing, W., and H. L. Mecatta, 39, Edwardes Square, Versienter

Jarrow and District Electric Traction Co., Ltd. (78.680).

Capital, £50.000 in £1 shares. Return dated March 15th, 1915. All shares taken up. £1 per share called up; £49,961 15s, paid (including £18 15s, paid on 55 shares forfeited), leaving £38 5s, in arrears. Mortgages and charges, £14.800

North-Eastern Electric Smelting Co., Ltd.—Mortgage, dated April 16th, 1915, to secure £6,250 any further moneys which may be advanced or become owing, charged on premises in Wallsend and the company's undertaking and property, present and future, including uncalled capital. Holder: Secretary of State for War.

Melton Mowbrav Electric Light Co., Ltd. (53,018).
Registered June 18th, 1897. Capital £25,000 in £5 shares. Return da March 19th. 1915. 4,000 shares taken up; £20,000 paid. Mortgages a charges, £19,500. Registered office: 35, Regent Street, Melton Mowbray.

Electric Zinc Co., Ltd. (127,838).—Capital. £2,000,000 in £1 shares (400,000 pref. and 1,600,000 ord.). Return dated December 31st, 1914. Seven shares taken up; nothing called up. Mortgages and charges: Nil.

G. H. Turner and Co., Ixtd.—Issue on April 21st, 1915, of £80 debentures, part of a series of which particulars have already been filed.

Newcastle and District Electric Lighting Co., Ltd. (28,022c).—Capital. £300,000 in £10 shares. Return dated March 19th, 1915. All shares taken up. £297,500 paid, leaving £2,500 in arrears. Mortgages and charges: £320,780.

Kensington and Knightsbridge Electric Lighting Co. Rensington and Ringrishriage Electric Liquing Co., Liu. (26.193).—Capital, £350,000 in £5 shares (50.000 ordinary, 10.000 1st pref. and 10.000 2nd pref.). Return dated March 18th, 1915. 21,000 ord., 10.000 1st pref., and 10.000 2nd pref. shares taken up. £5 per share called up on 15.998 ord., 10.000 1st pref., and 10.000 2nd pref. shares: £179.840 paid: £25.160 considered as paid on 5.032 ordinary shares. Mortrages and charges: £115.000. Stock issued by this company in conjunction with the Notting Hill Electric Co., Ltd., £231,000.

British L. M. Ericsson Manufacturing Co., Ltd. (79,061).

Capital, £200,000 in £1 shares (99,990 pref. and 100,010 ord.). Return dated March 31st, 1915. All shares taken up. £1 per share called up on 50,010 ord., 8s, per share on 50,000 ord., and £1 per share on 99,990 pref. shares; £170,000 naid; £30,000 (12s. per share) considered as paid on 50,000 ord. shares. Mortgages and charges: £50,000.

Mather and Platt, Ltd. (60.387).—Capital, £1,000,000 in 40.000 pref, shares of £10 each, and 600,000 ord, shares of £1 each. Return dated March 13th, 1915. All shares taken up. £10 per share called up on 29,200 pref, and £1 per share on 25,000 ord, shares; £317,000 paid; £683,000 considered as paid on the remainder. Mortgages and charges; Nil.

Hellvar and Sons, Ltd.—Second debenture, dated April 24th, 1915, to secure £100, charted on the company's undertaking and property, present and future, including uncalled capital, subject to prior debenture on which £436 remains owing. Holder: Mrs. K. F. Galton, 68, Church Road, Barnes.

of £5,000 debentures, created April 12th, 1915, filed pursuant to Section 33 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £400. Property charged: The company's undertaking and property present and future, including uncalled and unpaid capital. No trustees.

Oriental Telephone and Electric Co., Ltd.—A memoran-um of satisfaction to the extent of \$2,400 on April 14th, 1915, of deb, tock covered by trust deed dated Tune 98th, 1905, and a supplemental deed facknowledgment dated June 12th, 1907, securing \$200,000, has been filed.

British Electric Automatic Machines. Ltd.—Debenture and agreement in connection therewith, both dated April 12th, 1915, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Kleinwort, Sons & Co., 30, Fenchurch Street, E.C.

#### CITY NOTES.

# Barnsley and District Electric Traction Co., Ltd.

The report, submitted at the annual meeting held on Tuesday at the Electrical Federation Offices, W.C., showed that the revenue for the year was £27,586. After providing for all expenses chargeable to revenue, including £1,756 for debenture and loan interest, and setting aside £3,500 to the renewals account, there is a surplus, including £376 9s. 4d. brought forward, of £4,066. The dividend on the 6 per cent. preference there always the forward on the continuous share and the present of £4,066. ence shares absorbs £1,320, 6 per cent. on the ordinary share capital requires £1,202, and £1,544 is to be carried forward. The capital expenditure during the year was £7,520, mainly for additional motor omnibuses and further garage accommoda-

tion.

# British Thomson-Houston Co., Ltd.

MR. Geo. Franklin presided on Wednesday, at 83, Cannon Street, E.C., over the annual meeting of the company. The Chairman, in moving the adoption of the report, said it was so complete in the information about the company's affairs that only very little remained for him to say. The year past had been a most difficult one, and if they were able to put before the shareholders a satisfactory balance sheet, it was greatly due to the loyal and efficient way in which the whole of the staff had done their work; and, on behalf of the Board, he tendered to them, one and all, their most sincere thanks, feeling sure that the shareholders would join cordially in this sentiment. As mentioned in the report, a great many of their employés had joined His Majesty's Forces, and they had made suitable provision for their families during the time of their employes had joined His Majesty's Forces, and they had made suitable provision for their families during the time they were serving their King and country. With regard to the disposal of the net profit for the year, which showed an increase of about £11,000 over 1913, they had, after consultation and in agreement with the most important shareholders, decided to utilise the same as shown in the balance sheet, and thereby further strengthen the position of the company.

Mr. W. C. Lusk (manager, commercial department)

Mr. W. C. Lusk (manager, commercial departme seconded the motion, which was carried without discussion.

#### Callender's Cable and Construction Co., Ltd.

In their report for 1914, the directors state that the accounts show a balance at the credit of profit and loss of £98.692, plus £124,591 brought forward, making £223,284. Interest on debenture stock absorbs £13.500, dividend on preference shares £10,000, depreciation of buildings, plant and machinery £9,968, depreciation of office furniture £397, leaving an available belong of £120,410. It improved to the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the c \$3,968, depreciation of office furniture £397, leaving an available balance of £189,419. It is proposed to pay a dividend on the ordinary shares at the rate of 10 per cent. per annum, less income tax, being 10s. per share, whereof 5s., less income tax, was paid on November 2nd. 1914, and 5s., less income tax, will be paid on May 21st, 1915, to pay a bonus of 5s. per share, less income tax, and to carry forward £163,169. The directors consider this result to be satisfactory. It has been arrived at in spite of the disorganisation of business by the war during five months of the year, in which period operations were carried on with great difficulty and at considerably increased cost. All the departments of the company's factory were profitably engaged to their utmost capacity up to the end of July last, but on the declaration of war much of the business in hand was stopped, and it can easily be understood that the position thus created caused the gravest anxiety to the directors and management. Several of the contracts secured in the early part of the year were postponed, and the directors and management. Several of the contracts secured in the early part of the year were postponed, and others were only partially completed, but after three months' others were only partially completed, but after three months' uncertainty it was found possible to reorganise the factory to meet the altered conditions of the trade, with the result that the works at Erith are now busy in some of their departments and well occupied in the others. Considerable trouble has recently been experienced in regard to labour, and the situation still remains unsettled. The curtailment of facilities for transport by land and sea has added materially to the difficulties of satisfactory manufacture. Shortly after the outbreak of hostilities special orders of some importance were placed with the company by the Admiralty and the War Office. Owing to the re-arrangement of plant and machinery necessary to execute this work, comparatively little of it was completed at the expiration of 1914, and practically no profit has yet accrued to the company through these war contracts. As was inevitable with the widespread interests of the company, heavy expenses and great inconvenience were caused in conheavy expenses and great inconvenience were caused in connection with the oversea business hitherto carried on, but, considering the unprecedented circumstances, this trouble has been less than might reasonably have been anticipated. Every opportunity has been taken to extend the company's operations wherever possible, and the directors feel confident operations wherever possible, and the directors feel confident that, when peace is again restored and commerce has resumed its normal course. a large and increasing business may be looked for, not only in those countries in which the company is already established, but also in several new localities. Important contracts in connection with the British telephone system, to which reference was made in last year's report, were placed in this company's hands in the early part of the

year, and, in order to deal efficiently therewith, some expenditure on contract plant was incurred. The war has for the moment caused a suspension of all telephone extension, but this work will without doubt be resumed when the war has this work will without doubt be resumed when the war has ceased. As usual, all plant and appliances have been thoroughly maintained and kept up-to-date, and the expenses so incurred have been charged against the year's accounts. The Anchor Co., in which this company holds a large interest, has again had a prosperous year, and continuous progress is being made in the various electrical undertakings in which this company is concerned. The company hus arranged to make allowances to the dependents of its employés engaged on active service, and a new item therefore appears in the accounts. The and a new item therefore appears in the accounts. The amount for the current year will, however, be much larger than that shown in 1914, as the number of recipients is constantly increasing. Annual meeting: May 20th.

# Peterborough Electric Traction Co., Ltd.

The annual meeting was held on Tuesday at Electrical Federation Offices, W.C. The report submitted showed that the revenue for 1914 was £10,967. After deducting expenses, £8,608 16s. 10d., chargeable to revenue and debenture interest £945, there remains £1,413, plus £106 brought forward. £1,263 is to be applied to renewals fund, leaving £257 to be carried forward. £979 was expended on capital account during the year, mainly upon the purchase of motor omnibuses and on garage accommodation. Mr. R. J. Howley has been appointed a director of the company. a director of the company.

Amalgamated Wireless (Australasia), Ltd.—
The second report of the above company, covering the six months ended December 31st, was published in March in the Sydney Morning Herald. Satisfactory trading is reported, although certain departments have been much disturbed since the commencement of the war. The ships' message traffic, owing to censorship, naval restrictions, and the use of some of the subsidised-ships for Imperial purposes, has been reduced to a low ebb. The subsidy ships have slightly increased, and now stand at 80 passenger and cargo steamers. New business is periodically coming along. Since the outbreak of war over 70 men have been sent away to carry out naval and military work of various descriptions on the battlefields of Europe and Egypt, as well as on transports and special-service Government vessels. The net profit for the six months was £7,812, which, with £16 brought forward, makes £7,828 available. The directors recommend an interim dividend of 2½ per cent., absorbing £3,500, leaving £4,312 to be carried forward. Comparison of the six months with the 12 months ended June 30th, 1914, may be made thus:— Wireless (Australasia), Ltd. June 30th, 1914, may be made thus:

The number of consumers increased from 529 to 606. Mr. W. L. Madgen has resigned his seat on the board.

Anchor Cable Co., Ltd.—The directors report that the profit for 1914 amounted to £31,778, plus £15,850 brought forward. It is proposed to pay a dividend of 16 per cent., carrying forward £32,129.

Shawinigan Water and Power Co.—The Financial Times quotes an American paper to the effect that early in June this company will issue a new block of stock, the proceeds to be used to reimburse the treasury for additions made in the last year or so, and for additional working capital.

W. T. Glover & Co., Ltd.—A petition has been presented and will be heard before Mr. Justice Neville on May 21st, asking for alteration of the articles of association by adding various powers relating to the acquisition, holding and working of lead, copper, and coal mines, the smelting and working of ores, the production, refinement and treating of lead copper, &co., and many other metters. other matters.

# West Coast of America Telegraph Co., Ltd.

West Coast of America Telegraph Co., Ltd.

Sir J. Denison Pender, K.C.M.G., presided on May 11th over the annual meeting held at Electra House, E.C. He said that the revenue for the year had amounted to £61,129, an increase of £7,483. The working expenses, compared with those for 1913, showed a decrease of £4,532. Ship repairs to cables, a most important part of their expenses, were lower by £2,686, but, as he had so often pointed out, that was an item which at any time might be a heavy one. The future could not be foreseen, and all they hoped was that the repairs would be light, thus benefiting the expenses account. The cable had to be manufactured in England and sent out, so it was an expensive item, especially at the present time, and every repair, however small the fault might be, necessitated important expenditure on cable to rectify it. The duration of interruptions for 1914 was 112 days, against 97 days in the preceding year, and taking into account the state of things which existed in August and for some months afterwards, owing to the presence of German cruisers after the outbreak of war, that was very satisfactory, and it was due to a great extent to the vigilance of their staff on the coast that so little delay occurred in carrying out the repairs to their cables. A considerable part of the capital of the company was in stocks which matured at an early date, and therefore such provision must be made, if not to the full extent, as would enable the directors to deal with the financial position when the time came. That was the reason why they were unable to recommend any dividend on the ordinary capital this year; more especially as there was also a considerable depreciation in the value of the securities in the reserve fund. As they all knew, that depreciation was by no means confined to their company, but was universal, but it was all the heavier when the reserves were invested in gilt edge securities such as theirs' were.

Sir Albert J. Leppoc Cappel, K.C.I.E., seconded the motion, and the report was

# Rhondda Tramways Co., Ltd.

MR. L. B. Schlesinger presided, on May 6th, over the annual MR. L. B. SCHLESINGER presided, on May 6th, over the annual meeting, held at the offices, Lawrence Pountney Hill, E.C. In moving the adoption of the report, he said that the balance to the credit of the revenue account was £25,417. From this figure various items had to be deducted, including debenture interest, £11,470; sinking fund, £2,930; and rent to the Rhondda Council, which left a balance of £8,190; and that together with the sum brought forward, gave them £8,783. After giving effect to the directors' recommendation to increase the reserve and renewals account by £2,000, bringing that account up to £16,000, there remained a balance of £6,783 to be carried forward. This sum was more than sufficient to pay the full year's preference dividend, but the directors did not recommend any distribution. Three causes had cient to pay the full year's preference dividend, but the directors did not recommend any distribution. Three causes had contributed to that decision. In the first place, there was the decreased receipts, amounting to £1,430; secondly, the anticipated increase in expenses due to the extra wages for employes and the increased cost of materials; and the third reason was the fact that the expenditure of £17,000 on the railless system had proved, for the first time, non-revenue producing. The railless system was approved by the Board of Trade and opened for traffic in December last, but the services had to be suspended in March owing to the state of the roads. The matter was receiving the attention of the road authority, who were asking the Local Government Board to sanction a loan for the purpose of reconstructing the roads. It had not been ascertained whether the application had been successful, but they anticipated that the necessary sanction authority, who were asking the Local Government Board to sanction a loan for the purpose of reconstructing the roads. It had not been ascertained whether the application had been successful, but they anticipated that the necessary sanction would be obtained. An important factor was the want of travelling facilities in the colliery district, and this was a matter which might prove an inducement to sanctioning the loan. The company had obtained the consent of the Local Government Board to the issue of its remaining debentures. Until the outbreak of war, the undertaking had been quite satisfactory, and there had been an increase in the receipts of £2,014. But it had since decreased to £702. The company had been affected more so than other places. A large number of men, estimated at 17,000, had left Rhondda to join the Forces, and that had naturally affected the receipts. The passing of the dividend was a matter of great regret to the directors, but they felt, in view of the facts, that the shareholders would agree it was the wisest course. Turning to the accounts, the Chairman said the share capital remained the same as last year. The debenture capital now stood at £228,000, as against £231,000, a further £3,200 having been redeemed. A further £10,000 debentures had been issued. The reserves and renewals fund stood at £14,000, as compared with £10,000, and there had been added £2,000 recommended by the directors out of the year's profits. The special loan of £2,000 had been paid. The sundry creditors amounted to £7,107, as against £6,412. On the credit side, the capital account had been increased by a few pounds. The discount on the debentures was £15,000, as compared with £18,000. The extensions to date, including the railless trolley system, amounted to £16,645. With regard to the revenue account, the principle item was the traffic expenses, which were £13,530, compared with £12,632. The wages of conductors and other little items showed an increase. The net cost of the current was arrived at by deducting from th

tenance had entailed an expenditure of £10,001, as against £7,488, an increase due to capital expended on the permanent way and mains. That item would always be a considerable £7,488, an increase due to capital expended on the permanent way and mains. That item would always be a considerable one, owing to the heavy rainfalls and the mining character of the district. On the credit side, the revenue account showed an increase of £876 on the traffic receipts, of which £740 was attributable to the trolley system. In conclusion, the Chairman paid a warm tribute to Mr. Holliday, the new manager, who took up his duties last May.

The report, which was adopted, stated that there was no doubt that when the war was over the company could look forward to a return of prosperity owing to the continued development in the coal-mining industry.

The annual meeting of the Rhondda Tramways Electric Supply Co., Ltd., followed, Mr. L. B. Schlesinger again presiding. The proceedings were purely formal. The report, which was adopted, stated that, under an agreement dated August 6th, 1907, the Rhondda Tramways Co., Ltd., agreed to take from the company all current for the working of the tramways during the period of the lease—namely, 42 years—in consideration of which the Tramways Co. has the control and management of the undertaking, and is responsible for all working expenses, debenture interest and premiums on the sinking fund policies for the redemption of the debentures. The Rhondda Tramways Co., Ltd., is entitled to all profits made, and, in accordance with this arrangement, the profit of £2,000 to the credit of the revenue account has been transferred to the Tramways Co. ferred to the Tramways Co.

# Eastern Extension, Australasia and China Telegraph Co., Ltd.

The annual meeting was held on May 11th, at Electra House, E.C., Sir J. Wolfe Barry, K.C.B., presiding.

The Charrman, in proposing the adoption of the report, said that the gross receipts amounted to £819,000, against £738,000 for 1913, showing an increase of £81,000. This satisfactory result was partly due to their having had to transmit the whole of the Australasian traffic for nearly two months, when the Government Pacific cable system was interrupted by the attack made upon the Fanning station by the German cruiser Nurnberg, on September 7th last. The working and other expenses amounted in round numbers to £379,000, against £365,000 in 1913, showing an increase of £14,000. The net profit for the past year was, roundly, £411,000, and, including £30,000 brought forward, there remained an available balance of a little over £441,000. The usual quarterly interim dividends of 2s. 6d. per share each had already been paid for the past year, and it was now proposed to distribute a like amount, making a total dividend of 5 per cent. for 1914. It was also proposed to pay a bonus of 4s. per share, or 2 per cent, making a total distribution to the shareholders, free of income tax, of 7 per cent. for the past year, and to carry forward £31,000, against £30,000 for 1913. After making the usual additions to the maintenance, ships', insurance, and depreciation funds, £200,000 had been transferred from the revenue balance to the general reserve fund. On the other hand, the fund had been debited during the past year with £273,000—for the balance of cost of the Penang-Singapore-Hongkong cables £194,000, for partial cable renewals £35,000, for loss incurred on the sale of investments during the year £44,000. Those operations depleted the general reserve fund by £73,000, and left it at the end of the year at £656,000. When he last addressed the shareholders he indicated that the loss created by the sale of investments during the past year would be deducted from the provision shown in the balance sheet of addressed the shareholders he indicated that the loss created by the sale of investments during the past year would be deducted from the provision shown in the balance sheet of £200,000 for investment fluctuations, but, seeing that the war had very materially affected the value of all classes of investments, the directors had considered it to be a wiser policy to charge the whole loss against the general reserve fund, and leave the £200,000 intact. The reserve fund investments had been carefully re-valued on the basis of the official prices quoted at the end of last year and on March 31st last, from which it was found that the provision already made was sufficient to cover the existing depreciation. With regard generally to the changed conditions brought about by the war, the shareholders would readily understand that with their extensive able system, and their repairing steamers having to move about in waters more or less frequented by hostile vessels. cable system, and their repairing steamers having to move about in waters more or less frequented by hostile vessels, the directors and the staff had necessarily had an anxious and somewhat difficult time since the conflict began. Their chief duty and endeavour had naturally been to efficiently maintain telegraphic communication, and although they had had a good deal of repairing work to carry out from time to time, they had, so far, been fortunate enough to be able to carry on the traffic without a single interruption of any

Digitized by Google

importance. This, of course, was mainly due to the associated companies having so many different cable routes to the chief centres of commerce, and possessing a large fleet of cable steamers and other repairing facilities. The shareholders would not, however, be surprised to learn that considerable dislocation in the traffic arrangements had been caused by the war, especially in the early days before the altered conditions were fully established and provided for, but the directors had done everything in their power to meet the requirements and minimise the inconvenience caused to the telegraphing public by the new situation, while, at the same time, fulfilling their duties to the State. They were doubtless aware that under the landing licences controlling the relations between the cable companies and the governments concerned, governments, in time of war, had the right to take possession of the companies' offices and control the traffic. This right was exercised by the British Government on Sunday, August 2nd last, and, on the following day, the transmission of all public code and cipher telegrams was suspended, and the public were only allowed to send their telegrams in plain French or English language at full rates. Seeing that Government telegrams were entitled to precedence over all the companies' cables, and keeping open the lines of communication for the transmission of this class of traffic was a matter of the first importance, it was decided to suspend the transmission of deferred and week-end telegrams to enable them to provide as efficient a commercial service as was possible under the altered circumstances. Nevertheless, considerable delay resulted in the minimise the inconvenience caused to the telegraphing public a commercial service as was possible under the altered circumstances. Nevertheless, considerable delay resulted in the transmission of public telegrams, and the telegraphing public complained of the inconvenience, and also of the additional expense which they were consequently incurring. For some years past the associated companies had been in favour of charging for plain language telegrams exchanged with extracturopean countries by grouping the letters so as to count ten to each word, but, although at one time they hoped to be able to carry this innovation, at the last Telegraphic Conference held at Lisbon, the proposal was not officially sanctioned. With a view, however, to assist in meeting the war requirements, it was thought that an arrangement of this kind might be introduced, and thus relieve the public from having to pay ments, it was thought that an arrangement of this kind might be introduced, and thus relieve the public from having to pay full rates for plain language messages, and, after entering upon negotiations on the subject, the ten-letter system of counting was introduced on September 23rd. Some of the Colonial Governments, however, found objections to the arrangement, and, after the system had been in operation for a few weeks and was giving satisfaction to the telegraphing public, it was withdrawn, while, as an alternative, coding was again allowed to be introduced with certain limitations. On October 1st the Eastern and Eastern Extension Companies found themselves in the position of being able to resume the On October 1st the Eastern and Eastern Extension Companies found themselves in the position of being able to resume the transmission of deferred messages. The financial result to the telegraphing public of the ten-letter counting, while it lasted, was that they were charged about one-half of the ordinary rates, or about the same as for deferred telegrams, and the associated companies had done everything in their power to quicken the transmission of the deferred telegrams, in order that the public might have a good and trustworthy service on these favourable terms. The companies were unable, as yet, to resume the acceptance of week-end telegrams. as yet, to resume the acceptance of week-end telegrams, owing to the necessity of keeping the lines free to meet eventualities, but the telegraphing public might rest assured that, as soon as it was possible—with due regard to the prompt transmission of Government and ordinary commercial telegrams—week-end telegrams would again be accepted for transtransmission of Government and ordinary commercial telegrams—week-end telegrams would again be accepted for transmission over Eastern cables. Having regard to the heavy traffic which they had at times to transmit, it was very fortunate that the new cables laid by the Eastern and Eastern Extension Companies between Suez and Hong-Kong, via Colombo, were completed and opened for traffic before the outbreak of war. The shareholders would be interested to learn that they arranged some time ago for the free transmission over their lines of messages sent by Government departments relating to the killed and wounded amongst the British Empire Forces, and also for the acceptance at quarter rates of telegrams exchanged between soldiers, sailors, or nurses of the Expeditionary Forces and their relatives in different parts of the world. As the shareholders were aware from the graphic accounts given in the newspapers at the time of the occurrence, the company's Cocos station suffered considerable damage from the attack made upon it, on November 9th last, by the notorious German cruiser Emden. Knowing that hostile vessels were actively at work in the Far Eastern waters, they had taken the precaution soon after the outbreak of war to prepare the staff for all centingencies. Consequently, when the Emden suddenly appeared off the islands in the early morning of November 9th, the staff were on the alert, and, before the landing party could reach the station, they had communicated by cable with the naval authorities as arranged, and also sent out wireless signals in the hope that they would be picked up by one of the British warships believed to be in the neighbourhood. Fortunately, the Australian Contingent, with its convoys, was passing not far off the station at the time and, picking up the signals, the naval officer in charge at once dispatched the Australian cruiser Sydney with all speed to engage the enemy. The result was that the Fmden was attacked before the landing force was able to finish its work of destruction, and, af Government. The Admiralty presented handsome gold watches,

suitably inscribed, to the superintendent who was responsible for sending out the wireless signals, and to the company's doctor, who helped to succour the Emden's wounded. Appreciative letters had also been received from the Colonial Office and from the Committee of Lloyd's complimenting the staff on their action. The directors lost no time in conveying to the staff at Cocos the board's appreciation of their services, together with the marks of approval of the Admiralty, Colonial Office, and Lloyd's Committee. The shareholders would be pleased to learn that although the landing party entirely destroyed the instrument room, with its working apparatus, by axes, the Cocos station was able, thanks to the arrangements previously organised and the efficiency and energy of the staff under their trying ordeal, to resume working within 24 hours of the Emden's raid. This raid might easily have been attended with serious loss of life, but he was thankful to be able to say that no personal injury was inflicted on the Cocos staff. Unhappily, a very different state of things resulted from the deplorable mutiny that broke out at Singapore in February last, when, among the killed and wounded, three valued members of their staff, together with the wife of one of them, were murdered, and two others seriously wounded. The directors had expressed their sympathy and appreciation of the services of the Singapore staff, and he was sure that it would be endorsed by the meeting. Before concluding, he wished to record his appreciation of the patriotic devotion and the high sense of duty shown by the staff on shore and afloat in all parts of their system, and also at the head office, during a time of such great anxiety to them all. The ships' staff had done valuable work in maintaining communication, sometimes under trying and risky conditions; and the shore staff had dealt with the traffic as expeditiously as possible under the conditions of censorship imposed by the Government. They had been working long hours on week-days, Sundays, an suitably inscribed, to the superintendent who was responsible for sending out the wireless signals, and to the company's doctor, who helped to succour the Emden's wounded. Appresately spared were anowed to enist, and their places were not only being kept open for them, but they were at present being granted full pay. It would also interest them to know that two of the directors, the Hon. George Peel and the Hon. Arthur Brodrick, had been serving with His Majesty's Forces since the outbreak of war.

Sir John Denison Pender, K.C.M.G., seconded the motion, and the report was adopted.

and the report was adopted.

# Barcelona Traction, Light and Power Co., Ltd.

A meeting of the holders of the 5 per cent. bonds of the above company was held on Wednesday, at the Cannon Street

A meeting of the holders of the 5 per cent. bonds of the above company was held on Wednesday, at the Cannon Street Hotel, for the purpose of considering a series of resolutions to alter the trust deed in certain particulars in order to raise funds to carry out the uncompleted work of the undertaking.

Mr. W. E. Rundle, general manager of the National Trust Co. of Canada, who occupied the chair, said that among the passengers carried to their death by the sinking of the Lusitania was Dr. F. S. Pearson, the President of the Barcelona Traction Co. Dr. Pearson had been over to America, where he had succeeded in placing a large amount of the prior lien bonds which it was proposed to issue, and he was coming over to England expressly for the purpose of attending the meeting. His loss was deeply regretted by all who had been brought into contact with him, either in personal or business relations. Proceeding to deal with the business of the meeting, the Chairman said his company occupied an entirely independent position in the matter. They were not financially interested in the Barcelona Co., but, as trustees for the bondholders, they were very much interested in anything that was done that might affect their security or their interests. The committee which had been at work for some time had prepared a report, copies of which had been circulated, and after a careful and exhaustive study of the proposals made by the committee he had no hesitation in recommending their acceptance to the bondholders. The report of the committee was committee he had no hesitation in recommending their acceptance to the bondholders. The report of the committee was largely based on the report of Dr. Parshall, who emphasised

largely based on the report of Dr. Parshall, who emphasised the fact that the company's undertaking was in an uncompleted state and that it was of paramount importance that the enterprise should be carried through to completion.

Dr. Parshall, then formally moved a series of resolutions to give effect to the report of the committee.

Replying to a bondholder, Mr. E. R. Peacock, a member of the committee, said that it had not been found possible at the present, at all events, to locate the company in England. One of the reasons which weighed very heavily with them in coming to that decision was the fact that of the £8,000,000 of bonds outstanding, more than half were held on the Continent, and a further very substantial amount was held in Canada. Those bondholders would naturally not be prepared to support a scheme which would locate the company in England, and so make its earnings subject to the present heavy income tax.

heavy income tax.

The resolutions were carried unamimously.

General Electric Co., U.S.A.—The report for 1914 shows gross income of \$90,467,692, against \$106,477,439 for 1913. Costs, which include expenses of development, manufacturing, selling, administration and patents, and also depreciation in factory and plants, amounted to \$81,496,728, against \$96 207,834. Profit from sales amounted to \$8,970,963, against \$10,269,605. Total infrom sales amounted to \$8,970,963, against \$10,269.605. Total income was \$11,855,383, against \$14,065,789. Net profit amounted to \$11,287,827, which is equal to 11'12 per cent. earned on \$101,485,700 capital, as against \$13,489,357; which is equal to 13'2 per cent. earned on \$101,381,200 in 1913. Surplus, after dividends had been paid, was \$3,145,000, as against \$5,340,153. The directors state that, while there was a decrease of about 25 per cent. in the value of orders received, the total number of transactions was practically that of the previous year. The unfavourable relation between the number of orders and their value, characteristic of periods of depression, has operated to increase materially the cost of securing and handling business.—Finzncial Times.

Stock Exchange Notice. — The Committee has been seked to allow the following securities to be quoted in the Official

Calcutta Electric Supply Corporation, Ltd.—Further issue of 6,230 ordinary shares of £5 each, fully paid, and 3,780 ordinary shares of £5 each, £4 paid (within Nos. 250,001 to 160,000); and 6,808 5 per cent. cum. pref. shares of £5 each, £4 paid (within Nos. 200,001 to 210,000).

Gell Telegraphic Appliances Syndicate, Ltd.-Mr. Gell Telegraphic Appliances Syndicate, Ltd.—Mr. Justice Astbury, in the Chancery Division on Tuesday (May 11th), on the petition of Gell Telegraphic Appliances Syndicate, Ltd., confirmed the reduction of capital of the company by cancelling 10s. of the £1 shares. Counsel for the company said the capital was £40,000, of which £37,700 was issued. That would be reduced by £18,850, the amount of capital lost. The object of the company was to acquire certain patents for a machine in connection with sending telegraphic messages, and a great deal of money was spent in experimental work. Further patents had been taken out. There was evidence of the loss.

# STOCKS AND SHARES.

te Tuesday Evening.

EVERY class of the community has been deeply stirred by the unspeakable infamies perpetrated so rapidly one on top of the other by the enemy within the short space of one week. The Stock Exchange, of course, has shared to the full the horror which thrilled the civilised world at the latest revelations of German burbarity. In Capel Court, business came to something like a standstill. Stock Exchange men clamoured for immediate action to be taken by their Committee, for turning out of the markets those members who, although naturalised, have Germany or Austria as their fatherland; and the Committee, genuinely alarmed for the bodily safety of those naturalised members, sent them a strong warning not to enter the markets at present.

alarmed for the bodily safety of those naturalised members, sent them a strong warning not to enter the markets at present.

A slight demonstration, unduly megnified by most of the newspapers, occurred on Saturday morning, when, for the first time since the war started, the Stock Exchange partially lost its mental equilibrium and became a shade hysterical in its burning indignation at the murder launched at the Lusitania. The last few business days have been completely overcast by the shadow of this tragedy; the immediate effect upon prices was comparatively small, but the springs of investment and speculation have been forced and husiness marched to a halt.

smail, but the springs of investment and speculation have been freeze, and business marched to a halt.

Prices gave way not from any selling that took place, but by reason of the numbness produced by the all-prevailing cause.

Markets are, in a sense, asphyxiated by the poisonous gas of such wanton wickedness. A few quotations are a little lower, but Telegraph issues as a whole are firm, and, amongst industrials in the product of the prices of the product of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of the prices of t improvements have occurred in Edison & Swan fully paid shares and in General Electric Preference.

and in General Electric Preference.

In calculating the yields derivable at the present time from certain Telegraph and other stocks, the dividends on which are paid free of income-tax, we have hitherto based the returns upon the dividends as though they were paid in the ordinary way—that is, less tax. To do this, however, seems scarcely fair; and, accordingly, we have amended our list in such cases as those where companies distribute their dividends free of tax. To put the matter clearly: it is obvious that a dividend of 8 per cent less where companies distribute their dividends free of tax. It put he matter clearly: it is obvious that a dividend of 8 per cent. less 2s. 6d. in the £ for income-tax, really amounts to a net return of 7 per cent. to the shareholder, and therefore 7 per cent. free of tax is precisely equal to 8 per cent. less the deduction. It will be noticed that the yields on Eastern Extensions, Eastern Telegraph Ordinary, Globes and Western Telegraphs are enhanced in no small Ordinary, Globes and western letegraphs are enhanced in no small degree by this recalculation, which we have made simply in order to bring the comparative figures into their correct perspective when viewed alongside other securities. Our method of working the sum is to take the yield in the ordinary way, and then to multiply it by eight and divide by seven, because the income-tax is now  $12\frac{1}{2}$  per cent. -28. 6d. in the £.

There is a steady demand for the Eastern Telegraph group, and Western Ordinary have improved to 13\frac{3}{4}. Last week's substantial rises in Great Northerns and Indo Europeans have been well held, but the Anglo-American issues are slightly lower in sympathy with the prevailing sentiment elsewhere, which affected acutely the market in railroad shares in New York, although its effects were shorter-lived than those in the London market. One or two of the South American Telephone shares were a little easier; and Marconis slipped back to 33s. 9d., Canadians being 5s. 3d. and

Americans 10s, 3d. The American Company has just issued its Americans 10s, 3d. The American Company has just issued its report, in which it is stated that the company's ship and shore equipments are 20 times greater than those of three years ago. No dividend is paid, but a surplus of \$150,000 is carried forward. The Eastern Telegraph report shows good progress, and the net profit of £752,000 (after all deductions) is £73,000 higher than that of a year ago.

The West African Telegraph is paying 4 per cent. for the year.

There is little or no market in the company's shares. West African charge are supposed to be some cent. for the year. There is little or no market in the company's share:

West Coast of America shares are supposed to be somewhere about 53., as against 20: when war broke out. The board have decided not to pay a dividend, because of the necessity for making a provision of £10,000 against depreciation in investments.

The 4 per cent. Departures, gravanteed by the Western Telegraph. The 4 per cent. Debentures, guaranteed by the Western Telegraph Company, stand about 93.

The Home Rail market shows an amount of firmness rather surprising in the circumstances. There are buyers about of Central London stocks, and the Underground group as a whole is very steady. Income bonds fell a point, and in this case also it will be noticed that we have corrected the yield in the same way as indicated above, because the interest on these bonds is paid free of tax. The Bill which has been prepared for authorising closer working agreement between the City and South London, the Distriot, Central London, London Electric and London General Omni-

triot, Central Lindon, London Electric and Lindon General Omnibus Companies, is being discussed with languid interest, and is expected to meet with a certain amount of opposition.

Mexico issues, as a whole, are better, and a rise of 10 points carried Mexico Trams to 40, the Company's 6 per cent. bonds at 37 being 2 points up. Mexican Light and Power shares are steady, but the First Binds are a point digher at 51, and the prevailing impression appears to be that the worst of the Mexican trouble has been surmounted, with the future showing at least a gleam of possibility that matters may yet straighten out. The same subdued optimism has been felt so frequently on former occasions that its revival leaves one rather cold, although we suppose that in the mere nature of things the day will dawn when Mexico is once more at peace, and her people free to pursue commerce and once more at pasce, and her people free to pursue commerce and in lustry. Meanwhile, the attempt made upon the life of the present provisional President of the Republic, Senor Reque Gorzales Garza, has not looked as though the revolution had been settled, and an all-round decline in Mexican Railway stocks shows how the outlook is regarded in other quarters.

Brazil Tractions have gone back a little to 55, though the Rio exuhange keeps pretty steady at 12\$1. There is little doing in the shares at the moment, Auglo-Argentine Tramways 5 per cent. Debenture stock has hardened to 90½, at which the yield of £5 103, 6d. per cent. still looks tempting. Calcutta Electric Supply Ordinary shares improved to 6½ on the issue of the report this works about a profit for the user of £12,500. this week, showing an increased profit for the year of £13,500. The final dividend of 5½ per cent. makes 9 per cent. for the year, the same as for 1913; and the carry-forward of £11,500 is £4,000 better than it was 12 months ago. Calcutta Tramways stand at 6½, but they are ex dividend, whereas the Supply shares are cur.

In the Industrial market, Edison & Swan fully-paid shares have recovered to 2, a rise of 5s., and this is the principal alteration on recovered to 2, a rise of 5s., and this is the principal alteration on the week. Callender's are firm at 12, on the issue of the report, which states that all the departments of the campany's factory were profitably engaged to their utmost capacity up to the end of last July, but on the declaration of war much of the business in hand was stopped. Roorganisation of the factory to meet altered conditions of trade has resulted in some of the departments now being busy, while others are well occupied. The Admiralty and War Office placed special orders with the company shortly after the outbreak of hostilities. The directors state that the war has for the moment caused a superspice of all telephone extensions. for the moment caused a suspension of all telephone extensions, but that this work will without doubt be resumed when the war has ceased. Rubber shares are quiet, with a dullish tendency in some of the leading issues, and not much business in progress. Nor is there any further activity amongst armament shares, prices keeping just steady.

Wellingborough Electric Supply Co., Ltd.—The annual meeting was held on Monday at Electrical Federation Officer, W.C.—The report showed that the total capital expenditure at December, 1914, was £32.522. The total revenue was £3,493, and the working expenses £2,475, leaving £1,018. After providing £141 for interest on loans, and £334 for debenture interest, there is a surplus of £543, which reduces the balance at the debit of net revenue account to £567. The units sold were 358,459, as compared with 340,581 in 1913.

### MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and they may vary according to quantities and other circumstances.

Wednesday, May 12th.

Lewes and District Electric Supply Co., Ltd.—
The capital expended during 1914 was £388, making the total £34,163. The revenue was £4,068, and the expenses were £2,410, leaving £1,659. To renewals fund £600 is placed, to reserve £200, 2 per cent. is paid on the ordinary shares, and £199 is to be carried forward. The demand for energy for lighting and power continues to increase satisfactorily. The number of installations connected has increased from 419 to 448. The units sold aggregated 279 048, as compared to 248,408 in 1913. The annual meeting was held at Electrical Federation Offices, W.C., on Monday.

Yorkshire (Woollen District) Tramways, Ltd.—The annual meeting was held at Electrical Federation Offices on Tuesday. The report, to which we referred briefly last week, showed that the capital expended during 1914 was £3,378, making the total £338,735. The passengers carried, with the same route mileage, cars and omnibuses, was 11,003,293 in 1913, and 11,532,764 in 1914. The proportion of expenses to receipts remained unaltered at 61 per cent.

12

# THE POWER SUPPLY OF THE CENTRAL MINING-RAND MINES GROUP.

By J. H. RIDER, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, April 15th, 1915.)

# (Continued from page 672.)

The most general form of depth indicator used on winders on the Rand is the dial pattern. The dials are usually about 5 ft. in diameter, and are mounted on high cast-iron pillars facing the driver's platform.

When the old steam winders were converted to electric driving the original depth indicators were kept in use, and the electrical instruments, being of a small size, had to be mounted on or close to the driver's platform so that they could readily be seen

the electrical instruments, being of a small size, had to be mounted on or close to the driver's platform so that they could readily be seen.

It appeared to the author that it was a wrong principle to make the driver have to watch two sets of indicators, one mechanical and one electrical, in such different positions and at such different distances, and that the eye strain must be detrimental. He therefore endeavoured to bring all the indicators to one place, at a distance of about 6 ft. in front of the driver, and decided to use a depth indicator of the dial pattern, of the type in which the pointer moves through a very wide angle, covering at least 1½ turns, in a circular path of constantly and regularly increasing (or decreasing) radii. So far as he is aware this type was first designed and used by Mr. Roberts, of Knights Central, Ltd., Germiston.

The final arrangement is shown in fig. 6, from which it will be seen that the electrical instruments and the air pressure gauge for the brakes are mounted between the two dials. The indicator pointer is carried in a rectangular groove at the front end of the pointer spindle, and is guided in its circular motion by a small roller on the underside, which engages in a roller path formed in the depth of the dial face. A small screen is fixed at the outer end of the pointer, which covers up the markings on the inner ring when the pointer is indicating on the outer ring.

The dials are of only 27 in. diameter, and the end of each

ing on the outer ring.

The dials are of only 27 in. diameter, and the end of each pointer can move through a total path of about 116 in. This, with only an 8-ft. diameter drum, will serve for a depth of 2,900 ft., on the basis of 1 in. of movement for each revolution of the drum.

The complete indicator set is mounted on two pillars immediately in front of the driver's platform, with the tops of the dials at a height of about 4 ft. above the platform level. The driver is thus able easily to see over the top, to watch the drum marks, ropes, etc., when necessary.

The driving spindles for the dials are connected by gearing to the drums in the weak way.

to the drums in the usual way.

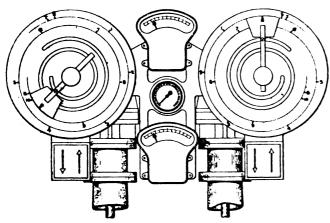

Fig. 6.—Combined Indicators for Electric Winders.

Immediately beneath each dial in fig. 6 will be noticed a small square box, with two arrows on the front side. Each box is divided into two vertical compartments, with an incandescent lamp inside each. The arrows are stencil cut through the cover, each right-hand arrow being covered by red glass and each left-hand arrow by green glass. A small control switch is connected to the operating lever, so that when the skip in the left-hand shaft compartment is being raised (and the skip in the right-hand compartment being lowered), the right-hand arrow (red) under the left-hand dial, and the left-hand arrow (green) under the right-hand dial are illuminated. hand arrow (green) under the right-hand dial are illuminated. The reverse action takes place when the skip in the right-hand shaft compartment is being raised. The driver has therefore an instant indication as to which skip is being raised, and follows the movements of that dial indicator pointer which has the red arrow under it.

Next to winding the most important duty of the electric

Next to winding, the most important duty of the electric motor on a mine is probably that of underground pumping. Motor-driven geared ram pumps for heads up to between

2,000 and 3,000 ft. were the common practice until 1912, when, on the advice of the engineers of the group, it was decided to use high-speed, multi-stage centrifugal pumps, with direct-coupled motors, at the South Rand shaft of the Crown Mines, Ltd., and at No. 1 Shaft, Durban Roodepoort Deep, Ltd. Each plant consists at present of two pumping units, each of which comprises a high- and low-pressure 8-stage Sulzer pump, with the motor arranged between the two pumps, and lifts 375 gallons of water per minute to a height of 2,400 ft. The sets run at 1,470 R.P.M. and take about 500 R.H.P.

A little trouble was experienced at first owing to the nature

A little trouble was experienced at first owing to the nature of the water, which was slightly acid and contained a large amount of finely-powdered rock in suspension. A scheme of settling sumps was then arranged, in which the acidity of the water is removed by lime treatment and the suspended matter is allowed to settle. Since these sumps have been provided the plant has worked with great success, and is now being extended.

The importance of reliable underground mining pumps, and particularly of the electric supply to the motors of such pumps, cannot be over-estimated. A stoppage of less than 24 hours would be sufficient in some cases to flood the lower levels of the mines, which would not only drown out the pump chambers, but involve bailing in the shafts by means of tubs and the winding plant before the pump chambers could again be entered. For the lowest level of the South Rand Shaft of Crown Mines, Ltd., the pump motors will be operated at 200 volts from oil-immersed transformers, and the rotors will be of the squirrel-cage type. They will be started with the primary windings of the transformers connected in star, which will be changed over to thesh connection when full speed is reached. The object of this is to render the motors less liable to breakdown should the pump chamber become flooded. There will be no switches between the transformers and the motors. and the motors.

and the motors.

The other classes of pumps used on the mines are generally electrically driven by belts. Nearly all the motors are of the slip-ring type, in which the rings are short-circuited and the brushes lifted at full speed. Belt driving has been found to have many advantages over direct coupling, as the pumps are often in positions, such as pits which are liable to be flooded, where a motor could not be placed, and, owing to the increases in the reduction plants from time to time, it is very convenient to be able to alter the speeds and lifts of the pumps merely

where a motor could not be placed, and, owing to the increases in the reduction plants from time to time, it is very convenient to be able to alter the speeds and lifts of the pumps merely by altering the sizes of the pulleys.

The stamp mill is a feature of all gold mines. The Californian type of stamp is in universal use; it consists of a circular steel weight, about 9 in. diameter, and 4 ft. long, fixed at the lower end of a steel rod called the "stem." The rod and its stamp are lifted by means of a cam, which, by rotating, engages on the underside of a tappet on the stem, lifts it for a distance of about 8 inches, and then allows the whole to fall by gravity on to a steel block at the bottom. Double-armed cams are employed, and the stamps are generally set in blocks of five or ten, and worked from a common cam shaft, the cams being arranged so that the stamps fall, one after the other, in a regular sequence. The ore is fed with water under the stamps, which weigh from 1,200 to 2,000 lb. each.

The cam shafts of the different stamp groups are driven by belts. Each stamp requires 5 H.P. on the average. The whole of the work is done by the motors in lifting the stampe, and is therefore the same whether any rock is being crushed or not.

is therefore the same whether any rock is being crushed or not.

The cams are double armed, and therefore the cam shafts revolve at only 49 R.P.M. This is a low speed and entails the use of a countershaft to enable a standard motor to be used. The largest pulled which is practicable on the cam shaft is of 7 ft. 2 in. diameter, and even with this the belt speed is only 1,100 ft. per minute. Very wide belts have to be used, with a jockey pulley to keep them tight, owing to the nearly vertical drive. Between the motor and the countershaft a belt speed of 2,630 ft, per minute is obtained.

Although the existing form of stamp mill is such a crude device and has apparently so many engineering defects, it has survived and will continue, because of its extreme simplicity and consequent reliability.

The modern practice is to crush to a moderate fineness only in the stamp mill and to complete the process in tube mills. By this means the output capacity of the plant is considerably increased and a much finer product is obtained.

A tube mill takes a considerable amount of energy to start it rotating, as the whole of the weight of the material lies at the bottom. It is also very sensitive to overloading, and many tube mill motors have been burnt out from this cause. Motors of 100 H.P. have been generally used, but these are gradually being replaced by motors of 125 H.P. and 150 H.P. for this reason.

A number of attempts have been made to drive tube mills

reason.

A number of attempts have been made to drive tube mills by direct gearing from the motor shaft, but, so far as the Rand is concerned, with no great success. Motors running at 365 R.P.M. were used, with "Citroen" single-reduction gears, consisting of a pinion on the motor shaft and a spur rim bolted on the outside of the tube mill at one end. The gear ratio was about 13 to 1. The end movements of the tube mill were sufficient to do away with all the benefits of the high-class gears, and even with a flexible motor coupling caused great gear wears and trouble at the motors.

The present standard practice is to use a motor running at

585 R.P.M., to belt this to a pulley on a pinion shaft running at 120 R.P.M., and to use straight toothed gearing with a ratio of about 4.3 to 1. The mechanical efficiency may be slightly less, but the commercial efficiency is decidedly greater. Four of the mines in the group do not obtain their supply of compressed air from the air mains of the power company, but use electrically-driven compressors on their own property. The rope-driven compressors are all of the horizontal 2-stage type, and in each case have been converted from steam driving by removing the steam pistons and replacing the flywheel by a rope pulley, on to which the motor drives. The direct-coupled compressors are, with one exception, of Messrs. Belliss & Morcom's standard vertical 2-stage pattern.

Intercoolers are used between the different stages of all the

Belliss & Morcom's standard vertical 2-stage pattern. Intercoolers are used between the different stages of all the compressors. The driving is by 3-phase constant-speed motors. The Belliss compressors were purchased under efficiency guarantees, and it is interesting to note that their testing was the means of converting the makers from their practice of stating the output on calculations, to the more accurate method of actually measuring the output. The difference shown by the two methods, as the result of tests, was that the measured efficiencies were about 10 per cent. below those guaranteed. The volume of free air (at atmospheric pressure) delivered by reciprocating compressors is generally not more than 88.5 per cent. of the piston displacement, and is very often less. Calculations from indicator cards generally show from 99 to 95 per cent.

from 99 to 95 per cent.

The power company bears the whole cost of operating the above compressor plants, including the electrical energy, and the mines pay for the air through meters in the ordinary way.

Small electrically-driven compressors, of capacities from 3 to 5 lb. of air per min., are used in conjunction with the brake gears of the electric winders, as stand-bys in the event of failure of the power company's air supply. They are hardly ever used.

ever used.

Electric power is employed underground for hauling the broken ore from the stopes to the ore bins adjacent to the shafts, both by main and tail rope haulages and by electric locomotives. The former are operated by fixed 3-phase motors and the latter from overhead wires.

Main and tail and continuous rope haulages are used on the surface to convey the ore to the mills, the sands and waste rock to the dumps, etc. Belt conveyors are also frequently employed. The application of electric motors to these services presents no special features.

The only difficulty in using motors for driving crushers is caused by the great amount of fine dust which always accompanies dry crushing operations. Even though the motors are generally placed in separate houses, the dust manages to find its way through the necessary belt and shaft openings, and in time seriously chokes the ventilating passages of the motors time seriously chokes the ventilating passages of the motors and gets into the bearings.

and gets into the bearings.

The work of the crushers is very variable and intermittent, and the R.M.S. loading of the motors is very low, when a separate motor is used for each crusher. Notwithstanding this, it is better practice to use a separate motor for each crusher than one larger motor for several crushers, as it not infrequently happens that the maximum crusher loads occur at the same time. There are not enough crushers employed at the individual stations to give anything like a levelling-out at the individual stations to give anything like a levelling-out of the load.

As a rule all motors of 50 H.P. and below are wound for 525 volts, and all motors above 50 H.P. for 2,100 volts. Those below 15 H.P. are of the squirrel-cage type, and those above of

the slip-ring type.

The small squirrel-cage motors are started by switching the stator directly on to the mains. In the future it is intended to use motors with squirrel-cage rotors for much larger sizes, and these will be started by means of compensator transformation.

The slip-ring motors use a water tank with three dipping plates in the rotor circuit for starting purposes. The stator is switched directly on to the mains with the plates raised, and they are then gradually lowered until they are short-circuited at the tank. The rings are then short-circuited on the motor and the brushes raised. The usual short-circuiting arrangement is generally so defective that in many cases it has been removed, and the motor run with the brushes always down on the clippings. on the slip-rings.

on the slip-rings.

In order to avoid a high pressure across the slip-rings on starting up, either a small (high value) resistance is connected between the dipping plates, or the level of the liquid is so arranged that the tips of the plates are always immersed.

Maximum-current and no-volt trip coils are used on the oil switches of all slip-ring motors, and of larger squirrel-cage motors which are started by compensators. For small squirrel-cage motors, which are self-starting when the stator is switched on fuses only are used. is switched on, fuses only are used.

(To be continued.)

# DISCUSSION AT BIRMINGHAM.

Mr. N. B. Rosher said the paper differed from most others, in that it admitted that there had been troubles and failures of the plant. The author was to be commended for having made these admissions; it was from records of failure and troubles experienced that frequently most was to be learned. Some rather astonishing particulars were given of bad design and workmanship in the plant installed. It would be interesting

to know where the plant was made: he would be surprised to hear that it came from this country. When he was in Cape Cclony some years ago a large proportion of the electrical apparatus was purchased from the United States on account of the exceedingly low freights by comparison with those quoted for goods from Europe. As regarded British products, he could not agree with the author that filmsiness of design was the usual characteristic of three-phase motor brush gear. Neither did he believe that it would be easy to find British-made motors in which the stator frames became distorted under load, or in which a 6-ft. rotor had a radial air gap of only 1 mm., a more usual figure being at least double that amount. With regard to the author's formula for minimum radial air-gap, it would appear that the figure obtained by this formula for the 6 ft. diameter rotor was cutting it rather fine. A rough approximation for the air gap, which he had found to agree very closely with the gap as measured on a large number of motors of various makes and sizes, was to take the gap as being 1/500 of the rotor diameter. This formula gave rather too large a gap for motors having rotors of such large diameters as the one in question. He would ask the author why the drills were not electrically operated, as was being done with success in this country, instead of by compressed air. The efficiency of a compressed-air system did not as a rule exceed 30 per cent., whereas the efficiency of the electric system might be taken at 80 per cent. Assuming that compressed air must be retained for blowing out the workings, would it not on the whole be more advantageous to install electrically-driven compressors at each mine?

Dr. C. Gabrard said there was no doubt that for large power consumers the system of having three separate meters in series was a very good one. He asked whether each was provided with its own current and potential transformers. With regard to fig. 5, it appeared to him that this diagram had a very serious fault in that should

With regard to fig. 5, it appeared to him that this diagram had a very serious fault in that should the apparatus go wrong in any way, warning was not given, and an accident might happen. For example, a break in the battery connection would prevent the warning hooter sounding. Any such apparatus should be so constructed that in the event of its going wrong it gave the danger signal and prevented an accident. Mr. Rider took up the thorny subject of the alleged inability or unwillingness of manufacturers to supply what the customer wanted. He trusted Mr. Rider would not think he was referring to him when he said that in the majority of cases the manufacturer knew very much better what the customer should have than the customer did himself. This was only to be expected, as the manufacturer devoted his life to manufacturing, say, a particular article and knew everything about it from A to Z; whereas probably the purchaser had a superficial acquaintance with the article in question. The fine art of salesmanship, of course, was to conceal this fact and, while letting the customer believe he was getting what he asked for, to sell him what he should have. In this way future trouble was avoided which, if it did occur, the manufacturer was bound to get blamed for, whether it was his fault or not. The very fact that these disputes could occur showed the great need which existed for an increased standardisation of electrical apparatus. The state of manufacture of electrical oil switches was at the present time quite chaotic. Mr. Rider apparently had specified a rating of 800 amps. 15,000 volts for his 2,000-volt switches. This, however, was quite an arbitrary figure. The Verband Deutscher Elektrotechniker about a year ago laid down a rule that the rating of an oil switch must correspond to the maximum current which it would have to break on short circuit in the situation where it was used. This was undoubtedly right.

Mr. F. Greenhaloh asked, with reference to the operation of oil-immersed stator switches or liquid control

This was undoubtedly right.

Mr. F. Greenhald asked, with reference to the operation of oil-immersed stator switches or liquid controllers, if the plain butt-contact switches which had been used to such a large extent, had withstood arcing satisfactorily, and whether they required much more attention than the open type carbon-break switches illustrated in fig. 4. While the liquid controller gave a particularly smooth acceleration, serious objection appeared to be taken to the manual labour required to operate it. Had Mr. Rider had any experience with the type of liquid controller in which the dippers were lowered into the water by a float in a small chamber controlled by a gate valve, which could be adjusted to give any depth of immersion in somewhat the same manner as that adopted in the standard liquid winding controller? Several of these controllers were already employed on small mine hoists in this country, and they would appear to have largely overcome the objection referred to, as the volume of water to be handled was much smaller than in the other case.

Mr. J. M. Walshe said that in referring to the tests of the motor-driven air compressors the author gave figures showing a discrepancy of 10 per cent. between the maker's guarantee and the results of a test on site. The larger part of the difference he considered to be due to the method of estimating the output of air. The efficiency stated was so much lower than was usually obtained with this class of compressor that he doubted very much whether the method used was reliable on those particular tests.

Dr. M. L. Kahn said that in view of the unique experience of Mr. Rider with three-phase induction motors used for main and tail haulage gears, he was particularly interested in his remarks about this point. The three-phase winders were compared with winders controlled on the Ward Leonard system.

^{*} See Elec. Rev. January 2nd and 16th, 1914.-EDs.

The latter required for each winder an induction motor, a direct-current generator, and a direct-current motor. The last two machines introduced two large commutators into the working of the system. The haulage gears as installed in most mines on the Rand only employed slip-ring-type induction motors, which offered advantages in cost of installation and in maintenance, and reduced the possibility of trouble by decreasing the number of units required. In spite of this apparent simplicity, Mr. Rider seemed to favour the Ward Leonard system, apparently due to the fact that in the Ward Leonard system the whole speed control was effected by shunt regulation, while in the single-motor system, large weirs of liquid starters had to be moved by hand.

Dr. Karp said a debt of gratitude was owed to Mr. Rider for having given so eminently practical a paper; but this feeling of satisfaction was overshadowed with a feeling of uneasiness when they read of the failures recorded, not unavoidable failures, but failures due to dishonest work. That any firm should send out faulty work patched up so as to hide the faults was bad enough, but that the work should be sent knowingly to a place where the lives of men depended on honest work was nothing short of scandalous. The author had not disclosed the makers' names! but he would be glad The latter required for each winder an induction motor, a direct-

A torsional test of 8 twists in 6 in., and a wrapping test of six times round its own diameter unwrapped and rewrapped.

wrapped.

For jointing up on the site a twisted-sleeve mechanical joint is used, which is made by passing the two ends of the conductors in opposite directions through a copper sleeve, then clamping the wires and sleeve together with two clamps and rotating the clamps in opposite directions until the joint is made in several complete twists.

The conductors are spaced 10 ft. 6 in. apart, and in the case of the intermediate towers are arranged delta fashion on either side of the tower, suspended on 6-unit insulators. In the case of the anchor towers the conductors are arranged vertically on either side of the tower and are suspended on 6-unit insulators. For the creek-crossing towers 7-unit insulators are used, the conductors being arranged vertically over one another on either side.

are used, the conductors being arranged vertically over one another on either side.

The suspension insulators (fig. 25), which are 10 in. in diameter, are of two types, viz., of the metal hooded type with ball joints for using vertically on intermediate towers, and of the link type for using horizontally on anchor towers. They are made from the best-grade non-absorbent porcelain, highly vitreous, of uniform hard glaze, dark grey in colour,

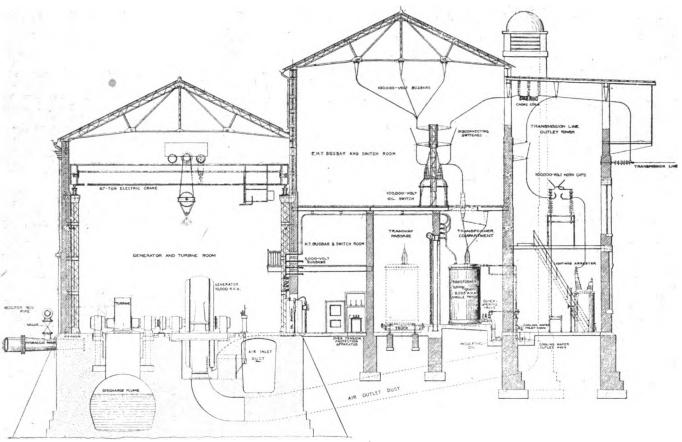

FIG. 24.—BOMBAY HYDRO-ELECTRIC SCHEME: SECTIONAL ELEVATION OF POWER HOUSE, KHOPOLI.

if the author in his reply gave an assurance that these particular examples of commercial dishonesty did not come out of British workshops. The author stated that a temperature rise of only 35° C. was allowed, making the absolute temperature, with an air temperature of 35° C., only 70°. This was considerably lower than the Engineering Standards Committee allowed, even for untreated cotton insulation. The air-gap in asynchronous motors by the author's formula was smaller than generally allowed. He suggested that it would be safer to allow a larger air-gap and counteract its worsening effect on the power factor by using phase advancers. This would also have the incidental advantage of reducing the great-variation in voltage mentioned in the paper.

#### THE BOMBAY HYDRO-ELECTRIC SCHEME.

BY ALFRED DICKINSON, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, April 29th, 1915).

## (Concluded from page 661.)

The present installation covers two transmission circuits on

one line of towers. The conductors consist of 7-strand hard-drawn copper wire, the area of each wire being 0.095 sq. in.

For the creek-crossing spans a 7-strand hard-drawn silicium bronze conductor is used, having an area of 0.169 sq. in. The mechanical tests are a breaking stress of 14,000 lb., an elongation of 12 per cent. in 6 in. and an elastic limit of 10,500

with metal hoods of malleable cast iron and suspension links of galvanized mild steel, the threaded parts being sherardized and a special non-hygroscopic cement being used for cementing up the parts. The arrangement for attaching the suspension insulators consists of a sleeve in which the conductor is clamped, and for the anchor insulators a gripping sleeve through which the wire is passed and fastened with a split nut, all the parts being galvanized.

Each unit with fittings in place is subjected to a mechanical test of 1½ tons tensile stress for the suspension type, and 1½ tons for the strain type, the stress being applied for 10 seconds in a tension testing machine. The completed units are subjected to an electrical dry test of 60 kilovolts for 5 minutes and 70 kilovolts for one minute, the pressure being obtained from a transformer giving a 50-period sine-wave single-phase supply, and the insulators have to withstand such tests without flashing over or showing any defects.

The towers are of Siemens-Martin steel and are built in two sections, a superstructure and a base riveted to the former

The towers are of Siemens-Martin steel and are built in two sections, a superstructure and a base riveted to the former on site. Three types are used, viz., suspension, anchor, and special towers at creek crossings, about 500 in all being required. The design of all towers is based on a wind pressure of 25 lb. per square foot, the sag of the wires being regulated to give a factor of safety of 4 at this pressure and at a temperature of 50° F. The suspension towers are designed to withstand any two conductors breaking, and the anchor towers to withstand all the conductors breaking on one side. In addition to the stress due to wind, the anchor towers are designed for a change in direction of 30° from the straight, up to an angle of 150° between the circuits, in the vertical or horizontal direction. zontal direction.

Fig. 26 illustrates the three types of towers used. The ordinary towers are 62 ft. high from the ground, and are spaced

500 ft. apart. The creek-crossing towers are 160 ft. high from the top of the caissons, in order to comply with the Government requirement that no part of the transmission line shall be within 80 ft. of the water at high tide, and are spaced 1,185 ft. apart. Each creek-crossing tower is carried on four caissons, consisting of cast-iron cylinders, 6 ft. in diameter, filled with concrete.

One tower of each type was tested to destruction at the maker's works. Such tower was erected complete on the foundations, and was loaded gradually under the conditions for which it was designed. The external loading was applied by steel hawsers to represent the stress-diagram conditions. Under these tests the towers showed the required factor of safety of 4.

The telephone equipment consists of two circuits of No. 14.

S.W.G. copper-clad wire having a conductivity of 45 per cent., a resistance of 17.38 ohms per mile, a breaking stress of 44

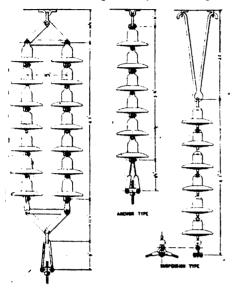

Fig. 25.—Transmission-line Insulators.

tons per square inch, and a weight of 103 lb. per mile. On the land portion of the line the telephone circuits are arranged below the power circuits, one on each side of the towers, and are carried on transposition pin-type insulators, intermediate telephone poles being placed midway between the towers; whilst where the transmission line crosses the creeks the telephone circuits are placed above the power circuits. The instruments consist of water-tight, high-tension, terminal telephones, which are installed at the power house, switch towers, and receiving station, and are mounted on marble panels with protective devices. A transformer is interposed between the speaking and ringing apparatus and the line, and hearing takes place through a rubber tube, which provides for safety in the event of the telephone lines becoming crossed with the power circuits. power circuits.

power circuits.

For removing static disturbances in the telephone line in the event of a fault on a power circuit, a special type of drainage coil is used. Portable telephone sets are also provided.

A guard wire for protection against lightning is arranged over each power circuit, and consists of a 7-strand steel cable, 0.295 in. in diameter, 0.188 lb. per foot maximum weight, and 6,400 lb. minimum breaking strength for the land portion of the line, and 0.378 in. in diameter, 0.309 lb. per foot maximum weight, and 11,000 lb. minimum breaking strength for the creek crossings. These cables are double galvanized and are boiled in linseed cil.

The equipment at the change-over stations in the line consists of four triple-pole, single-throw, 100,000-volt, bolt-type, out-of-door, disconnecting, air-break switches, which are mounted on 7-unit insulators fixed on wooden supports on the towers and are operated by rods from the ground through bevel gears and rack.

Each of the present circuits will transmit a load of 15,000 kw. at 0.8 power factor with a regulation of 11 per cent. and a line efficiency of 93 per cent., and a load of 20,000 kw. with a regulation of 14 per cent. and a line efficiency of 91.5 per cent.

91.5 per cent.

The receiving station is situated at Parel on the Island of Bombay. It has been designed for an ultimate plant capacity of 74.880 k.v.a. in eight 3-phase step-down transformer banks of 9,360 k.v.a. each, and four incoming lines with the necessary switchgear and station auxiliary apparatus, of which five complete units and two incoming lines are now being installed.

The building is capable of extension as required, and the arrangement of the inlet tower, transformer compartments, and high-tension switchgear is the same as for the power house. Each step-down transformer bank consists of three General Electric oil-immersed, water-cooled, single-phase transformers, delta-delta connected. These lower the pressure from 85,800 to 6,600 volts, 50 periods; the guarantees are practically the same as for the step-up transformers, the latter being of the same design, dimensions, and weights.

For the water-supply service to the transformers a system of cooling towers with water pumps, hot and cold well, and

piping is installed. These are duplicate towers, each capable of cooling 18,000 gallons of water per hour from an inlet temperature of 107° F. to an outlet temperature of 87° F. with a wet-bulb temperature of 80° F. They are built of teak frames and posts, with bars and laths of jungle wood, and are treated with preserve the company.

perature of 107° F. to an outlet temperature of 87° F. with a wet-bulb temperature of 80° F. They are built of teak frames and posts, with bars and laths of jungle wood, and are treated with preservative compound.

There are three pump sets, each consisting of a self-regulating low-lift centrifugal pump, direct-coupled to an 8-H.P. 220-volt 50-period 1,450-R.P.M. 3-phase induction motor, and having a capacity of 20,000 gallons per hour against a total head of 45 ft. One pump circulates the water to the transformers from the cold well, which is situated beneath the tower, and another pump lifts the water from the hot well to the top of the tower, the third set being a spare.

The full-load requirements with five banks of transformers in circuit are 18,000 gallons per hour.

For improving the power factor and regulation of the system, duplicate synchronous-condenser sets are provided, each consisting of a 6,600-volt, 50-cycle, 500 R.P.M., 3-phase synchronous motor with a 125-volt exciter on the overhung part of the shaft.

The motors are rated at 3,000 k.v.A. full-load input with a temperature rise of 60° F. for the armature, and 80° F. for the field, the atmospheric temperature being taken at 110° F. and the motors are capable of running at 20 per cent. overload for 10 hours without injury. The exciters are interpole, shuntwound machines, rated at 25 kW. each.

The motors are started up direct from the 6,600-volt busbars through compensators, the starting current not exceeding full-load current; and the total running losses, including the power taken by the exciters, do not exceed 153 kW. at full load and 167 kW. at 20 per cent. overload.

The switchgear equipment consists of the sation power and lighting circuits.

The equipment on the high-tension side is similar to the power-house equipment, except that the oil switches between the bus-bars and the transformer banks are automatically protected by the same relays as the low-tension oil switches to the power-house equipment, except that the oil switches in cell

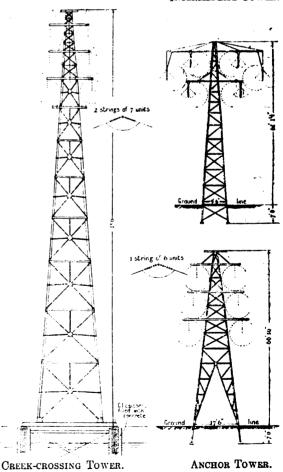

FIG. 26.—Transmission Line Towers.

the former case the oil switches are provided with inverse time-limit, overload, secondary relays for automatic protection, and in the latter case with instantaneous, overload, secondary

The low-tension 6,600-volt bus-bar system consists of copper bar, carried on insulators, in concrete compartments, sectionalised by means of disconnecting switches, whilst an auxiliary bus-bar is provided for the synchronous condensers and the station transformer. The plant is connected up on the low-tension side by varnished cambric-insulated, fireprooftreated cable.

Each phase of the motor-operated oil switches is contained in separate oil vessels, which can be readily removed from

The station transformer bank is connected to the 6,600-volt bus-bar through a triple-pole, motor-operated oil switch with series, instantaneous, overload relays and disconnecting switches.

series, instantaneous, overload relays and disconnecting switches.

The control system is operated at 220 volts from a 60-ampere 8-hour battery, or from the 18 km. charging set which also operates the series motors of the motor-operated oil switches.

Dividing boxes on the wall of the 6,600-volt bus-bar room connect the varnished cambric, single-conductor feeder cables to the armoured three-core cables which are run out of the building in an alley way to a cable chamber, where they are connected to the feeder distribution-system.

The feeder distribution-system from the receiving station to the mills is designed for a 6,600-volt 50-period 3-phase supply with an unearthed neutral. The cables are of the 3-core paper-insulated, lead-covered type, in standard sizes (viz., 0.1, 0.15, and 0.2 sq. in. section) and are laid on the solid system in bitumen in earthenware troughing in trenches 18 in. deep below the footway and 24 to 30 in. below the surface in side and main streets. They are designed for continuous operation at a current density of 1,050 amperes per square inch for the 0.2 sq. in. size, 1,240 amperes per square inch for the 0.1 sq. in. size, and 1,560 amperes per square inch for the 0.1 sq. in. size, with a reduction of 5 per cent. in the carrying capacity when two, and 15 per cent. when four cables are laid side by side. The mills are arranged in groups, each group having a feeder to each mill, with an emergency ring-feeder connecting up all the mills of the group.

The problem presented by the Bombay Mills was the conversion of mechanical to electrical drive utilising the present shafting, the change being effected with as little interference

version of mechanical to electrical drive utilising the present shafting, the change being effected with as little interference as possible with the production of the mills. The problem was thoroughly investigated, and after due consideration group driving with direct-coupled motors was adopted as being best

driving with direct-coupled motors was adopted as being best suited to the requirements.

Standard speeds of 265, 290, and 365 R.P.M. were adopted.

The motors are of the slip-ring induction type, wound for 2.000 volts 3-phase 50-periods and provided with brush-lifting and short-circuiting gear, and are in standard sizes ranging from 30 to 500 H.P. They are designed for full-load rating with a temperature rise of 70° F. above air at 100° F., and for 50 per cent. overload for half-an-hour without undue heating. The full-load efficiencies range from 87 to 92.5 per cent., and the full-load power factors from 0.74 to 0.84.

The starting switches are of the liquid type, the electrodes being operated through slow-motion gear and the motors being designed to start up against the full-load torque with a starting current not exceeding the full-load current. In the case of callender machines special starters are required in order

of callender machines special starters are required in order to meet the conditions of the service.

The mill transformers are of the 3-phase 6,600/2,200-volt 50-period oil-insulated, air-cooled, core type, are star-connected on both sides, and are provided with an earthing device. They are supplied in four sizes, viz., 500, 600, 700, and 900 k.v.a., from which the power requirements of each mill are met. They are designed for full-load rating at 0.8 power factor with a temperature rise of 70° F. above air at 100° F., and for 50 per cent. overload for half-an-hour without injury, and they have at full load a power factor of 0.8, an efficiency of 98 per cent., and a regulation at 0.8 power factor of 2.5 per cent.

The mill-lighting transformers are 6,600/240-120-volt 50-period single-phase, of the same type as the power transformers, and are in 10, 20, 30, 40, and 50-k.v.a. sizes, being designed for the same temperature rating. They have full-load efficiencies ranging from 96 to 97.65 per cent. and a regulation ranging from 1.95 to 1.2 per cent.

factor.

A sub-station is provided at each mill for the transformers and switchgear, the feeders being connected up to the high-tension bus-bars through trifurcating boxes, single-conductor cables, a triple-pole oil emergency switch, and disconnecting links. The high-tension sides of the transformer circuits are connected to the bus-bars through similar disconnecting links, inks. The high-tension sides of the transformer circuits are connected to the bus-bars through similar disconnecting links, and the low-tension sides to the low-tension bus-bars through disconnecting links. The motor circuits are run from the low-tension bus-bars as 3-core paper-insulated, lead-covered and armoured cables to the switch pillars, and single-conductor cables of a similar type are run from the pillars to the motors. The pillars are of the ironclad type with an interlocking design, and are fitted with a triple-pole, automatic oil-switch provided with an overload and no-voltage release, an ammeter, and an isolating plug box. The operating lever has to be in the "off" position before the switch can be opened for overhaul, thus preventing accidental contact.

The whole of the electrical equipment was subjected to insulation tests at the maker's works at a pressure three times in excess of the working pressure.

The present electrification contract covers 30 mills, requiring 37 transformers aggregating 39,500 k.v.a. and 199 motors aggregating 37,525 h.p., the power requirements of individual mills ranging from three motors aggregating 325 b.h.p. to 19 motors totalling 2,400 b.h.p.

All the mill engines were indicated for maximum and average indicated horse-power and tachograph tests were made of

All the mill engines were indicated for maximum and average indicated horse-power and tachograph tests were made of the loads on the shafts, the steam-driven rope drivers being replaced by direct-coupled motors which are installed in most instances in the rope races, on stagings built up of rolled-steel joists, the motor feet being fastened to the steelwork by means of foundation bolts.

In certain cases the motors are placed on steel-tower structures outside the buildings and are roofed in.

The terms of the agreement between the company and the mill-owners cover the supply of energy for power purposes in Bombay at 0.55 anna per unit in the case of mills where the company supply the complete equipment, and at 0.5 anna per unit in the case of mills which provide their own motor equipment, the company providing and maintaining the mill transformers. Energy for lighting is supplied at 1.25 annas per unit. The agreement is for a period of ten years.

The principal contractors for the work here described are as follows:—

as follows:

as follows:—
Hydraulic works, Pauling & Co., Ltd.
Pipe line and headgear, Escher, Wyss & Co.
Power-house and receiving-station transformers and switchgear, General Electric Co., New York.
Turbines and generators, Siemens Bros. Dynamo Works, Ltd.
Transmission towers and insulators, Bullers, Ltd.
Mill equipments, British Westinghouse Electric and Manufacturing Co., Ltd.
Street distribution system, Callender's Cable & Construction Co., Ltd.
The following are the principal members of the engineering staff:—

Engineer in charge of hydraulic section, R. B. Joyner, C.I.E. Resident engineer on hydraulic works, B. D. Richards. Resident electrical engineer and general representative in India, H. P. Gibbs.

Chief of electrical staff, E. S. W. Moore. Consulting engineer, Alfred Dickinson.

#### DISCUSSION AT MANCHESTER.

Discussion at Manchester.

Mr. J. S. Peck said the paper dealt with one of the largest undertakings in the world, and in view of the enormous expenditure involved in preparing dams and making the surrounding country sufficiently tight to hold the water, none but the most daring financiers and engineers would have made the attempt. The transmission voltage, i.e., 100,000 volts, appeared very high for such a comparatively short length of line. Regarding the regulation of the generators, 22 per cent. at 0.8 power factor seemed rather low seeing that automatic regulators were used; 30 per cent, would appear more satisfactory. The cooling water was taken from the main pipe line, and it would seem more economical in view of the power value of such water to install a small pump to circulate the cooling water at lower pressure. The transformers were connected delta to delta, whereas the usual practice was delta to star; the latter arrangement gave a safer construction and permitted the neutral point to be earthed if desired.

Mr. S. L. Pearce referred to the very striking fact that the whole of the water was collected during the monsoon period; whilst the monsoon season occurred with appalling regularity, the amount of water could not be ensured, and it might appear possible for an exceptionally dry season to produce a shortage. Much value would have been attached to figures giving the cost of the hydraulic works and generator end. A Canadian engineer had remarked that whilst people thought power would cost next to nothing if derived through the agency of a hydro-electric company, the Britishers with large steam turbines were far ahead. The remark supported the view that large hydro-electric schemes could not compete with the large steam turbines in this country as regards turning out power cheaply. The transfer bus-bar, whilst usual at the present day, could be dispensed with by treating the steam turbines in this country as regards turning out power cheaply. The transfer bus-bar, whilst usual at the ensemble of the p

mill owner came along and asked what reduction would be allowed if he supplied his own motor equipment, the company fixed .05 anna. Motor equipment salesmen were soon on the spot to convince native proprietors that a saving could be effected by putting in their own motors and buying energy

allowed if he supplied his own motor equipment, the company fixed .05 anna. Motor equipment salesmen were soon on the spot to convince native proprietors that a saving could be effected by putting in their own motors and buying energy at .5 anns.

Dr. Bowans said that a case had occurred in Yorkshire where a dam which covered about an acre and was absolutely free from leakage showed a difference of level of 4 in. during one week-end due entirely to evaporation.

Mr. Fennell said that in an installation of this kind the greater part of the charge for energy would represent standing charge, and it was of interest to know whether the promoters had considered the question of charging on the Hopkinson basis, having a fixed amount per H.P. to cover standing charges plus a small covering charge to cover running expenses. Periods of bad trade were sure to arise when the financial position of the scheme might be jeopardised.

Mr. Moors, in reply to Mr. Peck, said that the 22 per cent. regulation at 0.8 power factor had been adopted as a middle course in the calculations, and so far there had been no reason to regret the decision. Concerning the present state of the scheme, one of the pipe lines was through and working one or two turbines; operation commenced during the past month, so that it was too soon to give operating experiences, although it might be said that in starting up the life to the propose. A stand-by was considered desirable, and for that reason the Tirrill was placed on one side of transformers in circuit. Ultimately it was decided to regulate up to the high-tension bus-bars automatically, using a Tirrill regulator for the purpose. A stand-by was considered desirable, and for that reason the Tirrill was placed on one side of the system and a Brown-Boveri regulator on the other side; the two were not operated together. The ventilation of the large fly-wheel generators presented a problem which was ultimately solved by putting in a large air duct from end to end of the building, with inlet and outlet tower

# COAL SUPPLY CONFERENCE.

On Thursday afternoon, last week, a crowded meeting of representatives of the gas and electrical supply industries was held at the Institution of Electrical Engineers, in response to an invitation issued by Sir John Snell, to attend a national conference to discuss the shortage of coal supply and "for the purpose of considering the best course to adopt for bringing the far-reaching issues involved under the attention of the Covernoont, with a view to some immediate measures of

the far-reaching issues involved under the attention of the Government, with a view to some immediate measures of relief being obtained."

Sir Corbet Woodall, who occupied the chair, drew attention to the extreme importance of adequate coal supplies to both the gas and electrical supply industries; he emphasised the obligations of suppliers of these commodities which justified their demands, and answered those who hinted that they were wanting in patriotism in bringing them forward.

In Germany the use of coal for gas making was being encouraged in view of the valuable by-products obtained.

The present position was brought about in the early days of the war by the commandeering of a large proportion of the shipping, which resulted in freight charges being increased for the remainder, and railway congestion added to the trouble. Now, owing to enlistment of colliers, the supply of coal was

apparently less than the demand, and the highest possible prices were being asked for the output.

He thought it should be possible to prevent the exportation of coal so long as it was needed at home.

Sir John Snell (President, I.E.E.) expressed the willingness of the Council of the Institution to help matters forward, provided Government action was not hindered in any way; he took it that they wanted to improve the output of coal and transport familities.

took it that they wanted to improve the output of coal and transport facilities.

Ald. KAY (Manchester) said one could not control a large undertaking such as theirs without experiencing great alarm at the situation. The Manchester gas undertaking was in a worse position to-day than during the coal strike, and in his opinion there was no need for it. He moved a resolution in view of the vital necessity of gas and electricity for lighting, cooking, and for manufacturing purposes generally:

(1) "That this meeting congratulates the Government on having appointed a committee to deal with the exportation of coal, and hopes that this may be effective in limiting exports, but views with the deepest concern the depleted stocks of coal and the difficulty, under present conditions, of renewing them for present and future requirements, and urges the Government to take further and immediate steps (a) to increase Ing them for present and future requirements, and urges the Government to take further and immediate steps (a) to increase the output of coal from the pits, (b) to give greater facilities for the transport of coal by rail, and (c) to have regard, in requisitioning steam colliers, to the requirements of public utility undertakings which depend for their supplies on seaborne coal.'

Unless there was some improvement, they could not hope to meet the normal winter demand, and he was afraid the Government did not recognise the position. Time was of the greatest moment, and even more important than money.

Mr. Frank Bailey (London), in seconding the resolution, said a Parliamentary Committee had inquired into the question of the property and the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of the provision of t

said a Parliamentary Committee had inquired into the question of house coal supply and found the position serious, but he denied the necessity for every man to hoard up his little stock of coal when there were public utilities ready to supply his light, heat, and power requirements more efficiently. He urged that the requirements of gas and electric concerns should come first. He paid a tribute to the work being done by the gas undertakings, who used the greater quantity of coal but had a valuable by-product in coke. He considered that those who sold coal in London had not taken undue advantage of the situation; in some cases he thought they had lost money. had lost money.

ndvantage of the situation; in some cases he thought they had lost money.

Mr. John Bond (President, Inst. G.E.), in supporting the resolution, said his council had approached the Government on the question, and now the Board of Trade was taking action to prevent exportation.

Mr. R. A. Chattock (representing the I.M.E.A.) said their position was that some hundreds of electricity undertakings were supplying works engaged on Government contracts. Last year they burnt some two million tons of coal, but the stocks were now reduced to 25 per cent. of their amount before the war. He was glad to see that the Government was helping some undertakings, but the price was some 50 per cent. higher than before the war. Lighting supply represented only a tithe of their output, and the power was almost all used in Government work. He urged that they must have adequate coal supplies at a reasonable price.

Mr. Reginald Neville, M.P., suggested that the desired result might be obtained by impressing on the consuming public the necessity of curtailing the use of gas and electricity.

Prof. Sir Alex. Kennedy expressed sympathy with the resolution, agreeing that the London coal men were not making extra profit at the present time; other speakers suggested that this was really a consumers' question, and would be settled if the Government found the voters in opposition; that the definite idea in the resolution was the restriction of export of coal and a strong point should be made of the

be settled if the Government found the voters in opposition; that the definite idea in the resolution was the restriction of export of coal, and a strong point should be made of the dependence of the work of the country on electricity and gas; that the root of the question was the output of the coal workers, which could be increased if the Government, which had power to do it, suspended Clause 4 of the Coal Mine Regulations Act, 1908, which prescribed the working hours; also that in some districts the output of coal had actually increased as compared with last year.

In the end the resolution was adopted practically unanimously.

mously.

Ald. Phillies (Salford), while agreeing with the first resolution, thought it did not go far enough, as it left out the important question of price. He therefore moved:—

(2) "That the Government be asked to take such steps as may be necessary to reduce the price of coals to reasonable limits."

limits. The Board of Trade Committee had admitted that prices had risen out of all proportion to the situation, and had hinted at the possible necessity of the Government taking over the supply of coal.

This resolution was seconded by Ald. Hall (Workington), who considered that there was strong reason to ask for Government taking the considered that there was strong reason to ask for Government.

This resolution was seconded by Ald. Hall (Workington), who considered that there was strong reason to ask for Government inquiry into the methods of selling coal in view of the part taken by coal associations in fixing prices.

Mr. John Christie (Brighton) urged that the Chancellor of the Exchequer should surcharge ship-owners so as to limit their profits to 15 per cent.; in their case coal freights by sea were costing £15,000 a year for services worth about £5,000. The resolution was also discussed by other speakers, one of whom pointed out that the resolution left the price quite in doubt, and to remedy that proposed an amendment, which

was lost, the original resolution being carried by a large

majority.

The CHAIRMAN then moved the third resolution, which was seconded by Sir John Snell, and was as follows:—

(3) "That a representative deputation of the gas and electricity industries be now appointed to present our case to the members of Parliament and to take such further action as may be found advisable.

That a conference with members of Parliament he held in

That a conference with members of Parliament be held in London to seek their aid in urging upon the Government immediate action to give effect to the above recommendations.

That a conference with members of Parliament be held in London to seek their aid in urging upon the Government immediate action to give effect to the above recommendations. That each authority represented pledges itself to take steps to secure the presence of their member or members of Parliament at the proposed conference."

The composition of the deputation, which was approved by the meeting, is as follows:—Sir Ryland Adkins, M.P., director, Herne Bay Gas & Electricity Co.; Mr. Edward Allen, engineer, Liverpool Gas Co.; Mr. F. Bailey, joint managing director, City of London E.L. Co.; Mr. J. Ferguson Bell, manager, Derby Gas L. & Coke Co.; Sir Joseph Bellamy, chairman, Plymouth and Stonehouse Gas L. & Coke Co.; Mr. John Bond, president, Inst. Gas Engineers; Mr. W. G. Bradshaw, chairman, Commercial Gas Co.; Lond.; Dr. Charles Carpenter, chairman, South Met. Gas Co.; Mr. W. A. Chamen, engineer, South Wales E.P.D. Co.; Mr. R. A. Chattock, acting president, I.M.E.A.; Mr. F. E. Cooper, sec., Gas. Co.'s Protection Assoc.; Mr. A. C. Cramb, president-elect, I.M.E.A.; Mr. W. T. Dunn, sec., Inst. Gas Engineers; Mr. Hardman A. Earle, Yorks, Elec. Power Co.; Sir J. Fortescue Flannery, Bart. M.P., director, South Suburban Gas Co.; Sir D. Ford Goddard, M.P., chairman, Ipswich Gas L. Co.; Mr. J. S. Highfield, engineer, Met. Elec. Supply Co.; Captain R. S. Hilton, manager, Birmingham Corp. Gas Dept.; Bailie Irwin, chairman, Glasgow Corp. Gas Comm.; Mr. J. R. H. Jacobs, sec., Southampton Gas L. & Coke Co.; Mr. H. E. Jones, chairman, Wandsworth, Wimbledon and Epsom Dist. Gas Co.; Ald. Kay, chairman, Manchester Corp. Gas Comm.; Sir Alexander Kennedy, F.R.S., cons. engineer, Westminster Elec. Supply Corp., Ltd.; Mr. A. Masterton, engineer, Edinburgh and Leith Corp. Gas Dept.; Mr. C. H. Merz. Newcastle-upon-Tyne El. Supply Co.; Mr. Reginald Neville, M.P., chairman, Salford Corp. Gas Dept.; Mr. W. E. Price, engineer, Hampton Court Gas Co.; Mr. P. F. Rowell, sec., Inst. Elec. Engineers; Mr. A. H. Seabrook, manager, St. Marylebone El

to the Chairman.

#### SOME PECULIAR VIEWS ON ELECTRIC · LIGHT SWITCHING.

BY W. PERREN MAYCOCK, M.I.E.E.

Switching" is here meant the control of glow-lamp circuits by means of small local switches—mostly of the tumbler variety. Ir may be mentioned to start with that by "Electric Light

It is, perhaps, hardly necessary at this time of day to point out that quite a number of other electrical types of tumbler switch besides the single-way are available, and that their intelligent utilisation forms almost as important a branch of electric-light fitting as attention to the requirements of satis-

factory illumination.

Without entering into details, it may be stated that there is as much difference between an installation fitted with due

is as much difference between an installation fitted with due regard to modern switching conveniences, and one fitted in the ordinary manner, as there would be between the latter and an installation with all the switches in the lampholders. It may interest some readers of this journal to know that your contemporary Electricity is publishing this month one of the periodical sets of examination papers in electric-light switching due to Messrs. A. P. Lundberg & Sons; and those who are not acquainted with these examinations might do worse than investigate this subject. That it calls for investigation by many who are concerned with electric light fitting is very obvious to those who know what peculiar ideas of it some people have.

It is proposed to confine this article to a few instances which were quoted in reply to the following question in the last examination:

examination:—

"Cite any instances that have come to your notice of the deplorable ignorance of the connections and conveniences of modern controls that exists in some quarters. As an example, there was a consulting engineer who objected to the use of 'Twinob' switches because of the danger of short-circuiting."

The writer (who was the examiner) has taken care to put the various cases without any exaggeration, though a little disguise has been necessary. The few examples that are given are obviously but a drop in the ocean to those that must

given are obviously but a drop in the ocean to those that must

occur daily.

(a) A two-way-intermediate circuit had been fitted up in tunnel, where it proved of undoubted advantage. The chief afterwards remarked to the fitter—referring to the intermediate switch—"I suppose that's one of those 'Twinobs' down there." The point here is the confusion of the Intermediate with the "Twinob" switch, whose functions are quite different.

quite different.

(b) An intermediate switch was suggested as a necessary addition to a two-way control in a railway station, at a point quite close to the existing strapping wires. The foreman was averse to the idea, as he thought it involved bringing the "feed" up to the switch. As a matter of fact, all that was necessary was to cut the strapping-wires, lengthen them slightly, and connect them into the intermediate switch.

(c) A two-way control was ordered for the yard of a works, and an intermediate switch was suggested for a mid-way point past which the two-way strapping wires had to run. The proposal was not appreciated because it meant "two or three extra wires to the switch." In reality no more wire was required.

required.

(d) The second engineer to a very large provincial electric

cequired.

(d) The second engineer to a very large provincial electric supply department considered two-way control a great novelty, and asked some of his wiremen if they had ever heard of it, and whether they could do it. Actually, the two-way control is something like a quarter of a century old!

(c) An electrician-in-charge started on the wiring of a new circuit, which included a two-way control. When the time came to wire-up to the switches, our friend was taken suddenly ill, and his illness was so protracted that a contractor was deputed to finish the work. As soon as this arrangement was entered into, the electrician recovered and resumed his duties in company with the contractor's wireman!

The conclusion that may be drawn is clear.

(f) For a certain very important purpose a two-way intermediate control was required on a ship. This requirement proved to be beyond the powers of several "specialists." After some months' waste of time on this intricate problem the writer (examinee) ventured to fit up the control himself, to the surprise and confusion of the "specialists," who had seen nothing like it. The switches have since been on continuous and satisfactory duty night and day for many months.

(g) There was a professional man who, although also an amateur electrician, proposed to revert to gas because his electricity bill was higher. Happily, a friend stepped in, introduced a few modern controls which effected economy in consumption, and so saved the situation.

(h) A series-parallel-and-off switch fitted on a steamer proved a puzzle to an electrical engineer, who had to be shown by a friend that there was a central or "off" position.

(i) A firm of London contractors of some repute once tried to obtain two-way-intermediate control with three two-way switches!

(j) An institute is being built in Scotland, and is to be

switches!

(j) An institute is being built in Scotland, and is to be lighted by electricity. The lighting committee consists of some half-dozen people whose knowledge of the subject is of the vaguest kind. Advice on modern controls was tendered by the one qualified electrician in the district, but was rejected, and the single-way switch is to hold undisputed sway.

It will be observed that most of the above examples relate to two-way or two-way-intermediate circuits. It may, therefore, be assumed that the somewhat more special controls—restrictive, master, or pilot—for instance, still remain to be discovered by many people of technical repute.

Locating Projectiles by A.C. Electromagnet.—According to a note to the Académie des Sciences by M. J. Bergonié, alternating current electre magnets have been used successfully in Temporary Hospital No. 4 (Grand-Lebrun) at Bordeaux, to locate shell splinters, German bullets or other magnetic prejectiles in wounded soldiers. Best results have been obtained when using a core of insulated plates 0.2 mm. thick, 75 cm. long and 7.7 cm. in diameter, wound with 252 turns of wire carrying 23.5 amps. at 240 volts, 50 cycles per second. The alternating magnetic field thus produced sets in vibration any magnetic material embedded in living tiesue, and either by visible vibration of the surface of the flesh or by a trembling drag on the hand holding the magnet, it permits tiesue, and either by visible vibration of the surface of the steel or by a trembling drag on the hand holding the magnet, it permits the detection and approximate localisation of magnetic splinters and bullets. Holding the core just clear of the slesh, it is said to be possible to locate a 5 gm. splinter or bullet at a depth of 10 cm. and, without the aid of radiography, to ascertain quickly where the metal is nearest the surface, and hence the means by which it can best be removed. In the original communication (April 6th, 1915), several examples are given of the application of this new method.

Nickel-Plating Aluminium.—The difficulty of electroplating aluminium with nickel lies not in devising a suitable electrochemical process but in securing a coherent deposit. An intermediate coating has generally been considered indispensable between aluminium and nickel, and copper, zinc and iron have been proposed and tried in various ways. In the first place, however, a chemically clean surface must be secured on the aluminium, and to the well-known difficulty of obtaining this must be attri-buted failure to secure a deposit which will stand mechanical workbuted failure to secure a deposit which will stand mechanical working. A new process described by MM. Canso and Tassilly before the Socié'é d'Encouragement pour l'Industrie Nationale, is claimed to overcome this defect. The aluminium piece to be plated is passed first through a boiling potash bath, then brushed with milk of lime, dipped in a 0'2 per cent. potassium cyanide bath for several minutes, and finally subjected to attack by an iron chloride solution (500 gm. hydrochloric acid, 500 gm. water, 2 gm. iron), till the appearance of the aluminium resembles crystallised timplate. After each stage in this treatment the work is thoroughly waked in water. The following is found to be a satisfactory nickelling After each stage in this treatment the work is thoroughly washed in water. The following is found to be a satisfactory nickelling solution:—Water, 1,000 co.; nickel chloride, 50 gm.; boric acid, 20 gm., worked at 2.5 volts and 1 ampere per sq. dcm. The deposit obtained is matt-grey on leaving the bath, but easily takes a good polish under the scratch brush. Above all, it is claimed that the coating will stand bending and hammering without peeling or cracking. The reason for the adherence of the deposit appears to lie in the strong radiusing action of the neasont between avolved. coating will stand bending and hammering without peeing or cracking. The reason for the adherence of the deposit appears to lie in the strong reducing action of the nascent hydrogen evolved when the aluminium is plunged in the ferric chloride pickle. Metallic iron is deposited on the aluminium, and, though its amount is so small (0.25 to 0.5 gm, px sq. metre), that it cannot form a continous intermediate deposit, the iron forms with the aluminium a number of tiny couples favouring attack by the acid pickle. The surface of the aluminium is thus very minutely but very completely pitted so that, besides being deposited on the nearest practicable approach to a chemically pure surface, the nickel coating is actually locked or "rooted" into every part of the aluminium surface, and it is on this mechanical action that the tenacity of the deposit depends. Aluminium thus protected is the tenacity of the deposit depends. Aluminium thus protected is said to be unaffected by moist air, dilute and boiling sods, scettic soid, sea salt, wines, and foodstuffs, and does not permit leakage of petrol. It is recommended as useful for electrical conductors and is claimed to extend greatly the possible applications of

Wireless Control of Public Clocks.—A letter from Mr. A. E. Ball, in the April number of the Horological Journal, replies to the remarks of Mr. Hope Jones on this subject, mentioned in our issue of April 30th. Mr. Ball points out that to check each clock locally by the Eiffel Tower signals destroys the essence of his scheme—central control—and involves checking the local observers. The cost of the wireless control, he says, is small, and the latter, with a wave length of 50 m., in no way interferes, even with amateurs who use 200 m. Moreover, at the times chosen for checking the clocks, 10 s.m. and 8 p.m., hardly any amateurs would be at work. would be at work.

Reporting back by wire involves a cost for wayleaves, &c., out of all proportion to the advantages gained.

Oil-Electric Barges.—A novel type of barge propelled by electric motors, the power being obtained from dynamos driven by oil engines, is to be put in service by the Mississippi Electric Navigation Co., of St. Louis.

The arrangements adopted are extraordinary. There are two 240-H.P. Diesel engines, driving dynamos in the engine room, where are also located the auxiliary lighting and pumping sets. For the propulsion there are four screws, each driven by an electric motor, which is external to the boat and enclosed in a watertight casing. which is external to the boat and enclosed in a watertight casing. which is external to the boat and enclosed in a watereght caseing. All the motor-propeller units are hinged together, and serve as a rudder. The boats are designed to carry 1,000 tons on a draught of 5 ft. 6 in., and are to be fitted with three loading granes. The total cost of construction is said to be about £14,000.—Motor Ship and Motor Boat.

# GOVERNMENT POLICY ANNOUNCED.

LAST week, when most minds were preoccupied with the serious question of the unnaturalised alien within our borders, Mr. Asquith's announcement respecting the new policy of the Government in this matter received so much attention in the Press that we were in danger of overlooking the importance of a speech from the lips of the Right Hon. J. A. Pease, which followed at a later stage of the same sitting of the House.

Mr. Pease was making the annual statement regarding the work of the Board of Education and its various establishments, and after having paid a fitting tribute to the Universities, London and Provincial, for the large number of their students who have joined the Colours, he entered apon a matter of supreme importance to the industrial future of this country, and announced a policy which proves that the appeals that have been made to the Government to consider some of the possible after-effects of the war upon our manufacturing industries have not fallen upon deaf ears.

The Government, it appears, has decided to proceed immediately with the appointment of an Advisory Council on Industrial Research, and Mr. Pease is in search of a Committee of experts who will consult with other expert Committees working in different directions. These expert Committee-men will, in turn, associate with leaders of industry, and in the whole matter "the Department"—we are not sure whether this means Mr. Pease's own department or the Advisory Council itself-will work in close cooperation with the Board of Trade. Mr. Pease proceeded further to state that he was then considering names, and hoped that the Advisory Council would be at work within

Readers who have closely followed our articles relating to the war since August last will remember that we have on several occasions dealt in some detail with the necessity for such a course being adopted by the Government, in view of the many and peculiar new problems that have presented themselves in connection with certain manufacturing industries consequent upon the state of war. We need not recapitulate our own suggestions now-they will be found in detail in our issue of October 23rd, 1914—but we congratulate the Government upon having found time in these very trying Parliamentary days to take steps which, at any rate, form an excellent beginning.

The apprehensions that many trade and industrial authorities have, that after the war is over Teutonic competition will be fiercer and still less scrupulous in its methods than it has been in recent years, are also the apprehensions of Mr. Pease, and he recognises that strong and appropriate measures must be adopted. The Government have had the matter under consideration, and have agreed that something must be done at once. It is not at all inappropriate that the announcement should emanate from the lips of the representative of the Board of Education, for in all discussion of this subject it has been most obvious that our educational

Digitized by Google

system has much to answer for in respect of our shortcomings, though, of course, there are many other and important factors as well. But after so much discussion concerning the necessities of the situation, it is gratifying that at last the serious nature of some of our industrial problems has been actually brought home to the mind of the Government, and that action is being taken. From the Times report of Mr. Pease's speech we gather that the Government agree that we must make more use of the workers who exist in this country; that we must prepare for an increased supply of them; that we must bring our Universities and technical schools into closer association with industries, and our leaders of industry into closer association with skilled workers. It is for these and other purposes that this Advisory Council on Industrial Research is being set up, and we are sure that the proposal, which met with a cordial reception from subsequent speakers in the House, will also be received with a general chorus of approval from both scientific and industrial authorities. As a beginning, Mr. Pease hopes to place on the Supplementary Estimates a vote of between £25,000 and £30,000 for the objects named, and in adding that the scheme must be dependent upon State help for years to come, he said that this State help must steadily progress. Two further remarks in his speech convey the idea that he has a fairly correct appreciation of the criticisms of educational authorities in recent years. For the future of the country our youth must be kept longer at school when it shows itself able to benefit by further education; and the nation must create careers for men who are capable in the scientific world to benefit therefrom.

From the foregoing it will be clear that this Advisory Council on Industrial Research will not be too closely restricted in regard to the scope of its operations. Its problems are large, its duties are of extreme importance, and the time may be short. We hope that no time will be lost in securing the best men available for the Council, and ensuring that they shall be brought into effective association with the leaders of our own and other industries, and that the promised close co-operation with the Board of Trade may enable us nationally to adopt, without any further delay, that course which shall ensure the more efficient co-operation of science and industry which is so essential if we are to render ourselves better able to hold our own against nations which have eternally disgraced themselves by their barbarities and inhumanities, and have made themselves unfit to trade with until they have rendered for ever harmless all who have been responsible for the horrible carnage of these terrible days.

In one of our early editorials on the war, we suggested the holding of a conference of electrical industrial and commercial authorities, in the hope that some organised form of pressure could by that means be brought to bear upon the Government in respect of the above and cognate We gather from the annual report of the matters. Council of the Institution of Electrical Engineers that a German Trade Committee was appointed and held a number of meetings in conjunction with representatives of the B.E.A.M.A. The following quotation from the report will explain what was the ultimate decision :-

#### GERMAN TRADE.

Sion after the outbreak of the war a Committee was appointed by the Council to keep in touch with the British Electrical and Allied Manufacturers' Association in regard to the question of securing for British manufacturers the trade hitherto done by Germany and Austria-Hungary. A number of meetings of this Committee were held, at which representatives of the Manufacturers' Association were present, and the position was very fully

Eventually, after several suggestions had been considered, the Committee came to the conclusion, with the concurrence of the Manufacturers' representatives, that the continuance and expansion of British trade after the war will mainly depend on economic principles and on the commercial industry and initiative of British manufacturers, and that no useful action on the part of the Institution appeared to be possible.

At first the Committee were in favour of holding a meeting for

the purpose of discussing a paper on certain aspects of the competition of foreign countries, but after consideration the Manufacturers' Association were of the opinion that the result likely to to be obtained would not justify such a meeting being held, and, at their request, the idea was abandoned.

The Committee referred to above still remains in being for the purpose of advising the Council in regard to any question which may arise in the future.

We are glad to read the closing paragraph, for it is comforting to know that the Committee still remains in being. May we be pardoned if we await with certain anxiety the next bulletin? It will be quite excusable, seeing the absorbing interest that most electrical men are taking in the future possibilities of the industry, if the average member of the Institution wishes to inquire which is the correct authority to decide what are and what are not fit subjects for discussion in public meeting.

Inquisitiveness may even lead some to wonder whether in appointing its Council on Industrial Research the mind of the Government was influenced in any degree by any of our representative electrical organisations. If so, we think it should be known; if not -well, the credit belongs to somebody else: either the Government authorities, or some of the scientific societies which, as we mentioned in our last issue, have busied themselves with the subject of science and industry, and recently sent a deputation to the Presidents of the Board of Trade and the Board of Education.

When we commented on the rules for Standardisation the standardisation of electrical machinery Rules. formulated and provisionally adopted by the British Electrical and Allied Manufacturers' Association just two years ago, we remarked that it would be unfortunate if every Association were to issue a set of rules on its own account, but that in view of the pressure of competition it was desirable that a uniform basis of rating electrical machinery should be established without undue delay. At that time the International Electrotechnical Commission was engaged upon this very question, and the Report of the Engineering Standards Committee on Standards for Electrical Machinery was out of date.

In the interval the I.E.C. has given great attention to the matter, and has endeavoured to harmonise the views of the British, American and German Committees, with especial reference to the temperature limits to be prescribed; as regards the German Committee, circumstances have intervened which need not be particularised, but so recently as last month an American deputation was in this country conferring with our representatives on the subject of electrical standards, and we believe substantial agreement was arrived at. The importance of international uniformity in this respect is obvious. No definite rules, however, have yet been issued in this country other than those above referred to, and therefore it is apparent that the Association was well advised in providing a set of standards for use in the interim.

A new edition, or rather a reprint, of these rules has now been issued by the B.E.A.M.A., and in the preface we are informed that owing to the impending publication of the first section of the new British standard rules by the Engineering Standards Committee, it was thought best not to introduce the changes in the Association's rules which would otherwise have been made. This decision is commendable, as it limits the confusion and disturbance due to modifications in the rules to a single set of changes. Seeing that the Standards Committee has had the matter in hand so long, it is interesting to learn that we may look for the fruit of its labours at an early date.

The B.E.A.M.A., however, has appended very considerable additions to the original code, in the form of a supplement, which we reproduce in full in this issue. It will be seen that the new sections cover a wide range, and doubtless represent a great deal of hard work on the part of the Committee charged with the duty of formulating the rules. Some interesting questions are raised by the new clauses; the introduction of "tolerances," for instance, into guarantees, and the method of determining the "average-load guarantee," are novel features. Whether in some cases the range of tolerance permitted will be acceptable to the purchaser, when the latter is himself an engineer and capable of appreciating exactly the value and meaning of the limits specified, is open to question.

It will be borne in mind, of course, that these rules are primarily designed for the use of the manufacturer, and while we do not su

ti

1

while we do not suggest that they are prejudicial to the interests of the purchaser, it is not to be expected that they shall err in his favour.

Some of the rules savour rather of the text-book, such as those relating to cyclic irregularity and to the use of reactances for the protection of alternators; Section X, in fact, can hardly be said to embody anything in the nature of standardisation.

An excellent feature of the code is the provision of distinctive and uniform markings for the terminals of machines and transformers, and of conventional symbols and letters for switchgear and instruments; it is to be hoped that these will meet with general acceptance. Other countries have long had in operation codes of symbols for wiring diagrams, &c., and it is very desirable that uniformity should be attained in this respect, as in the use of symbols in formulæ, which has already been dealt with by the I.E.C.

While representing the views of only one section, though a very important and influential section, of the industry, and to be regarded rather as a temporary system pending the issue of a code of rules by the Engineering Standards Committee that will be acceptable to all parties, the Rules of the B E.A.M.A. are to be welcomed as a praiseworthy and practical effort to amend a very marked deficiency in our industrial organisation. We take it that they are not put forward as rigid and immutable standards, but as a working basis for friendly agreement between the parties to a commercial transaction, and we have no doubt that in this sense they will be favourably received by the industry.

THE tone of the copper market has been hardly so good, but this has arisen apparently not because of any rift in the situation, but as a reflex of the dastardly outrage of the German Admiralty, acting, no doubt, under the direct instructions of the Arch-Han, upon the Lusitania, and of the political conditions arising therefrom. Of course, no man living can say whether the American President is again bluffing hard, or whether he really does resent the murder of American citizens on the high seas, with which policy Germany has familiarised the world during the past six months, but if he is not engaged in a game of poker, we should be approaching the time when Germany will have to introduce some surface gloss of civilisation into her methods, which may in turn create an altered situation. With the civilised world determined to wipe out the Hun and his practices, the consumption of copper must go on regardless of temporary fluctuations, produced by what, after all, are mainly sentimental con-All that the murder of women and children, and the crucifying of wounded really involves, is the further and further wiping out of existence of the perpetrators of nameless outrages, and all this means that copper must be used in ever increasing quantities.

There has been less activity in demands lately, but the restriction of buying on the part of consumers is always inevitable whenever the standard market wears an appearance of reaction. The actual consumption going on increases steadily, and buying will be impelled from time to time, as orders for ammunition and other work are being increased. The position in the United States has improved considerably as regards consumption, largely owing, of course, to the heavy orders which have been booked by American cartridge makers in connection with the requirements of the belligerents, and the brass trade across the Atlantic is now experiencing a degree of activity and prosperity to which it has been a stranger for years. Meanwhile, production continues to progress steadily, and, indeed, every effort seems to be strained to increase output owing to the exceedingly profitable nature of the business. There can be no diminution in consumption for war purposes, and although there may be a lull in new buying when the war ends, this can be only a temporary measure, for the replacement of damage and the ordinary extensions which have been held back during the war period, will then have to be dealt with, and these should account, for a time at least, for every ton of copper which the world can produce.

For the moment there is a very wide disparity between the prices of standard copper and refined material. There has been liquidation of the former, owing to the political situation in the United States, but, on the other hand, producers have shown not the least sign of wavering, and an adjustment will probably be made, by renewed confidence on the part of speculators causing a buying movement in standard copper, which will practically restore the normal relations between the two grades of material.

WHEN the proposal that the State The Telephone should purchase and work the telephone Disservice. system was coming to a head, we pointed out that the result of this proceeding would inevitably be lower efficiency, higher rates, and incompetent management. We endeavoured to disabuse the minds of the well-meaning but uninformed public of the idea that the State could conduct so intricate an undertaking more ably than a private concern, and by way of example we cited the disastrous records of the telegraphs, than which it would be difficult to find a more convincing illustration of State mismanagement. Our warnings, and those of others who shared our views, were disregarded, and the mischief was done; the property of the National Telephone Co. was acquired under compulsion, on terms which verged upon confiscation, and the trouble began.

To deny that the position of the telephone subscriber had changed for the worse would be shutting one's eyes to the obvious facts; the storm of protest, the agonised appeals for rescue from the tyranny and ineptitude of a State service that swept over London in 1912-13 will not soon be forgotten by the telephone department, which itself was sorely tried by the necessity of coping with the difficulties of a gigantic and complex problem with an inadequate staff, under the control of laymen. Those who hoped for an all-round reduction of rates were sadly disillusionised, as we warned them they would be; there is good reason to anticipate an increase rather than a decrease. The efficiency of the service fell so low that leading City men denounced it as a huisance rather than an aid to busi-Moreover, with the change of ownership came the accompanying change from the reasonable and co-operative methods of a commercial undertaking to the autocratic and arbitrary ways of a bureaucracy; the telephone service was no longer a convenience provided in return for a monetary consideration, but a privilege vouchsafed to those who succeeded in obtaining connections, subject to withdrawal on slight provocation and involving the user in unknown liabilities in the shape of payments for calls of unknown origin, the sole record of which was made by the Post Office staff.

Our warnings and criticisms were issued in the interest of the general public, and not on our own behalf; but we are We have just received a notice not to escape unscathed. to the effect that our telephone number, which has become as familiar to our friends as the colour of our cover, is to be changed (in August, or before) from Holborn 938 to City 997, "owing to the acquisition by the State of the late National Telephone Co.'s system," which has necessitated the rearrangement of certain of the exchange boundaries. There are no half-measures about it; arrangements are in progress for the transfer, and if we don't like it we can, of course, do the other thing. We hardly need point out to business men that the possession of a recognised telephone number, in spite of the deficiencies of the service, is something of an asset, like a known business address, and the arbitrary substitution of a new number is in effect an act of confiscation, without hope of redress.

"The Postmaster-General trusts that you will excuse any temporary inconvenience which may arise from this change"—this is the velvet glove, cynically affecting to conceal the iron hand in whose grip we are, in common with other victims of this Department of State. The Postmaster-General is adept in the use of smooth words and sugared phrases, but these afford no consolation for the injury inflicted upon us.

#### SOME NOTES ON SHUNT REGULATING RESISTANCES.

#### BY THOMAS CARTER.

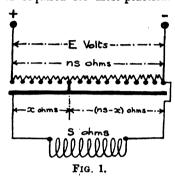

A RECENT article in the ELECTRICAL REVIEW (March 26th, 1915), on "Potentiometer Rheostats and Rheostats with Protective Resistances," suggested to the present writer that some notes on the same subject, dealing with it from a rather more general point of view, might be interesting and useful to those who have to get out resistances of this special character frequently. Three separate sections will be treated, namely :

I.—Potentiometer Regulators.

II.—Regulators with Protective Resistances.

III.—A Special Grading for Ordinary Regulators.

The treatment is, perhaps, more detailed and comprehensive than is required for most practical purposes, but,

just because it is full, it will cover any case likely to arise; and for ordinary purposes the user of the method abstracts as much as deals with average cases, and probably simplifies many of the formulæ for rapid use. As in all other processes employing formulæ, care should be taken not to use them blindly, but only after making sure that they deal with the case considered. The use of a formula without care and intelligence is certain to lead sooner or later to disaster: a formula is a good angel if a servant, but if it becomes master, it is more subtle in temptation than Satanus himself.

1. Potentiometer Regulators.—The standard connections of a potentiometer regulator are shown in fig. 1.

The exciting voltage, E, has across it a resistance, n s, and the field winding, whose resistance is s, is put in parallel with more or less of ns, according as its current is to be increased or diminished.

The amount of resistance in n s is arbitrarily chosen, but it is useful, as will be seen from what follows, to choose some round value for the multiplier n, and to make  $n \cdot s$  thus bear a simple ratio to s, for greater convenience in plotting sets of curves. The present writer was greatly interested to see the set of curves in the earlier article already referred to, as they are absolutely identical in form with those developed by him on more general lines many years ago, and used by him with great convenience ever since. The usual value of n is from 2 to 4, and the circumstances of each case generally show fairly clearly which value is most suitable.

Whatever n be, the following treatment is perfectly general, and expresses all currents in all parts of the circuit in terms of E/s-i.e., of the maximum value of the field current which it is possible to obtain. Let the sliding contact of the regulator be moved to a position which gives x ohms in series with a loop consisting of (n s - x) ohms in parallel with s ohms. Let x be q times  $n ext{ s}$  ( q having any value from zero to unity). Then the total resistance between terminals is-

$$x + \frac{(n s - x) s}{n s - x + s} = q n s + \frac{(n s - q n s) s}{n s - q n s + s},$$
which simplifies to  $s \cdot \frac{(q - q^2) n^2 + n}{(1 - q) n + 1}.$ 
The total current in the circuit is therefore

The total current in the circuit is therefore-

$$\frac{E}{s} \cdot \frac{(1-q)n+1}{(q-q^2)n^2+n},$$

and this is clearly the value of the current in x. The current

in (ns-x) is s/(ns-qns+s) = 1/((1-q)n+1)of the total, and the current in s is (ns - qns)/(nsq n s + s = (1 - q) n/((1 - q) n + 1) of the total, so

$$\frac{E}{s} \cdot \frac{1}{(q-q^2) n^2 + n}$$
 is the current in  $(ns-x)$ ,

 $\frac{E}{s} \cdot \frac{1}{(q-q^2) n^2 + n} \text{ is the current in } (ns-x),$ and  $\frac{E}{s} \cdot \frac{(1-q) n}{(q-q^2) n^2 + n} \text{ is the current in the field}$ 

The curves in fig. 2 are plotted from the above expressions, the ordinates representing currents in terms of E/s, and the abscissæ values of x from zero up to n = i.e., from q = 0 to q = 1.0. The value of n chosen for these particular curves is 3.5.

The following table gives the values (with n indeterminate) of the current in the three parts of the circuit for various values of x.

Current in x = total current. Current in s = field current.  $= \frac{x}{q \, \pi s}. \text{ Current in } (\pi s - x).$ 1.0 ns | E/s. 1/n

If curves be plotted, similar to those in fig. 2, but for other values of n, say 2, 2.5, 3 and 4, this set of curves will cover practically all possible cases that can arise. These curves are clearly of a more generally applicable nature than those shown in the earlier article, as the latter apply to certain definite currents in amperes and definite resistances in ohms, while those here described, being based on fractional values of a perfectly general total, are of perfectly universal applicability. The only constants required for any case are E and s, which are given, and n, which is suitably chosen. The value of the field current required at

each step of the regulation is first determined to suit the specified conditions of speed or voltage variation. These successive values of field current are tabulated as fractions of Es, and from the curves the corresponding values of x, as a fraction of n s, and current in x, as a fraction of E/s. are obtained. By multiplying these two sets of figures by ns and Es respectively, the required resistance in ohms and capacity in amperes of the steps of the regulator are obtained. A numerical example is scarcely necessary, as the simplicity of the method is obvious.

For a case like a booster, it is, of course, permissible to reduce the field current to zero; but in the case of a motor, there will usually be a limiting value below which the current should not be reduced. This means that not all of ns should be variable, but that a certain part should be arranged as a last step, not capable of being cut out, of such a value as will give the required field for the maximum speed specified. If this be not done, there is the danger that the field may be made to disappear altogether, with disastrous results for the motor.

The use of a potentiometer regulator clearly diminishes the efficiency of the machine it is used with. Hence n should be kept as great as possible, so as to reduce the additional loss in the regulator as much as possible. But, on the other hand, if n s be abnormally large, it may lead to a very bulky resistance, as the regulator has always to carry a current greater than the field current. The choice of n is therefore, as in so many cases, a compromise between two opposing ideals, and experience is the best guide in making the selection. The most usual range of values has, however, already been indicated.

(To be continued.)

# THREE-PHASE ELECTRIC CRANES AT THE PORT OF BORDEAUX.

TRAFFIC to the port of Bordeaux has increased very rapidly during recent years, some indication of its growth being given by the fact that 116 goods-handling machines of various types worked nearly 140,000 hours in 1912, as compared with 51 machines working 36,000 hours in 1902; and during the first six months of 1913 the weight of merchandise handled was 2,230,000 tons, or 28 per cent. increase on the corresponding figure for 1912. On the extended Queyries wharves, the No. 2 wet dock, and in the elaborate silo and transporter equipment erected to serve warehouses and the coal yards of the Paris-Orleans Railway, electrical equipment has been adopted very extensively, and has resulted in marked acceleration and cheapening of operation. According to La Revue Electrique, six large electric cranes are now installed on the Queyries wharves, each capable of raising 3,300 lb. at 235 ft. per min.; 6,600 lb. at 160 or 235 ft. per min.; or 11,000 lb. at 160 ft. per The range is 34 to 46 ft., according to the inclination of the jib; the speed of crane rotation, 2 R.P.M.; speed of translation, 40 ft. per min.; total travel of hook, 100 ft.; centre of jib pulley above rails at maximum radius, 60 ft.; gauge of rails, 9 ft. 3 in. In each case a double drum windlass is provided, permitting the use of three-cable grab-buckets (two cables for lifting, one for opening), and so arranged that the lifting drum can be used alone for loads up to 11,000 lb., or the auxiliary drum alone for loads up to 6,600 lb. The grab bucket can be raised or lowered when open or shut; and can be opened or shut at any point in its travel whether full or empty. Of the 14 electric cranes at the No. 2 dock—five have 46-ft. radius and lift up to 6,600 lb. by single cables; five otherwise similar cranes have three-cable grab-bucket gear; and four of 46-ft. radius, lift up to 11,000 lb. in three-cable grabbuckets.

Three of the Queyries cranes use compressed air at 90 lb. per sq. in. to operate brakes and couplings, but three later cranes include, among other improvements, all electric operation of auxiliary parts. The mechanical features of the latest hoisting gear are particularly simple. A heavy foundation plate carries both drum shafts on ball bearings, the latter being used to reduce maintenance, increase efficiency, and permit light loads to descend easily without current. The front shaft carries the main drum; the rear shaft carries the auxiliary drum, driving gear and cone clutch. Between the drum shafts is a countershaft, driven electrically through a band brake coupling which is closed only during hoisting. On this shaft are two loose pinions, provided with claws which may be engaged with corresponding countershaft claws, the latter being operated simultaneously or independently by the driver. As a result, the drums may be driven simultaneously or independently, and any desired combination of movements can be easily secured.

The main drum is driven through a geared rim, the auxiliary drum through a large leather-faced cone. The latter has a "counter-cone" so that, when working with grab buckets, the release-cable is tightened during closing, and no time is wasted when the bucket is to be opened. A motor-brake engages the cone of the auxiliary drum, liberates it (leaving the drum free), or engages with the counter-cone while closing the grab. The winding drums are 700 mm. in diameter, grooved, and each is provided with a long-arc, band-brake drum. The front drum has two 20-mm. cables and the other drum a single 22-mm. cable, which is used to open and close the grab or to lift loads up to 6,600 lb. On the end of the intermediate shaft opposite to the coupling, is an automatic brake preventing running back of the load during hoisting, due to current failure or other cause. All brakes and couplings are actuated by small 100-volt, singlephase, series commutator motors, the energy consumption of which is kept down to a minimum by suitable brush displacement. Compressed air is supplied to the brakes and clutches of the three older Queyries cranes by an electricallydriven compressor.

The mechanical features of the older cranes are less simple, an intermediate change-speed gearing being employed to suit various loads. In the later cranes, three-phase series commutator motors are used (instead of ordinary induction motors) in order to secure automatic speed variation in

inverse proportion to the load.

Three-phase current at 440 volts, 50 cycles, is taken from distribution boxes connected in underground cables, by a cable coiled on an automatic paying-out drum, which takes up all slack and permits 66 ft. travel of the crane on either side of the distributing box. From slip-rings on the cable drum, current is taken through rings on the pivot and brushes on the turning part of the crane to the cabin switchboard.

The jib is elevated through double worm gearing by a 4.5-kw., 1,000-R.P.M., 440-volt motor, and its position at any moment is shown automatically by an indicator in the driver's cabin. Slewing is effected by a 7.5-kw., 1,000-R.P.M. motor driving a worm gear and pinion, meshing with a circular rack on a track 12 ft. in diameter. Another 7.5-kw. motor propels the crane as a whole through worm, parallel and bevel gears. These three motors are asynchronous machines; the slewing motor is open, the others are enclosed and further protected by sheet metal hoods. The winch motor is an open-type 52-kw., 200-R.P.M. machine, with ball-bearings; its commutator gives no trouble in service. The 100-volt, single-phase auxiliary motors are supplied through a transformer in the cabin.

Ordinary rheostatic control being inapplicable to three-phase motors, two systems were tried in the first three Queyries cranes. In each case a single lever controller is arranged so that pushing the lever forward starts and couples the hoisting motor, while completely releasing the brakes; and pulling the lever backwards releases the brakes progressively for lowering loads without current. In two cranes fitted with asynchronous hoisting motors, the control lever actuates an ordinary grid resistance controller, but in the third crane, using a series commutator winch motor, the controller is connected to the tappings of a variable voltage transformer. In both cases the control lever operates the air brake and clutch valves simultaneously with the electrical connections.

In the newer cranes, all driven by three-phase series commutator motors, the control lever operates a quick-acting reversing switch, and also through a toothed sector, the rotating winding of a variable ratio static transformer, which is mechanically balanced in all positions of the control lever. A simple means is thus provided for varying power and speed, according to requirements; resistance losses are reduced to an absolute minimum.

The acceptance test on these cranes demanded that full load be raised  $6\frac{1}{2}$  ft., rotated  $10^{\circ}$  and lowered to earth; then raised to 33 ft., swung through  $170^{\circ}$  and lowered; after which the empty hook was to be raised 33 ft., swung though  $170^{\circ}$ , lowered to  $6\frac{1}{2}$  ft., swung through  $10^{\circ}$  and lowered to earth. The guaranteed mean consumption for this performance was 400 watt-hours, with 11,000 lb. load, and 274 watt-hours, with 6,600 lb. The actual consumption averaged less on 10 tests.

Of the nine three-cable cranes alongside the No. 2 dock four are of 11,000 lb. maximum capacity, and identica with the newer Queyrie cranes. The other five are 6,600 lb cranes, similar to the above but reduced in dimensions in the ratio 7: 6, and fitted with 37-KW., 280 B.P.M., hoisting motors instead of 52-KW., 200-R.P.M. machines. There are motors instead of 52-kw., 200-R.P.M. machines. besides five 6,600-lb. single-cable cranes with 600-mm. drums. An automatic brake prevents running back during hoisting, and is released by hand when lowering loads. main band brake is motor controlled, directly during hoisting, progressively during lowering. The band coupling is also motor-opera ed and acts only during hoisting. All shafts run on ball bearings and the motor is completely uncoupled during lowering so that, with only 130 lb. weight on the hook, a "light" lowering speed of 400 ft. per min. is quickly attained.

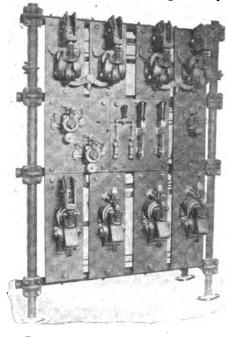

The hoisting motor develops 37 kw. at 280 R.P.M., and is a 440-volt three-phase series commutator machine. Variable voltage control is again adopted in preference to

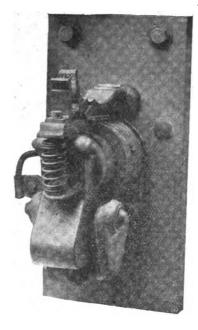

# NEW ELECTRICAL DEVICES. FITTINGS AND PLANT.

#### The Lock-Out Contactor.

THE BRITISH WESTINGHOUSE CO., LTD., of Trafford Park, Man-THE BRITISH WESTINGHOUSE CO., LTD., OI ITAMORU PAIR, MANchester, have recently put on the market acontrol system known as
the "Saries Lock Out Contactor system," which possesses the advantares of the series relay, but eliminates its weak point, i.e., the
relay contact. The feature of this contactor is that it "locks out,"
and will not close, when the current is abore the value at which
it has been set, resistance being out out only when the current has
fallen to a predetarmined value fallen to a predetermined value

Motor current passs through the operating coil winding directly; with the contactor in the open position (shown in full lines, fig. 3) at the instant of applying current, assuming this current to be above the value at which the contactor should close, current to be above the value at which the contactor should close, a flux will pass through the main air gap, through the armature, and along the steel piece A fixed to the armature and carrying the adjusting plug, through the small air gap, and on to the base. The flux tends to hold the contactor open, due to the pull between the plug and the frame being greater than the pull at the main air gap. For a fraction of a second current is prevented from

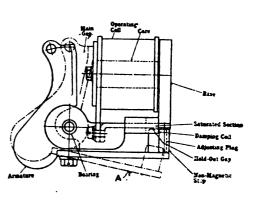

FIG. 1.—COMPLETE CONTROL PANEL.

FIG. 2.-LOCK-OUT CONTACTOP.

Fig. 3.

BRITISH WESTINGHOUSE SERIES LOCK-OUT CONTACTOR SYSTEM.

brush shifting (which offers mechanical difficulties) to secure speed variation from 60 to 200 ft. per min. hoisting full load; and up to 265 fc. per min., hoisting half load. The brake and coupling motors are single-phase, 100-volt series commutator motors regulated by brush displacement. Motors for jib elevation and slewing and crane propul-ion are of the three-phase slip-ring, induction typy.

The two latest 330-ft. berths on the Queyries wharves are equipped with seven electric grab-bucket, travelling transporter bridges, a line of re nforced concrete storage hoppers and two aerial transporter systems, one running to the Paris Orleans Railway coal yards, 11 miles away, and the other serving warehouses and yards along the quay. This equipment has been erected at a cost of about £80 000 specially to expedite the discharge of heavy cargoes, and to reduce handling to a minimum. The wharf transporter bridges permit at least 300 tons per hour of coal to be discharged through four hatches and dumped directly in the silo bins.' The total hopper capacity (in 24 bins) is about 2,200 tons for each berth.

Coal is discharged from the bottom of the silos into railway trucks beneath, or into the buckets of one of the aerial electric transporters, each of which conveys 200 tons an hour at an average speed of 2.75 M.P.H. The total coal tonnage handled for the Paris-Orleans Railway is about 400,000 tons per annum, the charges for wharf, crane, silo and transporter service averaging 4d. to 4.13d. per ton. The new berths with their electrical equipment practically double the effective capacity of the wharves. 500,000 tons per annum can be discharged through each new berth, as compared with 186,000 tons per annum for each of the seven older berths equipped with travelling cranes discharging directly into railway wagons.

passing through the part marked "saturated section," due to the very heavy damping coil which is wound round this.

As the current falls, due to the motor speeding up, the flux through A decreases, but the flux through the saturated section remains the same; in consequence, the pull between the plug and the base decreases, until the pull through the main air gap overcomes it and the context release.

comes it, and the contactor closes.

Without the damping coil the contactor would close as the current was rising, upon it reaching the value at which it was set to operate. But owing to the damping coil the flux is prevented from passing through the saturated section, and consequently it from passing through the saturated section, and consequency all passes through the adjusting plug, and the contactor cannot close. In a fraction of a second after the current reaches the full value, the flux divides between the two circuits, and the contactor is held out by the normal operation of the Lock-Oat device. It is free to close when the current falls to the value for which the contactor has been adjusted.

contactor has been adjusted.

An ordinary non-reversing automatic starter embodying this type of contactor would contain, firstly, a shunt-wound c intactor; secondly, a number of contactors of the type described above, to short-bircuit the resistance in the armature circuit. These contactors are so connected that without the use of any interlocking contacts each contactor is put into circuit, and consequently closes in the order desired. Also the different contactors have their coils short-circuited, and consequently fall out as the next step of resistance to them is short circuited, so that in the "full on" position only the shunt-wound line contactor and the last series wound contactor are in circuit. wound contactor are in circuit.

In order to keep the shunt coil as nearly as possible in line with the series coils as regards reliability, it is wound for a low voltage, and a resistance is connected permanently in series with it.

In comparison with other forms of automatic control gear, the Series Luck-Out system offers the following advantages:—

 The number of shunt coils is reduced to a minimum. These shunt coils are never subjected to the full voltage of the circuit. as in the case, at least momentarily, with most other types of control gear.

2. No dash-pot retarders are used, the acceleration, as explained

above, being fixed by the load on the motors.

3. Small interlock contacts and switches for cutting in an economy resistance are not necessary.

# Terminal for Portable Accumulator.

MR. B. BARBER, engineer to the Oulton Bread Electricity Co., Ltd., finding that many ignition cells and other portable accumulators that were placed in his hands for charging had lost their terminals, or had terminals badly corroded with acid, and being dissatisfied with the makeshift of soldering a terminal on the lug, has devised a neat repair terminal, for which he has obtained provisional protection. Incidentally, he points out that the terminals usually fitted, with a metal stud embedded in the lead lug, are crude and easily twisted off. The component parts of the device are illustrated in fig. 4; they consist of a screw A with a

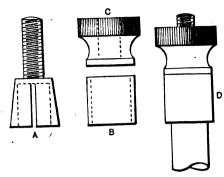

FIG. 4.—TERMINAL FOR PORTABLE ACCUMULATOR.

tapered and slotted base, a ferrule B fitting over the latter, and a milled nut C. The end of the lug is cleaned and filed up to fit the inside of the base, which is bored parallel; the base is then put on the lug, and the ferrule B is slipped over the tapered exterior of the base and forced home with the nut, thus squeezing the slotted base tightly on the lug and gripping the latter firmly. The terminal is shown on the lug at D; it can easily be attached by the user of the battery, and forms a sound and permanent repair. We understand that Mr. Barber wishes to dispose of the right to manufacture the device.

# LEGAL.

CHESTER CORPORATION v. CHESTER WATER WORKS Co.

In the Chancery Division on Tuesday, Mr. Justice Eve heard an application for an injunction by the plaintiff Corporation to restrain defendants from pulling up streets in the city to lay electric cables to the river side.

ME. McMorran, K.C., for the Corporation, said as Mr. Dighton Pollock, for the defendants, would give an undertaking not to proceed with the work for a fortnight, he would consent to a post-ponement of the trial for that time.

BRITISH VACUUM CLEANER Co.'S APPEAL DISMISSED.

JUDGMENT was given in the House of Lords on Monday (Msy 17th) in the appeal by the British Vacuum Cleaner Co., Ltd., against an order of the Court of Appeal in favour of the respondents, Messre. James Robertshaw & Sons, Ltd., in which judgment was reserved on April 26th, as already reported by us, page 613 ante.

The LORD CHANCELLOR, in giving judgment, said the action was brought by the British Vacuum Cleaner Co., as plaintiffs, to restrain infringement of a patent, granted to Hubert Cecil Booth, for improvements relating to the extraction of dust from carpets and other materials. The defence was twofold: first, non-infringement; and, secondly, prior publication and user. The patent had been on several occasions before the Courts in other cases, and this House had decided that it contained a sufficient subject-matter, and was to be construed in a particular sense. It was, however, open to the defendants to prove anticipation as well as non-infringement, and the Court of Appeal, by a majority, reversing the judgment of Mr. Justice Sargant, sitting as Judge in the Chancery Division, decided in favour of the defendants on the question of non-infringement.

The appellants' invention consisted of the combination of an extracting implement and a power-driven suction pump, by means of which a considerable vacuum was obtained and dust laden air drawn into the machine. Prior to the appellants' invention there had been on the market an apparatus for removing dust by suction, but in that apparatus the suction was obtained by bellows as distinguished from a cylinder pump, and its object was to remove dust from the surface only, a process which required but moderate anction.

The conclusion his Lordship came to was that the decision of the majority of the Court of Appeal was right. The appellants had limited their claim to an apparatus capable of maintaining a pressure of at least 5 lb. at the nozzle and the respondents'

machines did not come within the patent so interpreted. Accordingly, he moved that this appeal should be dismissed, with costs.

Lords Strathclyde, Parker and Parmoor read judgments to the same effect, and Lord Sumner expressed his entire concurrence in the result arrived at.

Accordingly, the appeal was dismissed, with costs,

ELECTRICAL APPARATUS Co., LTD., v. CANADIAN BRITISH ENGINEERING CO, LTD.

In the City of London Court on Tuesday, before his Honour Judge Atherley-Jones, K.C., an action was brought by the Electrical Apparatus Co., Ltd., Vauxhall Works, South Lambeth Road, against the Canadian British Engineering Co., Ltd., 4, Queen Victoria Street, to recover £70 182. 6d., which consisted of £43 152. 1d. for electrical goods supplied and £27 3s. 5d. for goods bargained and sold, and damages for refusing to accept delivery under the Sale of Goods Act.

It seemed that the defendants ordered the plaintiffs to dispatch one 10-ampere single-phase meter, 110 volts, to Ontario, and a similar one to the defendant company's office in Winnipeg. Plaintiffs had the goods specially manufactured for the defendants, and then asked for special instructions about delivering them.

MR. TAYLOR, the plaintiffs' secretary, said they telephoned to the defendants that the goods were ready for shipment. They had never been able to receive the necessary instructions, with the result that the goods were on their hands. There was no available market for them as they were made specially for the defendants.

The SECRETARY of the defendant company said they could not pay at present. Ninety per cent, of the company's creditors in Canada and the greater part of the creditors in England had agreed to a scheme whereby they were to have six months' extension of time. If judgment was given for the plaintiffs in that case, the defendant company would have to go into liquidation, and the plaintiffs were the only creditors who were pressing them.

JUDGE ATHERLEY-JONES said he did not want to break up the defendant company, and no doubt the plaintiffs would meet them in a reasonable way.

MR. TAYLOR replied that a meeting had been held of the defendants' creditors in Canada without any reference to the plaintiffs, and there had been no formal meeting in England at which they could attend to discuss the defendants' financial position. They did not consider they were deserving of any consideration, having shown none to the plaintiffs. They did not wish to act vindictively.

JUDGE ATHEBLEY-JONES, K.C., said he did not think they did. He must give judgment for the plaintiffs for £67 3s. 6d. The Canadians had deserved well of this country, and therefore the defendants should receive every consideration.

Electric Furnaces in Italy. — Recently published statistics relating to the number of electric furnaces in Italy up to 1913, show that they are in use by four establishments engaged in iron smelting and ten in other industries. Of the former, the Dalmiene works at Bergamo have doubled their plant, and their output of iron piping is now 30 tons yearly. The plant comprises two Héroult furnaces. The Tranchi-Griffin works at Brescia is considering the introduction of a Stassano electric furnace for the production of cast-steel. The Darfodelle Ferriere works at Volta has continued the production of foundry iron with a 3,000-kw. Héroult furnace; it also produces fine iron, ferromanganese, ferro-silicon, and carbide of calcium with three Keller furnaces of 1,500-kw. capacity, four of 750, and two of 75, adapted to each purpose. In the Milan works of the Acciaierie Milanesi, two Stassano furnaces are in steady operation. At Turin the Fonderie Riunite is obtaining good results from the Bassanese furnace, which is of the arc type like the Stassano.

Of electric furnace installations employed to other industries, there is the installation at the works of Prof. Rossi, of Legnano, whose capacity was doubled in 1913. It consists of 18 furnaces of 500 kw. at 4,000 volts, used for the fixation of atmospheric nitrogen, and a small furnace of 120 kw., employed in making an alloy called "Elianite," invented by Prof. Rossi, which is fusible like iron, but absolutely unattackable by acid. In the manufacture of aluminium the Bussi Works treated in 1913 over 6,000 metric tons of bauxite, yielding 874 metric tons of metal. Of carbide, the Darfo Works, with their Keller furnaces, turned out about the same quantity as the preceding. In the neighbourhood of the Italian capital a much greater production was effected—some 34,000 metric tons (against 26,000) in the several works at Foligno, Anversa, Narni, Papigno, and Collestatte. The Foligno Works have now given up this branch of production, and devote their energies to ferro-silicon, but a new carbide factory, employing three furnaces of a total capacity of 2,250 kw., has been started at S. Giovanni Lapatoto. Calcium cyanamide is about Lastly, electric carbons are manufactured at Narni, the output in 1913 totalling 18,000 metric tons.

#### WAR ITEMS.

Electric Motor Lorry at Erith.—Messrs. Vickers, Ltd., have just put into service a 3½-ton Baker electric motor lorry in connection with their works at Erith, Kent. It is to be used for the transport of war material to Woolwich Arsenal and Dartford and for the collection of goods from the railway station the railway station.

Board of Trade Publications.—The C.I. Branch of the Board of Trade has issued No. 20 of its lists of inquiries for the sources of supply of goods for the week ended May

An Australian Charge.—Reuter's correspondent at Adelaide says that, on May 14th, Mr. Justice Gordon decided that there was no case to go before a jury in connection with the charge brought against Mr. Francis Hugh Snow, a well-known merchant, of attempting to supply copper ores to a firm in Germany. The accused will probably be prosecuted on another charge. cuted on another charge.

Carbon-making in Australia.—An Australian paper states that a company, to be known as the Australian Arc Carbons Co. Pty., Ltd., has been formed, with an authorised capital of £4,000, in 400 shares of £10 paid up, for the local manufacture of carbons of the kind extensively used for cinema shows, naval searchlights, railway arc lamps, municipal lighting, and various electrical influence machines. "In the past these have been largely imported from Germany and Austria. The secretary is Sir Alexander Peacock, 339, Collins Street, and the sole distributing agents are Messrs. Newby & King, National Mutual Buildings, Collins Street, Melbourne." Melbourne.

Russian Demand for Electric Fittings.—A Petrograd paper says that with the opening of the building season the question of the scarcity of electrical materials becomes a very acute one. The previously existing supplies of sundry accessories for installing electricity, as the demand throughout the winter was not reduced, have considerably declined, and the question now is one of making up the supplies. Local factories that engage in producing such goods are so overwhelmed with large and urgent orders that the production for stock, or for the market, is reduced to a goods are so overwhelmed with large and urgent orders that the production for stock, or for the market, is reduced to a minimum, and the Moscow factories are unable to satisfy the demand. The large increase in Customs duties is having its effect upon the prices which, for the most part, are up from 30 to 40 per cent. For want of raw material the production of batteries too has been very much curtailed. There is no carbon for arc lamps. Very satisfactory offers of installation material have been received from America, but the conditions of sale are not suitable to the Russian market. The proposals submitted at the council of electro-technicians held in January this year, to manufacture in Russia some of held in January this year, to manufacture in Russia some of the more generally used types of fittings in place of those previously imported from Germany, have not yet material-ised, because, as stated above, the Russian factories are overwhelmed with important orders. The demand at the moment is not important, but it is expected to become so in a few weeks' time.

Government Cable Contracts.—Among the Parliamentary questions, asked on May 13th, was one put to the First Commissioner of Works by Mr. Booth, who asked if Julius Hirschmann was still a director of the Union Cable Co., which received a Government contract; if he was a nominee of the Deutsche Kabelwerke A. G., Berlin; and where he was now residing. Mr. Walter Rea, in reply, stated:—"So far as the information in the possession of the Office of Works shows, Julius Hirschmann is not a director of this company. His place of residence is not known."

The following letter has come to hand just as we go to press:—"I do not know your correspondent, Mr. A. R. Munday, and have no wish to reply to his letter, but since so much publicity has been given to the matter, perhaps it is well our friends should know that five-sixths of the work we have in hand at the present moment is on direct Government contracts for various departments. So long as the Government offer us work, we shall carry on, in the belief that we are patriotic, and allow the Board of Trade and its Supervisor to look after any profits there may be. I trust you will be good enough to publish this letter.—
J. A. Blackwood (on behalf of the employés of the Union Cable Co., Ltd.), Dagenham Dock. May 19th, 1915."

The Lighting of London Streets.—At the Lambeth County

The Lighting of London Streets.—At the Lambeth County Court, before Judge Parry, on Friday, George Brown, a taxi-cab proprietor, brought an action against the Lambeth Borough Council to recover damages for injuries to a cab. It was stated that, after emerging from the glare of a shaded gas-lamp at Brixton, plaintiff was plunged into total darkness, and ran, a short distance away, into a refuge, on which was an electric arc lamp. At the time of the accident this electric lamp was out, the result being that the driver smashed the lamp column and damaged the car. Evidence was called to prove that the electric lamp on the refuge was out at the time of the accident, and that it was practically impossible for a driver to see the refuge after he had come from the glare on the road caused by the shaded gas lamp.

A police-sergeant stated that it was so dark that he had to go into the cab and turn up the light in order to make a note of the accident. Mr. Bruce Penny, Town Clerk of Lambeth, for the defence, maintained that there was no negligence on the part of the Council, inasmuch as the lighting arrangements were carried out by the gas company and the South London Electric Supply Corporation. He also pleaded that the Council was not responsible for the accident, as it was acting under the instructions of the Chief Commissioner of Police, who was responsible for the lighting of the streets under the Defence of the Realms Act. Mr. H. C. J. Edwards, the borough engineer for Lambeth, stated that the lamps had been shaded at the instigation of the police, who approved of the measures taken by him and his staff. It was desired that the lights from the lamps should be thrown on the ground, but that did not cause a glaring light. It was common knowledge that the whole of the lighting of London had been taken out of the hands of the local authorities, and that the electric arc lamp should have been in working order at the time of the accident, and for it. Evidence was given that the electric arc lamp should have been in working order at the time of the accident, and that it should have been alight, as it was found to be burning at eleven o'clock on the morning after the accident. Mr. Lever pointed out that under a recent decision in the High Courts, when a similar action was taken against the Poplar Borough Council, the Council was responsible for an accident of this nature. Judge Parry said, in view of the importance of the case, he should reserve his decision.

Limiting Municipal Expenditure in War-time.—The Finance Committee of the L.C.C. has reported to the Council at some length on the subject of the restriction of capital expenditure. The object of the Treasury is to conserve and direct into channels useful to the nation for the furtherance of the war both the capital and the labour of the nation, and it is desired by their lordships to stop or the nation, and it is desired by their lordships to stop or reduce capital expenditure by local authorities rather than merely to restrict fresh borrowing. The Committee has considered the matter in order to report what action should be taken to comply with the spirit of the Government's suggestions, and it concludes that the general principle to be observed is that all capital expenditure not necessary for the furtherance of the war should be postponed; in other words, that municipal or local interests must be subordinated to national interests. The Committee says:—"One ated to national interests. The Committee says:—"One exception only is specifically allowed, viz., urgent works connected with the public health; but the Treasury will apexception only is specifically allowed, viz., urgent works connected with the public health; but the Treasury will apparently give a somewhat broad interpretation to the expression 'furtherance of the war' which will allow of expenditure on any municipal service which, if not carried on, would hamper those engaged in industries directly concerned with military requirements. It is possible that the approval of the Treasury might be secured to expenditure on isolated purchases of property in cases in which specially favourable opportunities occur, as such expenditure makes no demand on labour, but the actual payment of the purchase money should be postponed, if possible. Further, expenditure on works in progress under existing contracts will only be allowed if, after due inquiry and consideration, it appears that such expenditure cannot be postponed or delayed." A letter from the Treasury, dated 28th April, indicates another ground—extreme urgency, which may influence them in granting sanctions, for it savs:—" With regard to the proposed expenditure of £88,000 on providing two additional turbo-generators at the Greenwich generating station, My Lords recognise that this is a service of urgent importance which cannot be deferred indefinitely, but they would ask that the London County Council should further consider whether it is not possible to postpone the expenditure consistently with sofety for (ear) six months are a year. The which cannot be deferred indefinitely, but they would ask that the London County Council should further consider whether it is not possible to postpone the expenditure consistently with safety for (say) six months or a year. They will not refuse sanction for the borrowing of the money if and when the London County Council determine that it is absolutely impossible further to postpone the expenditure." The Committee continues:—It is necessary that definite action should be taken by the Council without delay, and instructions given to committees to review the position and reconsider their annual capital estimates for 1915-16, and we submit the recommendations accordingly. We desire to refer to the action taken by the Emergency Committee on August 14th, 1914, and subsequently continued by us, subject to certain modifications, as reported to the Council on 27th April, 1915, with a view to making more frequent payments to contractors than those to which they are entitled under their contracts. The object of this action was to prevent the delay of works at a time when, as the Local Government Board, in its circular of 11th March, 1915, has pointed out, "there was reason to fear that unemployment might be widespread." The same circular urges that the position is now reversed, and that "it will be necessary to economise labour to the greatest extent possible." We have accordingly given instructions for the special arrangements referred to to be discontinued, and that no further action shall be taken under the resolution of 23rd March, 1915, which was as follows:—

That, until the conclusion of the war or during such shorter period as may be determined by the Finance Committee, in all future contracts for the execution of works of construction or manufacture with regard to which the heads of the departments concerned consider it desirable that more frequent payments than those provided for by the standing orders of the Council should be made, a provision be inserted to the effect that heads of departments shall issue certificates for weekly advances on all such contracts of less than £2,000, and for fortnightly advances on all other works contracts.

As regards sanctions to borrowings by metropolitan borough councils and loans to local authorities in London, the Comcouncils and loans to local authorities in London, the Committee proposes to deal with all such cases in accordance with the policy indicated in the letter from the Treasury, except those in which, as stated in the circular letter, dated 25th March, 1915, from the Local Government Board, that authority, and not the Treasury, is to decide whether the purpose for which the loan is required is one with which it is desirable to proceed at the present time. The Committee's recommendations include the following:—(a) That, in order to comply with the requirements of His Majesty's Treasury as regards the restriction of capital expenditure during the continuance of the war, the Council do take all possible steps to limit its capital expenditure. (b) That it be an instruction to all committees of the Council to take steps forthwith (i) to postpone or delay expenditure as far as possible under existing contracts and estimates already approved by the Council; and (ii) to refrain from submitting estimates for new proposals or works unless the same are for the furtherance of the war, or are of such urgent necessity that they must be undertaken immediately. (c) That it be instruction to all committees of the Council to recent it that they must be undertaken immediately. (c) That it be instruction to all committees of the Council to reconsider their annual capital estimates for 1915-16, in accordance with the decisions arrived at under the foregoing resolutions (a) and (b), and to forward them, as amended, to the Finance Committee at the earliest possible date.

War Service Badges and Recruiting.—Some time ago, when Messrs. E. Bennis & Co., Ltd., of Little Hulton, were officially notified by the War Office that they had been placed upon the list of firms exempted from recruiting in consequence of being engaged on war contracts, a personal letter, as under, was addressed to each of the firm's employés impressing upon them the importance of the work on which they were engaged. Those employés who were of recruitable age were requested to give a guarantee to enlist if called upon before exemption badges could be supplied. We learn that as a result of the firm's appeal over 95 per cent. of their recruitable employés applied for badges and signed the necessary guarantee: signed the necessary guarantee:

#### GOVERNMENT CONTRACTS.

GOVERNMENT CONTRACTS.

We have received official intimation from the War Office that this firm has been placed on the list of those exempted from recruiting during the period that we have armament contracts on hand.

We are in a position now to obtain war badges for those of our employes who are of recruitable age (between 18 and 38), and these we can obtain from the War Office upon each man or youth signing an application form, which can be obtained in the time office during the dinner-hour or at 5.30 p.m.

We take this opportunity of pointing out to our employes that we have large contracts in hand for mechanical stokers, coal elevators, conveyors, ash handling plants, etc., for several ammunition and powder factories that are being put up with all possible speed by the Government, quite 80 per cent. of our work now being of this character.

The present orders cover several months' work, and as we are under stringent guarantees as regards deliveries, the speed at which we turn out these orders and the quality of the work will control the placing of further War Office orders which we have at present under negotiation.

We, therefore, trust each man will realise his responsibility and assist the Government in their urgent need for war munitions by attending to his duties regularly and conscientiously, avoiding broken time, and getting through his work as speedily as possible, thus enabling aus to execute the work we have undertaken within the times guaranteed.

It is our opinion that the men at home engaged in output of war munitions have as responsible and important duties to perform as have their brothers in the trenches, as it is only by their unselfish co-operation that our soldiers can be kept well supplied with ammunition, now so urgently necessary to bring this unfortunate war to a speedy and satisfactory end.

We appeal to your chivalry and patriotism, and we do not think we shall appead in vain.

For EDWARD BENNIS & CO., LTD.,

EDWARD BENNIS, Managing Director.

Personal.—Mr. S. C. Hurry, of the Sheffield Corporation electricity scaff, has been granted a commission as a second-lieutenant in the Royal Engineers' Signal Section. He has been at the front as a motor cyclist dispatch rider attached to the Cavalry Division.

Mr. Tom Sumner, electrician, of Hulton, Bolton, owes his escape from the "Lusitania" to his capabilities as a swimmer. After two years in Canada and the States as an electrician, he decided to return home recently, and booked his passage on the "Lusitania." He was on deck smoking when the first torpedo struck the ship. From the explosion, splinters flew over him. He rushed down for a lifebelt, slid down a line into the sea, and struck away just as he saw the foam of the second torpedo. He away just as he saw the foam of the second torpedo. He remained in the water three hours before he was picked up.

Lieut, C. L. Faunthorpe has accepted a commission in the 9th West Kent Regiment. For years he has been secretary of Blackburn Civilian Rifle Club. Lieut, Faunthorpe holds a position on the staff of Blackburn Electricity Works.

Mr. Percy Taylor, assistant electrical engineer to Darwen Corporation, has enlisted in the motor transport service. He left for Coventry on May 18th.

Mr. Jones, an electrician on the "Lusitania," was among the saved.

the saved.

The "London Gazette" contains the following notice:—
"Admiralty, May 12th. Royal Marines, Submarine Miners—Captain George Arthur Bruce; Tyne Electrical Engineers, Royal Engineers, Territorial Force, is granted a temporary commission as a Captain, and to remain seconded in his unit. Dated April 1st."

Roll of Honour,-Sub-Lieutenant E. B. Trimmer, Paisley, is reported to have been wounded at the Dardan-elles. Previous to the war he had charge of the electricity generating station at the Anchor Thread Mills.

Private John Francis Hobson, of Stalybridge, formerly employed at the generating station in Tame Valley, has died from wounds received in action.

It is with deep regret that we read in the "Times" that Second-Lieut. Stanley Bastian, 4th Seaforth Highlanders, the only son of Mr. C. Orme Bastian, was killed in France on May 9th. The deceased, who was 23 years of age, was, until the outbreak of war, engaged in the service of Messrs. Dick, Kerr & Co., Ltd., preparing for a commercial career. He enlisted last September, and went to the front early in November. Mr. C. O. Bastian's numerous friends in the electrical world will, we are sure, desire to join us in an expression of deep sympathy with him and Mrs. Bastian in their loss

Private Arthur Baker, of the 8th Warwicks, who was employed at the Moseley Road depôt of the Birmingham Tramways Department up to the outbreak of war, has been wounded, and is at the Military Hospital, Kent.

# CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### Wireless Control of Public Clocks.

I have observed a paragraph under the above heading on

I have observed a paragraph under the above heading on page 624 of your issue of the 30th ult., which I recognise as an extract from a criticism by Mr. Hope-Jones, which was published in the March issue of the Horological Journal.

In fairness to myself, I should like to state that a complete answer to Mr. Hope-Jones's criticism appeared in the April issue of the journal in question. I would also point out that the date of issue of the Horological Journal in which my answer appeared was April 9th, and that my article did not appear in the Electrical Review until April 16th.

It is a pity, I think, that your correspondent did not see the April issue of the Horological Journal before sending you the extract from the March issue, because he would have seen that Mr. Hope-Jones's condemnation was founded chiefly on an erroneous idea of the subject.

an erroneous idea of the subject.

an erroneous idea of the subject.

Further, the proposal to install a receiving apparatus does away with the principle of obtaining "collective" control, which is the very marrow of a well-appointed time service. A receiving apparatus could certainly be added to my scheme, but wireless control from a central point would still be required to enable a responsible individual to know that the clocks were really to time. were really to time.

The last paragraph of the extract is not a literal reproduction of the statement which appeared in the original. The paragraph as it appears is misleading, and gives the impression that no licence has been necessary for receiving wireless I would respectfully point out that the Postmastersignals. I would respectfully point out that the Fostmasier-General's licence has always been necessary for receiving wire-less signals, as well as for transmitting them.

Alfred E. Ball.

Leicester, May 17th, 1915.

[An extract from Mr. Ball's reply to Mr. Hope-Jones was published on p. 712 of our last issue; evidently our correspondent has overlooked this.—Eds. Elec. Rev.]

# Photo-Printing Charges: Preferential Terms.

In your issue dated the 2nd ult. you published in your In your issue dated the 2nd ult, you published in your columns a letter of mine, wherein I explained that the Ilkeston Corporation had instructed Mr. S. F. James, the Town Clerk, to state a case for the opinion of counsel (Mr. W. C. Tyldesley Jenes) as to whether it is legal to supply energy for photoprinting purposes at the same rates as charged for power.

Your readers will remember that in my letter I also pointed out that in reply to questions of mine, the Local Government Board wrote: "The Board are not aware of any provision in the general law upon the subject and are not aware of any

Board wrote: "The Board are not aware of any provision in the general law upon the subject and are not aware of any decisions of the Courts upon the point." I might also add that in connection with this electricity question I resigned my position as Chairman of the Tramways and Electricity Committee.

The position now is that counsel's opinion has been received since the beginning of April, but it has not yet been made public. The Town Clerk read the opinion at the meeting of the Electricity Committee, but would not permit the writer to take a copy nor any extracts unless an undertaking were given to keep the matter strictly private, which the writer

declined to do.

Surely it is not necessary in this particular case that such

Surely its not necessary in this particular case that such secrecy should be demanded.

This is not a purely local question, but a matter affecting hundreds of Corporations and scores of trades—other than photographers—throughout the country.

Again, counsel's opinion has been taken at the expense of the ratepayers, and as no litigation is in contemplation, is it not reasonable that the ratepayers should be allowed to know the views of counsel, especially as the charges for energy to the photographers of likeston have recently been advanced from power rates to lighting rates, on the plea that it is illegal to supply for photo-printing purposes at power rates?

If you or any of your readers will express their views on the point as to the necessity of keeping strictly private and confidential the opinion of counsel in this particular case I shall be pleased.

be pleased.

(Coun.) William Smith.

Ilkeston, May 14th, 1915.

[We have already pointed out that the Corporation has the right to fix any scale of charges for energy used for photo-printing that it pleases; if the scale happens to coincide with the charges for power, that does not imply that there is any connection between the two. We see no reason why the opinion of counsel should be kept secret, but that is a matter which, of course, is within the discretion of the Committee. Eds. Elec. Rev.]

#### Automatic-Lift Accidents.

In reference to Mr. Broadbent's article on lift-door locks appearing in your issue of May 14th, all lift engineers will appreciate the difficulties he refers to. Undoubtedly collapsible gates are very convenient, but with the necessarily open spaces between the pickets it becomes difficult to prevent the kind of tampering with the locks referred to. We consider but we have spaces between the pickets it becomes difficult to prevent the kind of tampering with the locks referred to. We consider it is preferable to lock such gates at the centre, but we have standardised an attachment to our lock whereby the releasing mechanism is, as he suggests, placed near the top of the gate frame, to put it as far out of reach as possible. We entirely agree with Mr. Broadbent's contention that the addition of complicated apparatus which is not essential is likely in the end to be more trouble than it is worth, but we have quite a number of lifts working in which the doors or gates are actually locked before the lift moves away from a landing, and the doors remain locked while it is passing; this applies equally to automatic control as to what is known as car switch control. In such cases, if a fault developed in the lock attention would be called to it by the refusal of the lift to start.

Of course, in these days of severe competition there is bound to be a difference in the quality of the various mechanisms which go to make up a lift, but we consider that too much care cannot be given to devices such as are used for the locking of the gates, seeing how much is dependent upon their proper working. The use of a second catch for the locking lever, which we always fit, should have prevented the even remote possibility of opening the gate to which Mr. Broadbent refers, provided, of course, that the locks and other apparatus were in working order.

were in working order.

H. HABMSWORTH, Director and Sales Manager.

London, S.E., May 17th, 1915.

# Trade After the War.

If you will grant me the space I would like to say that I think Mr. Edward Bergtheil's letter in your current issue very apt; with the exception that most business houses, as he suggests, do not know exactly how to begin on the overseas campaign. Provided a person or business man has seen a bit of the world outside his own native island, the problem of getting a good hold in respect of the overseas ex-Austro-German trade is fairly easy. The people, however, who might move seem mentally lethargic—in fact, one cannot kick them into animation, and I have been at it since the second week in August! in August!

I may add, by way of explanation, that three trade associa-I may add, by way of explanation, that three trade associations have had my services in the past (two British and one American), and, in addition, on behalf of British and foreign firms I have either travelled or been in France, Belgium, Germany, Austria, Russia, Turkey, part of Persia, U.S.A., etc., so do not speak without my book. With this and much other experience behind me, it is clear to me that any British firm which has already an overseas connection should develop it from the overseas pitch either by suitable and more energetic salesmanship, by local publicity work (a most important item) salesmanship, by local publicity work (a most important item), or by a thorough investigation of the requirements in goods or by a thorough investigation of the requirements in goods and terms of the overseas place or places. If a firm has no overseas depôts, well, let it get suitable agents, but first see that they are suitable, and get them to disclose their successful activities in the past, and then go by their advice as to goods, literature and service required, so that if there is to be a fault, it may be theirs, and not that of the home manufacturer.

As a very fair enthusiast, as well as a cosmopolitan business wanderer (though, unfortunately, nothing of a linguist). I will be most happy to write a lengthy and more detailed general letter on the above subject if your readers show any interest.

Cab Signalling.

As one who has carefully studied railway signalling methods

As one who has carefully studied railway signalling methods in four countries for more than ten years, I wish to commend as strongly as possible Mr. Ogden's thoroughly sound and accurate criticisms in your current edition. From the public safety point of view, it would have been all the better for Mr. Ogden to have extended his critique to include the other grave mistakes Mr. Acfield makes concerning electrical signalling. On every point in dispute between the two writers Mr. Ogden is right and Mr. Acfield is wrong.

Track circuiting certainly was not "introduced into railway signalling in the past few years." I travelled under track-circuit protection more than fourteen years ago, and such circuits had then been in regular service for more than fourteen years. No valid reason can be given for the fact that, as to track circuiting, British steam railways are so many years behind those American railroads which operate under the same conditions. British steam railways would be signalled more economically and far more safely if antiquated mechanical devices were superseded by modern electrical apparatus. apparatus.

Mr. Acfield would have been less misleading if he had paid

appropriate attention to the serious objections peculiar to A.C. track circuits. It is questionable whether the undoubted advantages of this class of circuits, when considered in connection with their marked disadvantages, are sufficient to warrant the optimistic opinion he expresses. The three-wire track circuit certainly seems to offer very decided advantages

over the A.C.

track circuit certainly seems to offer very decided advantages over the A.C.

In asserting that the Railophone "is undoubtedly designed on right lines," Mr. Acfield is utterly wrong, as I have several times proved in the technical Press and in lectures to technical meetings in London, Birmingham, Sheffield, and elsewhere. According to published descriptions, the test (?) of this toy on the Midland Railway is a very frivolous waste of time. For instance, at least two illustrated articles (neither of them by me) in the Press show the Midland "tests" as proceeding under the conditions that two distant signals on tracks of opposite traffic are about twice the requisite viewing distance apart, that there is not a home arm on the same pole with either distant, and that there is no intervening home or distant signal for either track. Mr. Acfield knows quite well that this combination of conditions does not occur one time in a hundred. It would certainly be interesting for Mr. Acfield to inform your readers, by the aid of circuit diagrams, as to how he would extend the Midland Railophone installation so as to take care of the case of a double-track junction with a four-track route.

Every wireless cab system, whether Faradic or Hertzian,

junction with a four-track route.

Every wireless cab system, whether Faradic or Hertzian, that has ever been publicly proposed is designed on lines that are decidedly wrong. The very fact that the action is "wireless"—i.e., radiative—connotes a dangerous tendency inherent in such systems, but entirely absent from electrical ramp systems. The wireless impulse tries as hard to go to the wrong locomotive as it does to go to the right one; but the same is not true of the conducted—and non-radiative—incoming in the ramp systems.

impulse in the ramp systems.

Wm. H. Dammond.

Nottingham, May 15th, 1915.

# The Engineering Industry and the War.

The statements contained in my letter of May 7th are entirely correct. I did not give weight of the human heart, but capacity and industrial performance.

J. Sutherland Warner, A.M.I.Mech.E.

London, W., May 15th, 1915.

Electrical Standards. — Mr. H. M. Hobert and Mr. C. E. Skinner, who were sent to London as delegates from the American Institute of Electrical Engineers to confer with the Standards Committee of the Institution of Electrical Engineers of Great Britain in February, completed their work on March 25th, and were to make their formal report to the Standards Committee of the A.I.E.E. on May 7th. It is understood that their mission was successful, and that substantial agreement between the standards of the two countries has been reached. Sir John Snell, president of the Institution of Electrical Engineers, formally welcomed the delegates, and Dr. R. T. Glazebrook, director of the National Physical Laboratory, acted as chairman of the conferences, which were held at the home of the Institution of Civil Engineers in London. Every possible courtesy was shown to the American delegates, and there was ample evidence of the exprest desire of the British Standards Committee to arrive at a complete agreement. It is expected that through their study of both sets of rules with the British Committee the delegates will be able to make important suggestions for the olarification of the American rules. It is also thought that they will make certain recommendations for changes in the American rules in order to arrive at closer agreement than would otherwise have been possible. While there probably will still be minor differences to be settled, and while the warding of the two sets of rules will be different in Electrical Standards. - Mr. H. M. Hobart and Mr. while the wording of the two sets of rules will be different in many respects, it is expected that in all essential points the machinery built in accordance with either set of standards will fulfil the same specifications.—Electrical World.

# BUSINESS NOTES.

Consular Notes.—CHINA.—The American Consul at Peking reports that at a recent meeting of the American Association of North China a resolution was passed asking American manufacturers of machinery to follow the practice of British manufacturers in sending machinery to Chinese technical schools and universities for their use as a means of advertising American machinery and bringing it into favour with the Chinese students, who are accounted their familiarity with the machinery during who, on account of their familiarity with the machinery during their school days, will be inclined to favour its use in fields to which they may be called later in life. A committee was appointed to draw up a list of the kinds of machinery in demand, and of the institutions to which they could advantageously be

"The opportunity for the introduction of cheaper grades of electrical supplies in the Hong-Kong field growing out of the closing of the trade to German manufacturers as a result of the war, is being taken advantage of by Japanese manufacturers, and many lines of electrical goods are coming into this market from that country. There are three well-equipped factories for such goods in Japan, according to Hong-Kong importers concerned in this trade, and all of them have carried on an active campaign in behalf of their goods, which include practically all lines of ordinary electrical supplies, aside from electrical machinary and the finer grades of electrical apparatus. Prices are much lower than those for American goods answering the same purpose, though the American goods are much superior in quality. The nature of the trade is indicated by the fact that one company imports filaments for incandescent lamps from the United States and manufactures the lamps in Japan, the lamps selling here for about 15 cents gold wholesale. These lamps lack the life and the efficiency of the American or European lamp competing with them, but they attract a considerable trade and supplant, for the time being at least, the better grade lamps manufactured in Europe or the United States. The situation is similar as regards the trade in insulated wire, fuses, porcelain insulators, globes, and similar accessories. The Japanese may almost be said to control the market in some of these lines at present. A curious phase of the trade is that the Chinese importers usually prefer to buy such Japanese goods through foreign houses in Hong-Kong, thus adding a profit to the cost, but avoiding transactions with Japan direct. Prices in some of these goods from Japan run almost 50 per cent. cheaper than goods from the United States or Europe. The hope of future trade, however, lies in the poor grade of the goods and the consequent expense and trouble of early renewal. In a general way only high-grade goods will stand the climate in the hong-Kong, and HONG-KONG,—The American Consul at Hong-Kong reports: "The opportunity for the introduction of cheaper grades of elec-

Book Notices .- How to Cook by Electricity .- By Amy Cross and Alys Waterman. London: Lake, Sison & Brown, Ltd. Price 9d.—This little book consists of 13 pages about electric cooking, and 53 pages of tested recipes, the latter numbering 100, and covering a wide range of dishes. The talented authoresess lead off with eight good reasons for the growing popularity of cooking by electricity, and proceed to show that good oven cooking is essentially a scientific operation; to reproduce the best results with cartainty, the use of the thermometer is indispensable. A thermometer, however, is useless when applied to an oven through which there is a current of air, such as a gas oven of the usual thermometer, however, is useless when applied to an oven throngs which there is a current of air, such as a gas oven of the usual type, as the temperature cannot be correctly ascertained. With an electric oven, fitted with a thermometer, it is now possible for domestic cookery to be done on scientific lines and with the certainty of successful results. There is only one obstacle to the production of recipe books with definite directions for the times and temperatures to be employed—namely, the absence of standardisa-tion, to which we have repeatedly drawn attention. Hence, while the writers give in their recipes the temperatures which they have proved satisfactory with most of the best ovens on the market, they suggest that the reader shall make a note of the temperatures she finds best with her own oven, and a space is left for this pur pose after each recipe. Once this is done, success is certain. All the recipes given are for oven work, because the recipes found in any cookery book may be used for boiled, grilled and fried disher. A variety of information is included regarding the use of switches, hot plates, saucepans, grills, &c., and about baking, cleaning, and not plates, saucepans, grills, &c., and about baking, cleaning, and using the oven without a thermometer. It is pointed out that he very best results in cooking meat are obtained by using moderate temperatures for a longer time than is customary, and that great economies can be effected by cooking with the reserve heat of the oven after shutting off the current. We feel sure that this book, tersely written in plain language and with convincing commonsense, will be heartily welcomed by electric cooks and by supply station authorities.

station authorities.

"Journal of the Institution of Electrical Engineers." Vol. LIII,

Landon: E. & F. N. Spon, Ltd. Price 3s. 6d. No. 248. May 15th. London: E. & F. N. Spon, Ltd. Price 3s. 6d.

—This issue contains a paper on "The Bombay Hydro-Electric Scheme," by Alfred Dickinson, as well as the Report of the Council for 1914-15, the annual and Benevolent Fund accounts, and the papers set in the examination for Associate Membership.

Electric Mining Regulations and Data is the title of a useful little handbook just issued, after revision, by Messre. W. T. Glover and Co., Ltd., of Trafford Park, Manchester. It brings together in convenient form the Home Office Regulations and Memorandum, as revised in March, 1914, and a selection of data and formulæ, with a section illustrating the firm's cables and accessories designed to comply with the regulations. It is a neat and well got-up booklet, and should be welcomed by colliery engineers.

War Service. — Messrs. Berry, Skinner & Co. ask us to request contractors in the electrical trade requiring their us to request contractors in the electrical trade requiring their switchgear to anticipate their requirements as much as possible. They say:—"It is of paramount importance, when delivery cannot be reasonably anticipated, to mention with the order if, and when, required for war service, with sufficient details so that preference may be obtained, not only with the railway companies, but, when necessary, with the suppliers of raw material and component parts. War service orders take precedence of everything, and are delivered in strict rotation as received, except by special order of the Government." Government."

Liquidations and Dissolutions.—THE COMBINATION GAS STEAM ENGINE SYNDICATE, LTD.—A meeting is called for June 15th, at 2 and 3, West Street, Finsbury Circus, E.C., to hear an account of the winding up from the liquidator, Mr. W. F.

VIVIAN YOUNGER & BOND, metal brokers and merchants, 7, Gracechurch Street, E.C.—Messrs. C. L. Budd, W. C. Bond and J. A. Amschel have dissolved partnership so far as Mr. J. A. Amschel is concerned.

PATENT EXPLOITATION TRUST, LTD., Finsbury House, Blomfield Street, E.C.—First meetings of creditors and contributories June 1st at Carey Street, W.C.

Large Electric Furnaces.—Referring to the article on large electric furnaces for foundry work which appeared in our last issue, Mr. G. J. Stook, of The Villas, Middleton St. George, Co. Durham, informs us that he represents the makers of the furnace in question (the Snyder Electric Furnace Co.) in this country, and has sent us some brochures describing the apparatus.

Private Arrangements.—Frank Thornton & Co., electrical engineers and contractors, Bridge Street, Burnley.— The creditors interested herein were called together last week The creditors interested herein were called together last week when a statement of affairs was presented which showed liabilities of £921. The assets were estimated to realise £1,085, from which had to be deducted £53 for preferential claims, leaving net assets of £1,032, or a surplus of assets over liabilities of £10. The book debts (£370) were said to be practically all good, while for the purposes of the statement the stock (£649) had been taken at cost or under. Owing to the rising prices the stock was really worth 25 per cent. more. A sum of £200 had been spent in fitting up the premises, which were well adapted for the purposes of the business. It was anticipated, however, that if a realisation took place, not more than £60 would be realised for the fittings and fixtures. The present position had been brought about by shortness of working capital and by the fact that the Corporation had issued notices to the effect that no further mains or services were to be laid down. As a result, the business of the firm had been restricted. After discussing the position, it was decided that a deed of inspectorship should be executed and a committee of three of the principal oreditors was also elected. The following are creditors:

Electrical Co., Ltd. . . . . £88 Hodgson, S., & Co. . . . . . . . . £1

Trade Announcements.—Messrs. Invetrol Light-Ing, LTD., of Invetrol Works, Bracebridge Street, Birmingham, have recently added to their business a new department for the manufacture of electric pocket batteries. It is in charge of an expert, who, we are informed, has had many years' experience in this line with leading battery manufacturers in this country. A leafist has been issued briefly referring to the "Invetrol" "H.P." (high power) dry battery.

MESSRS, A. SEAGE & Co. announce that their works at Hammersmith will be entirely closed from 22nd to 31st inst., as they are removing to larger premises owing to increased business and lack of facilities for extensions. The new works, which have three times the floor space of the old, are at Railway Approach, Prebend Gardens, Hammersmith, W. New telephone number: "Hammersmith 613."

THE HEBBERT FROOD Co., LTD., have appointed Messrs. Hitchen-Blakie, Ltd., of 28, Cathedral Street, Manchester, sole agents for Lancashire, Yorkshire, Cheshire and North Wales, and they will carry stocks of Ferodo clutch and brake linings.

THE NORMAN ELECTRICAL AGENCIES, of 70, Great Portland Street, London, W., have been appointed sole selling agents by Messrs. Pitter's Ventilating and Engineering Co. for the sale of their multiblade desk fans.

Bankruptcy Proceedings .- J. W. JARVIS, electrician, 3, Devon Place, Edinburgh.—The estates of J. W. Jarvis were sequestrated by the Sheriff on May 11th. A meeting is called for to-day at 18, George Street, Edinburgh, to elect the trustee and commissioners. A composition may be offered at this meeting. The Scatsman states that the application for warrant to sequestrate the estate was made by Mr. James Scott, S.S.C., at Edinburgh Bankruptcy Court, on 11th inst., in order to obtain payment of a debt of £29. Granting of the warrant was opposed by the respondent or the grounds that he was unable to pay, that he was liable to be called up for active service at any moment, and that he expected to be able to pay his debts at the conclusion of the war. The debts represented legal fees in proceedings in which the respondent had obtained divorce from his previous wife. Within five weeks the married earlie but had not wide his leaves the but he war.

had obtained divorce from his previous wife. Within five weeks he married again, but had not paid his lawyer's bill. Sheriff-Substitute Orphoot granted the application.

G. J. T. J. PARFITT, consulting electrical engineer, 11, Priory Road, Keynsham, near Bristol, Somerset.—The adjourned public examination of this debtor was held at the Guildhall, Bristol, last week, before Mr. Registrar Wright, who declared the case closed.

T. Moore, electrical engineer, Headingley, Leeds.—Trustee (Mr. H. C. Bowling, Official Receiver, 24, Bond Street, Leeds) released March 15th, 1915.

G. E. HEPKINS, electrical engineer. Dudley.—Last day for proofs

G. E. HEPKINS, electrical engineer, Dudley.—Last day for proofs for dividend, June 1st. Trustee, Mr. A. M. Fairbairn; Official Receiver, 1, Priory Street, Dudley.

and Lists.—Mr. H. C. JEFFCOAT, Catalogues 18, Ranelagh Gardens, Hammersmith, London, W.—Price leaflet of "Lamlock" lampholders.

SUN ELECTRICAL Co., LTD., 118 and 120, Charing Cross Road, Loadon, W.C.—Three new illustrated priced leaflets for the trade. No. 266 gives particulars of the "Change-Ad" electric sign service; No. 267 deals with a new range of "Sunlite" porcelain enamelled reflectors for half-watt lamps; and No. 268 describes portable electric drills, an electric grinder for machine shops, and

portable electric drills, an electric grinder for machine shops, and an electric buffer for motor garages.

MESSES. SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham.

—New conduit catalogue of between 170 and 180 pages, containing those sections of the firm's catalogue dealing with conduits, conduit fittings, distribution boards, fuses, switchgear, watertight fittings, and cables. The list has been rearranged to a more convenient size; many new fittings and devices have been introduced; engineers and contractors can have copies of the publication on application.

engineers and contractors can have copies of the publication on application.

THE STEEL BARREL Co., Ltd., Phoenix Wharf, Uxbridge.—
Souvenir illustrated pamphlet of 32 pages, containing some information concerning the company and its works, and the steel barrels, casks, pipes, tanks, &c., which it manufactures.

GENERAL ELECTRIC Co., Ltd., 67, Queen Victoria Street, London, E.C.—New price-list of Osram drawn-wire lamps. "Atmostype," 100 to 1,500 watts, and for various voltages from 50 to 255.

or Sale. - Four thousand pairs Conradty carbons for open type lamps and 2 cwt. short ends, also 150 round glass globes for street lighting. Particulars are given in our advertisement

An Australian Contract.—It is reported in the newspapers that MESSES. NORTON, GRIFFITHS & Co. have entered into a £10,000,000 contract with the New South Wales Government for railways, water conservation, harbour and irrigation works, the expenditure to be spread over five years from July, 1915.

# LIGHTING and POWER NOTES.

Accrington.—YEAR'S WORKING.—A loss of £3,073 is recorded on the year's working of the electricity undertaking. The gross revenue amounted to £28,802, a decrease of £1,124, and the gross expenditure to £21,613, an increase of £3,634. Some 6,340,000 units were sold, as compared with 5,850,000 units in the previous year, the power supply, excluding tramways, accounting for 4,113,000 units.

Arbroath.—Street Lighting.—The T.C.'s agreement for street lighting with the Arbroath Electric Light and Power Co. expires in August next, and the company is to be asked on what terms it will renew the agreement.

Ashton-under-Lyne. — Subject to permission being obtained from Hurst U.D.C., the T.C. has acceded to an application from Messrs. Jas. Howe, Ltd., for a supply of current to Mount Mill, Hurst.

Australia.—According to the Sydney Daily Telegraph a large up-to-date electrical plant is being installed at Mount Pleasant Colliery, on the South Coast, at an estimated cost of £35,000. The installation will consist of three alternators coupled to steam engines, each capable of developing 140 kW. at 6,600 volts. The power will be applied to various purposes connected with the working of the colliery, about three miles distant. The main heading will be illuminated with electricity, and a new haulage house at the pit mouth will contain one of the largest endless rope haulage sets in the Southern hemisphere, capable of hauling 1.200 tone of coal ner day. 1,200 tons of coal per day.

Aylesbury.—Public Lighting, &c.—The U.D.C. has agreed to have the Market Square lit by electricity, at a cost of £170; to give a day supply of 50 H.P. to the Dominion Dairy Co., at 1[†]d. per unit, and to purchase a 20-ton barge of fuel oil, at £3 13s. 6d. per ton.

Barnes ... YEAR'S WORKING .- The result of the past ear's working of the electricity undertaking shows a net profit of £1.765, as against £3,214 in the previous year. This decrease is attributed solely to the war. In view of the restricted lighting order the Electricity Committee has reduced the street lighting account by £57 in respect of the past quarter.

Barnsley.—Proposed Extensions.—The Electricity Committee recommends that the Council approve of the scheme for extensions to the electricity works, at a cost of £21,850, and that application be made to the L.G.B. for borrowing powers. The Committee also recommends that the Corporation scale of grants be not applicable to men joining the Army Service Corps.

Blackpool.—PRICE INCREASE.—From the commencement of the September quarter all electricity tariffs are to be advanced 10 per cent.

-Prov. Order.—The B. of T. has granted to Boston.-Mr. Robert Arthur Smith, of Westminster, a prov. order for E L. within the borough, and at Skirbeck, Skirbeck Quarter, Fishtoft, Freeston, Wyberton, Frampton, and Kirton, in the area of the R.D.C. The T.C. is to have the option of purchasing the undertaking at the end of stated periods, but the order is not to come into force until the end of the war.

The L.G.B. has agreed to sanction a loan for a refuse destructor, but it is not to be taken underious the duration of the war.

but it is not to be taken up during the duration of the war.

Bradford.—The profit of the electricity department for the past year has been £12,000, and £7,500 is proposed as a contribution to the relief of the rates.

Carshalton.—Refuse Destructor.—The U.D.C. has referred to the Sanitary Committee the question of approaching the Beddington and Wallington U.D.C.'s, with a view to the provision of a refuse destructor for use for the three parishes.

Croydon.—The borough electrical engineer reports that in considering necessary extensions for next winter's supply he would, in the ordinary course, have recommended works in an outlay of £3,500, but, owing to shortage of labour and L.G.B. restrictions, he advises only works of imperative necessity—viz., extensions of cables, at a cost of £498. The recommendations have been adopted by the Council.

Dover. — Correction. — We regret to find that the second paragraph appearing under "Dover" heading last week found its way there in error. The information related to another borough, not to Dover.

East Sussex.—Asylum Lighting.—The C.C. has, in consequence of enhanced prices of materials and difficulty of delivery, decided not to have the electrical storage battery at the Asylum renewed, but to install a smaller complete engine and dynamo set. The new scheme, it is anticipated, will cost less than the £900 allowed for the renewal of the battery, and will reduce the running and maintenance cost.

Gravesend.—The T.C. has sanctioned three extensions of mains, one to supply current to the factory of the Associated Portland Cement Manufacturers, and another to Wombwell Hall.

-A loss of £927 was sustained on the working Hevwood.of the electricity undertaking for the year ended March 31st, 1915.

Owing to the high prices of fuel the charges for electricity are to be increased 10 per cent. from May 1st, 1915.

Hove.—The T.C. has decided to extend the mains to Portland Road Schools, now used as a military hospital, at a cost of about £387, provided the War Office bears the cost of the extension.

India.—The new electric power scheme for Darjeeling, which was formulated by the late engineer to the municipality, by which was formulated by the late engineer to the municipality, by which current was to be supplied to the two cantonments of Lebong and Jellapahar and outlying places, is being held in abeyance pending a report from Mr. Stoneybridge, whose services have been engaged by the municipality for the consideration of a larger scheme. The present intention is to establish three or more power stations on the Mahanady River at Phulbazar, and on the Tista, near Geljhora, four miles from the Tista Bridge. It is believed that with such a scheme in operation the needs of the tea gardens throughout the district right down to Dim Dimma, and those on the Nepal border as far down as Nuxalbaria including the those on the Nepal border as far down as Nuxalbarie, including the town of Siliguri, would be amply met.—Indiaman.

keighley.—Prov. Order.—The B. of T. has granted a prov. order, for inclusion in a confirmation Bill, authorising the Corporation to supply electricity to places in Oakworth, Oxenhops, and Keighley rural district, except East and West Morton.

Leigh.—LOAN SANCTION.—In reference to the paragraph in our last issue concerning the delay to Government contracts suffered by the Anchor Cable Co., and the steps taken to deal with the matter, it is now announced that the L.G.B. has sanctioned, without inquiry, the borrowing of the money necessary for the extensions at the electricity works.

London.—The Shoreditch B.C. is recommended to make application to the L.C.C. for sanction to a loan of £1,500 for house

application to the L.C.C. for sanction to a loan of £1,500 for house services, mains, &c.

BERMONDSEY.—The Electricity Committee has further considered the question of altering the stokers of the three Howden boilers at the generating station, and has received an additional scheme submitted by Babcock & Wilcox, Ltd., for providing a chain-grate stoker to each boiler, the cost of which would be £400 per boiler, plus £130 for the driving gear and motor for all three, making a total of £1,330, or a saving of £428 as compared with the previous scheme. The Committee reports that it has adopted this scheme in preference to the more expensive one. this scheme in preference to the more expensive one.

L.C.C.—The conference to the more expensive one.

L.C.C.—The conference, mentioned in our last issue as being convened by the L.C.O. to discuss the question of London's electricity supply, was held on Wednesday, practically every borough council and supply company being represented.

Manchester.—Barton Scheme Inquiry.—The electricity department of the Corporation is hopeful that it will be able to convince the Treasury of the pressing need for an extension of its generating plant by the commencement forthwith of the erection of the new generating station at Barton, at a cost, approximately, of £768,000. As a result of representations made by the Electricity Committee, the L.G.B. has decided to hold a public inquiry to-day.

Mansfield Woodhouse.—The U.D.C. has consented to Mansfield T.C. erecting overhead lines in the district for the transmission of current to Clipstone Military Camp.

Market Weighton.—E.L. SCHEME.—The Pocklington R.D.C. has given consent for the E.L. scheme submitted by Mr. C. H. Best, of Bradford, to be commenced. Mr. Best informed the Council that the scheme will be proceeded with if certain financial support is secured to assist local efforts.

Swansea. - STREET LIGHTING, &c .- The Lighting Committee of the T.C. is considering a proposal for lighting a portion of Neath Road with 300-c.p. incandescent lamps attached to each of Neath Road with 300-C.P. incandescent lamps attached to each alternate tramway pole and fed by an overhead wire, at a cost of £1,500. The electrical engineer has reported as to the running of a new feeder from the electricity works to Morriston. The consideration of the matter has been deferred. The Committee has approved the suggestion of a local firm (which intends to sell electric cars), that the department should supply current for charging electric cars at low rates, and has decided to charge all betteries on the restricted hour rate of 11d per unit with a minibatteries on the restricted hour rate of  $1_0^1$ d. per unit, with a minimum sum of £2 per service per annum.

Slaithwaite.—The Electricity Committee has deferred consideration of the specifications of the proposed electric lighting plant.

# TRAMWAY and RAILWAY NOTES.

- ELECTRICALLY-PROPELLED DUST VANS. An offer of Edison Accumulators, Ltd., owing to the fact that L.G.B. sanction to the loan could not be obtained, to accept payment in four annual amounts of £1,060 each for the vans, proposed to be purchased by the Council, has been declined.

Bolton.—Various improvements in the track have now been completed in parts of the Corporation's tramway system. The suggestion of extending the system from Deane to Westhoughton appears to have been shelved indefinitely.

Bradford. - EMPLOYES AT THE FRONT. - The number of Corporation employés who have enlisted for war service is 701, equal to about 10 per cent., and of these the largest number has been contributed by the tramway department, which has sent 215 men, 7 of whom had been killed and 23 wounded, so far as is known at present. The total number of Corporation employés known to have been killed is 14, wounded 44, and prisoners in Germany about half a dozen.

The approximate profit for the year in the Corporation tramway department was £27,500, as compared with £29,500 in the previous year, and it is proposed to put £25,000 to relief of rates.

(lifton (Lancs.).—An agitation has again been set on foot for securing the linking up of the South Lancashire Tramway Co.'s system at Clifton with the Salford Corporation's lines at Pendlebury. The Kearsley District Council has appointed a deputation to represent its interests in the matter.

-According to Dutch reports. Continental.—Belgium. an Allied airman recently dropped a bomb on an electric car at Ostend, killing 24 soldiers.

Croydon.—The B.C. has adopted the following resolutions passed at a conference of managers of the tramway undertakings within the metropolitan area held on May 7th :- (1) That rays revenue cannot be improved by increasing fares generally; (2) That joint action should be taken by the tramway authorities in the metropolitan area, to obtain more equitable treatment for tramways in respect of rates and the upkeep of roads; (3) That powers should be obtained to jointly run omnibus services. There are 119 Croydon tramway employés now with the Colours, or 30 per cent. The London strike was reported to have caused a material reduction of tramway receipts in Croydon.

East Ham, -The Tramways Committee proposes to negotiate with the Barking District Council for the purchase of two of the latter's tramcars.

Heywood.—YEAR'S WORKING.—For the year ended March 31st last, there was a loss of £1,042 on the tramways undertaking. This is attributed to decreased earnings owing to the war, and to heavy expenditure on repairs to track.

Ipswich.—Female Labour.—The T.C. has arranged to release a number of tramway conductors to be employed in the manufacture of munitions of war, and to employ in their stead females over the age of 21 years, who will be paid 22s. per week of 60 hours, and be provided with overalls and hats.

-L.C.C. STRIKE.—On Friday last a general strike of L.C.C. tramway employés commenced, and has, at the time of writing, spread to the Metropolitan Electric Tramways in North London and adjoining areas. The men apparently want an immediate increase of 15 per cent. in wages; a re-arrangement of the working hours; and claim that their requests to enlist for the war, and be reinstated afterwards, have been refused. The Highwar, and be reinstated afterwards, have been refused. The Highways Committee points out that, under the Conciliation Board's scheme, the men agreed not to reopen the question of wages until June 26th next; that 79'81 per cent. of the men receive the maximum rate of 6s. 6d. a day, and only 12'28 per cent. receive as little as 5s. or 5s. 3d. a day, these men having been engaged to replace enlisted men, and receiving in addition a bonus. It is admitted that at four periods of the year the duties are spread over 14 or 15 hours a day, but the minimum spread-over is under 9 hours, and the average daily hours of work are 8 hours 24 minutes. About and the average daily hours of work are 8 hours 24 minutes. About 2,000 employés have enlisted, and the Committee states that as many as 500 have withdrawn applications to enlist which had ady been conceded.

LONDON ELECTRIC RAILWAY COMPANIES' FACILITIES BILL. The Parliamentary Committee of the L.C.C. recommends that, in the opinion of the Council, the proposals contained in the London Electric Railway Companies' Facilities Bill, 1915, should not become law unless accompanied by adequate safeguards for the interests of the Council and of the travelling public of London, and that a petition be presented against the Bill.

Newcastle.—Bonus Arbitration.—The award in con-Newcastle.—Bonus Arbitration.—The award in connection with the war bonus dispute on the Newcastle tramway system was made known last week. The Corporation had agreed to a bonus of 2s. 6d. per week to those earning less than 30s. a week; 1s. 6d. to those earning 30s. or more; and 1s. to youths up to 18 years old. The Tramways Committee as an alternative more agreeable to the men suggested 2s. 6d. a week to householders; 1s. 61, to single men without dependents; and 1s. to youths. The latter proposal, which was rejected by the Council, has been adopted in its entirety by the Arbitration Committee.

-FEMALE CONDUCTORS.--Arrangements have been made by the Paisley and District Tramways Co., for the employment of women car conductors, fully 100 of the male workers having left the service for the Army. Lady checkers have meantime been appointed.

Salford.—The Tramways Committee has agreed to refer the bonus question to arbitration. The first body of women conductors were expected to begin their training this week. The Committee has decided to reduce the facilities for half fares for children to those not above 12 years, instead of 14 years as formerly, and this is expected to give increased revenue to the extent of £4,000 per annum, given normal traffic.

- Traffic receipts Southampton,-YEAR'S WORKING. on the Corporation Transays for the year ended March 31st last show an increase of £369, as compared with the previous 12 months. The number of passengers carried shows an increase of 103,491; 159,691 more miles were run than in 1914 and the receipts per car-mile show a decrease of '930d. There has been an increase of 35,871 units in the current consumed, costing an additional £224.

South Staffordshire.--A meeting of drivers and conductors employed by the B.E.T. Co. in this area was held last week, when it was decided to ask for an increase of ½d. per hour in wages to cover the increased cost of living. Failing this being granted, it was also decided to cease work on Saturday. A resolution was likewise passed protesting against the employment of women in connection with the services.

- RAILWAY ELECTRIFICATION. -Venezuela. meeting in London last week of the La Guaira Harbour Corpora-, it was stated that the conversion to electric traction of the Macuto and Coast Line Rulway has been completed and had proved a great success.

# TELEGRAPH and TELEPHONE NOTES.

Illicit Wireless .- A resident of Malvern, Victoria, named W. A. Bleeck, has been charged with being in the unlawful possession of wireless apparatus; he was an employé of the Commonwealth postal department. A technical breach of the War Precautions Act was proved, and a small fine imposed.

New Atlantic Cable.—A statement has appeared in the German Press to the effect that a new cable is about to be laid between the Scandinavian States and the United States, which will not as heretofore pass ria Eugland. The preliminary work has been carried out, and the estimated cost will amount to 40,000,000 marks. Thanks to this new cable, says the journal, Germany will be able to telegraph to the United States without the necessity of making use of wireless, and, consequently, will be able to send secret messages.

Norway.-The number of telegrams transmitted during the year 1913-14 amounted to 3,870,000, or 73,000 more than during the period 1912-13. Telephone messages over long distances numbered 6,270,000, an increase of 688,000 as compared with the previous period. There are now nearly three messages per capita, which probably represents a record. The total revenue from the telegraph and telephone lines amounted to £738,200, as compared with the 1900-1904 to £738,200, as compared with the 1900-1904 to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared to £738,200, as compared t with £404,300, and the working expenses amounted to £319,000, as compared with £294,900 during 1912-13. The surplus was £12,000, as against £11,000 for the previous period. The total capital spent on telegraph and telephone lines amounted to nearly 2 million pounds sterling, and the sum added during the last period was about £207,000.

Pacific Cable.—Last week armed raiders made an attack upon the Pacific cable station at Bamfield Bay, on the west coast of Vancouver Island. Several men landed in a boat and made an attempt to cut the cable which connects Canada with Australia. The sentry on duty fired at them and turned the guard out; the guard rushed to the beach, but the men by that time had jumped into their launch, and were making off. Shots were fired after them. No damage was done to the cable.

South Africa.—The British forces under General Botha last week occupied Windhuk, the capital of German South-West Africa. The wireless station, a very powerful one, able to communicate with the stations in Togoland, and at Tabora, in German East Africa, was found practically intact.

Week-End Letter Telegrams.—The arrangement introduced on January 1st for sending week-end letter telegrams at approximately one-fourth of the charges for ordinary telegrams between soldiers sailors and nurses serving with His Majesty's Forces in the United Kingdom, France and Belgium and members of the general public in British possessions, has now been extended to the Forces serving in German South-West Africa. The special telegrams can be accepted for Lüderitzbucht at 9d. per word, and for Swakopmund at 10d. per work. The transmission thence to members of the Forces who may have advanced inland will be undertaken by the military authorities. undertaken by the military authorities.

Wireless on Board Ship.—The Board of Trade has decided to take the necessary steps to postpone the coming into operation of the Merchant Shipping (Convention) Act, 1914, until January 1st, 1916. By this Act all British ships carrying 50 or more persons, and also foreign ships entering British ports, are required to be provided with a wireless telegraph installation.

# CONTRACTS OPEN and CLOSED.

Australia.—Melbourne.—June 15th. City Council. Australia.—Melbourne.—June 15th. City Council.
Four mechanically-fired boilers, one turbine-driven boiler-feed
pump, two fuel economisers, circulating water pumps. City
Electrical Engineer. Specifications from Mesers. McIlwraith,
McEacharn & Co.. Ltd., London, E.C.
June 30th. Victorian Railway Commissioners. One 13-in.
centre lathe for turning or grinding commutators for traction
armatures; one 9-kw. motor-generator and battery-charging
accessories; four electric motors.

SYDNEY.—July 12th. Metropolitan Board of Water Supply and owerage. Two steam turbines and condensers at Ryde pumping ation, for the Chatswood pumping plant. Secretary, 341, Pitt Sewerage.

Sewerage. Two steam turbines and condensers at Ryde pumping station, for the Chatswood pumping plant. Secretary, 341, Pitt Street, Sydney.

July 19th. Council. Maximum-demand indicators. Specification (10e. 6d.) from Electric Light Department.

July 19th. Municipal Council. One or two 12,000-kw. turboalternators (Contract No. 363).* A copy of the specification can be obtained from the City Electrical Engineer, Sydney.

July 19th. Steel towers for 33,000-volt transmission line. Specification (10s. 6d.) at E.L. Department, Town Hall.

July 21st. N.S.W. Government Railways and Tramways Department. One 250-k.V.A. turbo-generator.*

ment. One 250-K.V.A. turbo-generator.

ADELAIDE, -June 30th.* - Deputy P.M.G. 120 miles of outside

distributing wire; 123 miles of insulated copper wire.

July 7th.*—27,000 jointing sleeves and 55,000 copper binders.

Specifications for the items marked * can be seen at the B. of T. Commercial Intelligence Branch in London.

Bury St. Edmunds.-May 27th. Corporation. Twelve months' supply of coal for the Electricity Department. Forms of tender from Mr. S. E. Day, Borough Electrical Engineer.

Chesterfield.—May 25th. Coal (about 8,000 tons of slack) for a year from September 1st, for the Corporation electricity works. Mr. R. L. Acland, Borough Electrical Engineer, Chatsworth Road.

Dublin,—May 25th. Corporation. Underfed stoker. See "Official Notices" May 14th.

Corporation Electricity Depart-Dundee.—June 4th. ment. Reinforced-concrete floored and jointless flooring, required for the extension to Carolina Port generating station.

Edinburgh.—June 21st. Two 5,000-kw. turbo-alternators and condensing plant, for Portobello supply station. See "Official Notices" to-day.

Finchley.—May 31st. U.D.C. Wiring, for light, 100 workmen's dwellings. See "Official Notices" May 7th.

Grangemouth.—The burgh invites tenders for supply of stores, including electric lamps. Mr. David A. Donald, Burgh

Leeds. — May 26th. Corporation. Steam, feed and water pipes. See "Official Notices" May 7th.

London. — L.C.C.—The Highways Committee recommends that tenders be invited from selected firms for the provision of switchgear in connection with the temporary supply of power for the working of the Council's tramways, and that the chairman and the vice-chairman of the Committee be severally authorized during the Whitsuntide recess to accept the most favourable,

June 4th. Installation, 260 wiring points, 345 lights, also electric bells, at the County Secondary School, South Hackney. See "Official Notices" to-day.

Manchester.—June 2nd. Corporation. Coal-unloading crane, conveying plants, &c. See "Official Notices" May 7th.

Middlesbrough.—5,000 tons of rough small steam coal, for the Cleveland and Durham Electric Power Co., Ltd. Particulars from the Secretary, Hinton's Buildings.

Portsmouth. — June 1st. Corporation. 100 tons of steel girder tram rails, five tons of steel flahplates, one ton of flahplates, three tons of 5-ft. wrought-iron tie-bars. See "Official Notices" May 14th.

May 26th. Electric lighting, &c., at Girls' Hostel, for the Education Committee. See "Official Notices" May 14th.

Rangoon.—August 11th. Installation of a system of fire-alarms, for the municipality. Specification (10a.) from Mesers, Ogilvy, Gillanders & Co., 67, Cornhill, E.C.

Sheffield.-May 28th. Two natural draught cooling towers complete. For the Electric Supply Department, See "Official Notices" May 7th.

Sub-station Tasmania.— Launceston.— July 26th. equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

Wigan. — May 29th. Corporation. H.T., three-core, paper and lead-covered, armoured feeder cable, transformer and switchgear. See "Official Notices" May 14th,

#### CLOSED.

Australia.—The Melbourne, Brunswick and Coburg Tramways Trust has accepted the tender of Messrs. Duncan and Fraser, of Adelaide, for 12 cars at £486 per car. Tenders let for the overhead equipment and material, sub-stations, trucks, wheels, axles and car equipment amount to over £53,000. The system is expected to be running early in 1916.

East Ham.—The tender of Messrs. Dick, Kerr & Co., Ltd., to re-equip one of the tramears with a 40-H.P. motor, new controllers, &c., for £275, has been recommended to the T.C. for

Edinburgh.—The Corporation E.L. Committee recommends the acceptance of the tender of the Stirling Boiler Co., Renfrew, at £32,000 in connection with the extension works at

Hendon.—The following tenders have been received by the Guardians for installing electric light at the institution :-

| Hendon Electric Supply Co. (including lamps and shades) (accepted) | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #850 | #

The tender of the Hendon Electric Supply Co., provided for a 10-H.P. motor, which was larger than required for the institution. The firm were, however, prepared to supply a 7½-H.P. motor and allow £4, and a further £6 discount on lamps, &c., which would reduce their tender to £340. The company's amended tender has been accepted,

liford.—The District Council has accepted the tender of Hford.—The District Council has accepted the tender of Rdison Accumulators, Ltd., at £1,240, for the supply of an electrical coal wagon of 4 tons' capacity, fitted with battery and automatic tipping gear. According to the report of the alectrical engineer, the tenders received included three makes of battery, viz., lead, lead (ironelad) and Edison. The lowest cost of carrying 12,000 tons of coal annually was quoted by the Cedes Electric Traction, Ltd., whose vehicle is fitted with a lead battery. The next lowest was that of the Edison Accumulators, which was only £6 above that of the Cedes Co. The engineer was of opinion that the best proposition was that of Edison Accumulators, Ltd., because, although the first cost was rather higher than some of the other quotations, the running cost was less, and at the end of 10 years, quotations, the running cost was less, and at the end of 10 years, when the capital had been wiped out, the vehicle should still be fit for several years' further service.

Ipswich.—The T.C. has accepted the tender of Messrs. Heenan & Froude for extensions to the refuse destructor plant. The total cost will be £5,200.

-The Metropolitan Asylums Board has accepted London.the tender of the London and Rugby Engineering Co., at £32, for the tender of the London and Rugoy Engineering Co., at \$32, for an electric motor for driving workshop tools at the North-Wester Hospital; also the tender of Mesers Lund Bros., & Co., at \$28, for accumulator-charging plant at the South-Eastern Station.

BERMONDSEX.—The Electricity Committee recommends the acceptance of the tender of Mesers. Babcock & Wilcox, Ltd., at \$1,330, for three chain grate stokers.

L.O.O.—The Education Committee recommends that the chairman, vice-chairman and deputy-chairman of the Council, the chairman and vice-chairman of the Education Committee, or the chairman and vice-chairman of the Education (Buildings Sub.) Committee may open during the Whitsuntide recess tenders for installing electric light in the County Secondary School, South

Maidstone.—For the E.L. installation at the Agricultural Hall the following tenders were received :-

W. Cogger	 • .	• •			(accepted)	£37
Drake & Fletcher	 				•• ••	89
W. T. Burrows		• •	• •	••		40
Haynes Bros	 •	• •	• •	••	••	\$6
Oswald Jones & Co.						49

Malvern.—The U.D.C. has accepted the tender of the Electrical Apparatus Co., Ltd., for a year's supply of meters

The Gas and Electricity Committee has accepted the following tenders for coal:—South Wales and C. C. Coal Co., Ltd., 2,500 tons; Mr. W. Edwards, 1,500 tons; Wilson, Carter & Pearson,

Meter Contracts.—Messrs. Chamberlain & Hookham, Ltd., have received the following contracts for the supply of meters for the coming year : --Battersea, Dundee and Swansea ; also from Southwark, for prepayment meters.

Mesers. Ferranti, Ltd., have recently obtained contracts for C.C.

meters for one year from the following electric supply authorities:—
Hornsey, Battersea, Pontypridd, Edinburgh, and Stockton-on-Tess.
Also from York Corporation for prepayment meters for a year.
The Southwark Borough Council has placed a contract for D C.
meters up to and including 25 amperes, and the Worthing Corporation has placed a renewal contract for the sole supply of 3-ampered.

meters during 12 months, with the Electrical Apparatus Co., Led.

The County Borough of East Ham has placed a contract with
the British Thomson Houston Co., Ltd., of Coventry, for twelve months' supply of their direct-current meters.

Pentypridd.—The U.D.C. has accepted the tender of Meesre. Siemens Bros. Dynamo Works, Ltd., for "Wotan" and tantalum lamps for twelve months.

Southend-on-Sea.—The following tenders have been recommended to the T.C. for acceptance:—

John Browns.—Five dozen steel tram tires, £30 per ton. F. Carrick & Sons.—Overhead travelling crane, £301.

Tottenham.—The District Council has been recommended to accept the tender of Mesers. Keene & Co., at £90 10s., for the supply of an electric motor.

# FORTHCOMING EVENTS.

Association of Supervising Electricians,—Tuesday, May 25th. At St. Bride's Institute, Bride Lane, E.C. Annual General Meeting.

Institution of Electrical Engineers.—Thursday, May 27th. At 8 p.m. At Victoria Embankment, W.C. Annual General Meeting.

Physical Society of London.—Friday, May 28th. At 8 p.m. At King's College, Strand. Papers on "Numerical Relations Between Electronic and Atomic Constants," by Dr. H. S. Allen; "A Method of Calculating the Absorption Coefficients of Homogeneous X-Radiation," by Mr. H. Moore; "Two Experiments Illustrating Novel Properties of the Electron Currents from Hot Metals," by Prof. O. W. Richardson, F.R.S.; "High Permeability in Iron," by Prof. E. Wilson,

Royal Institution of Great Britain,—Friday, May 28th. At 9 a.m. At Albamarle Street, W. Paper on "Engineering Problems of Mesopotamia and Euphrates Valley," by Sir J. Jackson.

#### NOTES.

Trans-Oceanic Telegraphy.—Some time ago it was announced in Germany, on good authority, that the German cable companies would by no means pass over the payment of dividends for the past year, notwithstanding the protracted interruption of traffic through British action. Apart from the fact that business had been in course of further development in the first seven months in 1914, the German cable companies are in enjoyment of Imperial subsidies which were fixed in such a manner as not only to afford security for the loans issued by them, but also to ensure a certain return to the ordinary shareby them, but also to ensure a certain return to the ordinary share-holders. At the same time it has to be borne in mind that the working expenses, particularly in regard to the cost of acquiring new business, have been reduced by the compulsory interruption of traffic. This statement has now been confirmed in one case, seeing that the German Atlantic Telegraph Co. proposes to pay a dividend of 6 per cent. as compared with 7½ per cent. in 1913.

A further matter of current interest relates to wireless telegraphy across the Atlantic. It will be recollected that in September of 1912 the High-Frequency Machine Co., of Berlin, concluded

ber of 1912 the High-Frequency Machine Co., of Berlin, concluded an agreement with an international undertaking—the Compagnie Universelle de Télégraphie et Téléphonie, of Paris—whereby the latter was to take over the stations built or then in course of construction by the former, at Ellysse, in Germany, and Tuckerton, New Jersey. The explanation of the proposed transfer lies in the fact that the Germans assumed at the time that their aims would be more likely to obtain recognition, especially in the United States, through an international than through a purely German enterprise. At any rate, the German company was to receive, partly in cash and partly in shares, the sum of £100,000 from the Paris company for the use of the Goldschmidt high-frequency machine patents outside of Germany, and £80,000 for the station at Tuckerton, but it is uncertain how much was to be paid for the Eilvess station, if it was really intended that this should be transferred to the control of the international company—a control which would probably have been merely a nominal one from the Teutonic point of view. But the occurrence of war naturally brought about a change in relationship. When hostilities first trok place the transmission of wireless messages between the Tackerton station—which had been established prior to the Germans scouring a licence or concession from the Government of the United States—and the Elivese station had passed beyond the experimental stage, and an application was then submitted to the American authorities asking for a concession.

experimental stage, and an application was then submitted to the American authorities asking for a concession.

The agreement between the two companies had not been completed on the outbreak of the war, but the Paris company is now seeking to secure its fulfilment in the United States, through precedings which have been instituted in the courte at New Jersey, although the Tuckerton station, which has been placed under the training of the states. The distribution of the control of the United States Government for the durat war, would be of no use unless a corresponding station were created in France. The German company contents the competency of the New Jersey courts, contending that the plaintiff petency of the New Jersey courts, contending that the plaintiff company must preced before the German courts. It is also submitted, according to a New York correspondent of a German newspaper, that excitens for differences in regard to property between subjects of nations now engaged in war cannot hold good, and that if the American courts settled them they would represent a breach of neutrality. If, however, the Paris company were placed in possession of the Tockerton station, the Eilvese station would not remain in communication with it, and thus the service to Germany, which is now maintained only through the American control, would be, it is held, seriously, injused. It is specially by means of this station; apart from the station of lesser nower at Sayville; that communication is maintained with Germany, which would otherwise be entirely out off from the United States. On the other hand, it is urged that the surrender of the Tuckerton station to the Paris company would also have the of the Tuckerton station to the Paris company would also have the or the Tuckeron station to the Paris company would also have the result of rendering matters inconvenient for the American Government. The correspondent concludes, therefore, that even if the New Jersey courts should decide in favour of the plaintiff company it is probably out of the question that the latter would gain possession of the station, and that there are so many legal measures available against such a judgment that the war would have to last a very long time before these resources were exhausted.

Denmark,—A firm of engineers in Odense desires to Benmark,—A nrm or engineers in Odense desires to secure the representation of United Kingdom manufacturers of electrical goods, including transformers, insulators (especially H.T.), insulating materials (fibre, &c.), watertight fittings, tumbler and ironclad switches, ammeters and voltmeters. Apply to the Commercial Intelligence Branch of the Board of Trade, London, E.O., for the name and address,

Patents and Alien Enemies,—Application has been made to the Board of Trade by Messra. Gilbert Gilkes & Co., Ltd., to avoid or suspend Patent No. 22.565/12, granted to Honold, for runners for Francis turbines. The Board has granted a licence to Messra. W. T. Henley's Telegraph Works Co., Ltd., in respect of Patent No. 5,198/08, granted to Miele.

The King at Parsons's Turbine Works.—In the course of his visit on Wednesday to Tyneside engineering and ship-building works, his Majesty the King was conducted through Messrs. Parsons's turbine works by Sir Chas. Parsons.

Market Quotations .- The British Aluminium Co. quote the following prices for aluminium:—Ingots, £95 per ton; wire £125 per ton; sheet, £125 per ton.

The British Association.—At the annual meeting, which, as already announced, takes place at Manchester, from Tuesday, September 7th, to Saturday, September 11th, Prof. A. Schuster will deliver the presidential address in the Free Trade Hall, and the evening discourses will also be delivered there. A conversazione will be held on Wednesday evening, September 8th, in the Manchester Institute of Technology. It is hoped that visits may be paid to some of the principal works, mills and warehouses of Manchester and Salford. The reception room will be in the Whitworth Hall of the University. The sectional meetings will take place in the buildings of the University or its immediate neighbourhood. neighbourhood.

Section A.—Mathematical and Physical Science.—Chairman, Sir F. W. Dyson, F.R.S.

Section B.—Chemistry.—Chairman, Prof. H. B. Baker, F.B.S. Section G.-Engineering.-Chairman, Dr. H. S. Hele-Shaw,

Sheffield Electrical Social Union.—On Monday even-SHEMICIA ELECTRICAL SOCIAL URIOH.—Un Monday evening, the 17th inst, the members of this Union held a successful gathering at Stevenson's Restaurant, Castle Street, Sheffield. Tea was served at 6.30, and was followed by a thoroughly enjoyable Smoking Concert. Well encored songs were given by Messrs. Farrant, Giles, Burdett, Robinson, Chatfield, Royce and Hemmington, whilst Mr. Clarke gave banjo solos. Mr. Lumb was in the chair.

Canada.—A Vancouver firm desires to be placed in communication with United Kingdom manufacturers of dry batteries and bulbs for flashlights, torches, &c., torch cases, flashlight cases, and nitrogen-filled half-watt lamps. An agent in Montreal, who has had considerable experience in the purchasing of hardware and electrical fixtures and general tramway sup-plies, desires to secure the agencies of United Kingdom manu-facturers of these goods. Applications should first be addressed to the C.I. Branch of the Board of Trade in London.

Fires Due to Air Raids.—The British Fire Prevention Fires Due to Air Raids.—The British Fire Prevention Committee, which is always on the alert for an opportunity to carry on its beneficent work, has issued a circular (memorandum No. 18) pointing out that the fire brigades will necessarily devote their attention first to protecting Government offices and military stores and works, so that the owners of private property should organise measures for their own protection. Suggestions are therefore given as to the proper steps to be taken in anticipation of raids by air-oraft, and technical advice in special cases is offered free of charge. Inquiries should be addressed to the Gen. Hon. Secretary, Mr. Ellis Marsland, 8, Waterloo Place, Pall Mall, S.W.

British Industries Fair.—According to all reports the British Industries Fair, held at Islington, has been an unquelified success. A dinner was to be held on Wednesday night at the Hotel Cecil, Lord Southwark, President of the London Chamber of Commerce, presiding, and with Mr. Runciman, President of the Board of Trade, as principal guest, for the purpose of marking exhibitors' appreciation of the services of the Board of Trade. The exhibitors' appreciation of the services of the Board of Trade. The Times, in referring to the large amount of business that has been done as the result of new industrial enterprises embarked upon since the outbreak of war, says:—"In the glass and pottery sections orders amounting to some £40,000 have been placed for glass bulbs for electric lamps, in which Germany has hitherto held a lead." There seems to be a strong desire for the Government to organise the Fair annually, and there can be little doubt that, as we suggested last week, if such a course be adopted, quite a big event of very far-reaching importance, requiring much larger premises, may be expected.

I.C.C. Employés.—It was reported at Tuesday's meeting of the L.C.C. that a petition had been received from some of the light and power attendants employed in the rolling-stock section of the tramway department asking that their rate of pay (8d. an hour) be increased by 1½d. an hour; that light and power attendants who had done wiremen's work in the past, and were now engaged on electrical work, might be regarded as traction wiremen for depôt work only; and that an opportunity might be given for such traction wiremen to be promoted to the grade of general wiremen as vacancies occurred. As the Highways Committee was not prepared to recommend the Council to accorde to these requests, the men asked that their application be referred to the appropriate conciliation board, and it is proposed that this course be agreed to.

Thefts of Electric Lamps.—At the Central Criminal Court, before the Recorder, Alfred Sears, 43, traveller, was convicted of stealing electric lamps from the office of Mr. Farloe, 50, Gresham Street. It was stated that the prisoner had made a practice of visiting various offices and, representing that he had authority to inspect electric lamps, had availed himself of the opportunity of substituting old lamps for new ones, which he took away and sold. He was detected by the housekeeper at 50, Gresham Street and given into custody. He said, on arrest, "Do forgive me, I have a wife and family." Detective Dyer, City police, proved that accused had been twice previously convicted of stealing electric lamps, and there were numerous complaints of losses from City offices. Prisoner was sentenced to 12 months' hard labour. Thefts of Electric Lamps.—At the Central Criminal

Inquiry.—Makers of Reflex carbons for kinematograph purposes are asked for,

Institution and Lecture Notes.—Electrical Association of Australia.—In his address as president of the Victorian Section, on March 31st, Mr. W. H. Alabaster detailed the progress that had been made in the use of electricity in Melbourne during the past 10 years, and indicated the possibilities for future advances. In 1914 the Melbourne undertakings had an output of 36 million units; he anticipated that in five years this would be increased to 100 millions, in addition to 129 millions for the suburban railways, making a total of 229 million units for Melbourne and the suburbs, Mr. Alabaster also discussed the use of electricity for cooking, which he had practised for a long period in his home; he considered that some system of hire-purchase was necessary to induce consumers to install the apparatus.

Junior Institution of Engineers.—Mr. C. H. Woodfield, speaking recently on the subject of cranes, said that in the comparison of steam or hydraulic cranes with electric cranes, there was not a single feature in favour of the former two as regarded cost of installation, durability, economy in working and upkeep, or facility of control. Au important feature in favour of the electric crane was the ever-ready reserve power up to 100 per cent. momentarily and 50 per cent. for a longer period than was required for crane work. As regarded upkeep, the wear and tear of electric motors was not half as much as for the steam crane.

Society of Engineers (Incorporated).—On the 11th inst-MR. A. H. BARKER, Wh.So., read a paper on "Heating and Ventila-tion." He said that the legitimate function of the engineer was to MR. A. H. BARKER, Wh.So., read a paper on "Heating and Ventition." He said that the legitimate function of the engineer was to produce and control specified movements of air and other effects, while it should be the duty of the physiologist and hygienist to specify what were healthy and comfortable conditions. In comnection with heating, the expression "temperature of a room was generally understood to mean the reading of a thermometer suspended in the room, but this reading did not necessarily indicate the temperature of the surrounding air, or form a reliable guide to the feelings of the occupants of the room. The air temperature, the radiant temperature, the quantity of convected heat and the quantity of radiant heat must all be determined, but first the relation between the thermometer reading, the air temperature and the radiant temperature must be determined. The freshness of air in a building depended on keeping the air temperature relatively low and the radiant temperature high. The chemical composition of the air had, within wide limits, no effect on the human organism, whereas the temperature and humidity were very important. The paper described experiments made at University College and the apparatus used in connection with them, and discussed briefly some problems which it was sought to solve experimentally. experimentally.

Electric Lift Fatality.—At an inquest at Manchester recently, touching the death of Harold Vincent Burgess (27), who received fatal injuries through being pinned in the well of a lift for 40 minutes, it was stated that he pushed a truck into the cage of the lift and in endeavouring to reach over to press the lever he slipped. The lift was set in motion and, his legs hanging beyond the floor of the cage, he was trapped between the wall and the cage on the second floor. A verdict of "Accidental death" was returned, and the Coroner, commenting on the fact that he had conducted a similar inquiry a day or two before, said it seemed to conducted a similar inquiry a day or two before, said it seemed to him that there should be some protection for the starting handles

Educational.—University of Bristol.—In order to provide additional residential accommodation for students, the University has recently rented houses which will form a temporary college for men students, and will be ready for use in a few weeks.

German Business Methods.—At the Sales Managers' Association in London last night, Mr. J. H. Vickery, LL.B., a Canadian, who for fourteen years practised International Law in Berlin, delivered an address on "German Business Methods as seem by a Canadian Resident in Berlin."

Appointments Vacant. — Junior assistant electrical engineers, over 19 (15s.), for Newcastle-on-Tyne Electric Electrical Co.; junior engineer (temporarily), for Walsall Mains and Sales Departments (£2); charge engineer (38s.), for duration of war, for Wakefield Corporation. Particulars are given in our advertisement pages.

Copper.—The gradual increase in price of standard copper does not, so far, appear to have stimulated production in any marked degree. Messrs. H. R. Merton & Co.'s tabulated statistics for May 15th show an increase in European visible supplies of 1,065 tons for the fortnight, and an increase in English supplies of 2,915 tons. In detailed supplies, European arrivals from North America are low as compared with the pre-war average. Supplies from Spain and Portugal to England and France are well up, and from Spain and Portugal to England and France are well up, and considerably above the pre-war average, and those from unclassified "other countries" are also high. Chile shipments show the nusually low figure of 842 tons for the fortnight, which may be due to the large quantity received last month from this source. Australian shipments are maintained at the same figure as for the last three months, which is still about a quarter less than the prewar average, though better than the earlier months of the war. Total deliveries are low compared with those for March, but promise to considerably exceed April deliveries. In view of unusual consumption it is remarkable that the price does not more rapidly increase, and that visible supplies increase at all.

(Continued on page 733.)

# ELECTRICITY SUPPLY AT KARACHI, INDIA.

KARACHI, the most westerly of the four great ports of commerce in the Indian Empire, has, during recent years, been growing in importance at a phenomenal rate, and it is

not impossible that it will loom largely in the map of the world that is now being remade, as the Government have intimated that it will be the Indian terminus of the proposed great Trans-Persian Trunk Railway connecting Europe with India through Moscow and Baku, and surveys of the first part of the route from Karachi have already been made.

It is the chief outlet for the products of the Punjaub (wheat, oilseed, cotton, &c.), and has considerable commerce with Afghanistan and Baluchistan.

The total trade of the port has increased by lears and bounds, and in 1912 it reached the phenomenal figure of £40,725,000, while in 1914, despite the war, it was still £34,000,000.

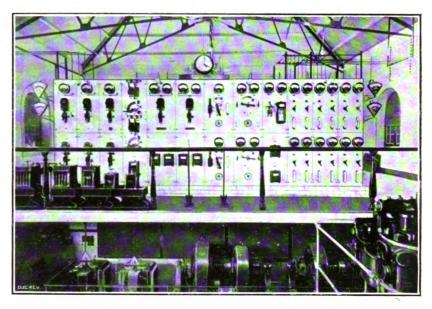

The population between the census of 1901 and that of 1911 jumped from 115,402 to 159,270—an increase of 38 per cent.

The commerce of the port overshadows everything else, but there naturally follow in its wake industries established there that pertain to commerce, among which are extensive

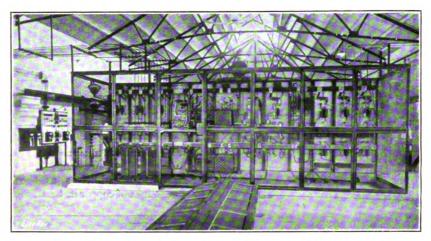

local flour mills, ironworks, printing presses, soda water factories, &c., with land and facilities all ready for the considerable increase in their number that is sure to result from the general trend of events and the importance of the district.

Some years ago the Port Authority installed their own electrical undertaking, but up to a month or two ago there was no public supply of electrical liminary steps to introduce a scheme for the supply of electrical energy, and this has now been achieved.

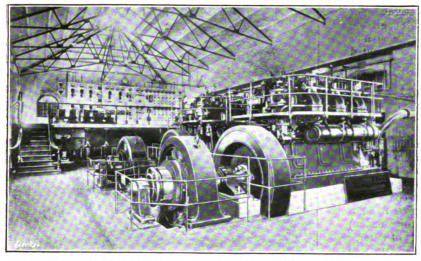

It will be observed that Karachi is one of various

MAIN SWITCHBOARD, KARACHI ELECTRICITY STATION.

VIEW BEHIND SWITCHBOARD, SHOWING COVER OF BAITERY REGULATING SWITCHES.

INTERIOR OF ENGINE ROOM, SHOWING DIESEL-ELECTRIC PLANT.

energy or of gas. A few years ago, however, the Hon. Mr. M. de P. Webb, C.I.E., of the well-known firm of Messrs. Forbes, Forbes, Campbell and Co., Ltd., took the pre-

prosperous communities in the East which have preferred to rely on electricity rather than on gas for their development and well-being.

Messrs. Crompton and Co, Ltd., the well-known electrical contractors, came on the scene at an early stage, and with their assistance, the Hon. Mr. M. de P. Webb investigated the prospects of a public electric supply undertaking, as a

result of which Messrs. Forbes, Forbes, Campbell & Co., Ltd., decided to apply, under the Indian Electricity Act of 1910, for a Government Licence to supply electrical energy in Karachi.

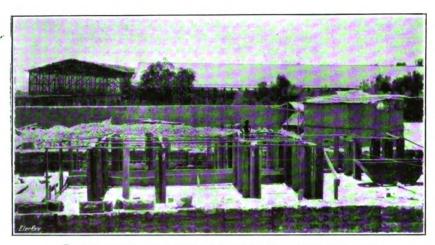

This was granted in due course, and in 1912 the licensees retained Messrs. Handcock & Dykes, of Westminster, as their consulting engineers.

After some negotiations a very suitable site was selected in the Elander Road, with ample space for extensions, and with access to the railway.

As a result of full consideration it was decided to install a direct-current Diesel-driven plant, with a three-wire system of distribution throughout the district, and early in 1913 the Karachi Electric Supply Corporation, Ltd., was brought into existence, for the purpose of taking over the rights conveyed by the licence and of putting them into effect. A con-

and of putting them into effect. A contract for the complete equipment of the power house and distributors was entered into with Messrs. Crompton, and shortly after that a start was made on the foundations.

These in themselves were a matter of considerable magnitude in proportion to the works, as, owing to the nature

PUTTING IN FOUNDATIONS OF STATION BUILDINGS, KARACHI,

of the soil, it was necessary to excavate to some considerable depth, the work being also impeded by tidal waters and land

floods. All difficulties of this nature were gradually overcome, and a substantial armouredconcrete bed put in position to receive the machinery.

The outbreak of the war caused considerable delay in the works, as the licensees, from patriotic motives, decided to transfer part of the staff to the wiring of troopships, while at a somewhat later stage the consulting engineers' representative, and also

some of the contractors' representatives on the spot, joined His Majesty's Forces. The work originally was to have been completed by the end of 1914, and, despite delays and other difficulties due to current events, on February 1st, 1915, the completed station was formally opened by the Commissioner in Sind, R. P. Barrow, Esq., I.C.S., in the presence of a large gathering of the principal inhabitants.

In an important city like Karachi it was necessary to give very careful consideration to the relative merits of overhead and underground distribution, and the engineers ultimately decided in favour of the former. The area of supply is roughly triangular, with the station situated centrally in a three mile base line.

The first section of the generating plant, as at present installed, consists of two 240 B H.P. and one 100-B.H.P. Diesel engines, supplied by Messrs. Mirrlees, Bickerton and Day, and direct-coupled to Crompton 440-580-volt dynamos.

The cooling of the circulating water was a problem calling for careful consideration, and the engineers finally decided on using Messrs. Heenan & Froude's coolers, two of which have been provided, either being capable of dealing with the circulating water required at full load. The coolers are fixed in a cooler house opening out of the engine room, a 10,000-gallon water storage tank (fed from the town mains) being fixed above to provide the necessary storage of water.

The main switchboard, consisting of 14 white marble panels, including three generator, two battery, two booster, two balancer, one summation, one earth and three feeder panels, complete with moving-coil measuring instruments and switchgear, is mounted above the battery room, being thus raised some 7 ft. above the engine room floor.

The battery consists of 276 Tudor cells, having a capacity of 653 ampere-hours at the 10 hours' discharge rate.

The pressure of supply is 220 volts on either side of a three-wire system (440 volts across the outers), but at full load the station voltage will rise to about 512 volts, to compensate for the drop in the feeders.

This necessitates battery regulating switches having a large number of contacts; these switches are of the horizontal pattern, and are fixed in the floor above the battery room, behind the main switchboard, being operated by levers similar to railway signal levers, fixed in front of the board.

There are two automatic balancers, each capable of dealing with an out-of-balance current of 75 amperes, and three motordriven boosters, each capable of a continuous output of 150 amperes at 0-115 volts.

It was thought wise to start, in the

first place, with direct current, as tending in the earlier stages to bring the undertaking more quickly to a remunerative stage; but it is not impossible

that as the area and the scope of the operations are extended, a mixed system will be adopted to meet the probably large demand for energy for power purposes that is sure to grow

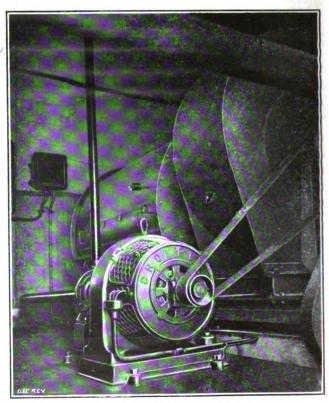

up.
The whole of the in the strength of

overhead work has been carried out in strict accordance with the regulations of the Indian Government, and is most substantial throughout, with a considerable margin

WHERE EAST MEETS WEST: NATIVE GROUP OUTSIDE THE GENERATING STATION.

the poles for additions as the undertaking develops. The weight of copper installed with the first section is 35 tons.

HEENAN COOLER AT GENERATING STATION.

A considerable number of consumers have already been connected, and the licensees have made a rangements by which all consumers who so wish, may have their wiring

work carried out at a most reasonable price and in a first-class manner, under their

supervision.

Messrs. Crompton & Co.'s contract has been carried out under the supervision of their representative, Mr. T. F. Raven; the consulting engineers' representative during the earlier stages was Mr. F. N. Menzies, until he joined His Majesty's Forces, and Mr. H. Frazer Nash, his successor, has now become the resident engineer.

Considerable extensions of the works are already in hand, due to a very important contract entered into with the Municipality for public lighting, which, in the first instance, will embrace some 500 lamps.

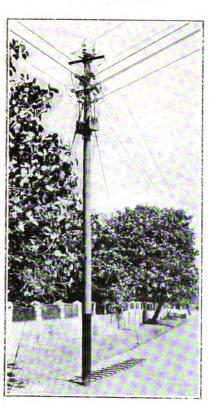

Not the least interesting circumstance in connection with the undertaking is the fact that of the nine directors, seven are Indian gentlemen, who have given influential support to the project.

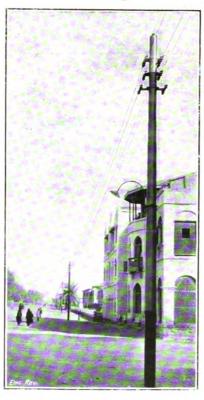

# THE WOOD GREEN ELECTRICITY UNDERTAKING.

THE supply of electrical energy in Wood Green, which commenced last Christmas, is being given by the Tottenham District Light, Heat & Power Co.—formerly known as the Tottenham and Edmonton Gas Light

and Coke Co .- to whom the statutory powers were trans-

The area of supply under the order embraces the whole of the urban district, comprising 1,625 acres with a population of 50,000 inhabitants.

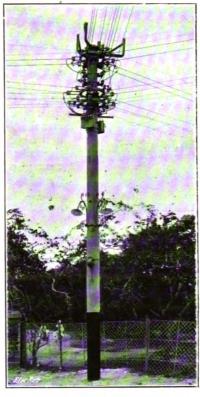

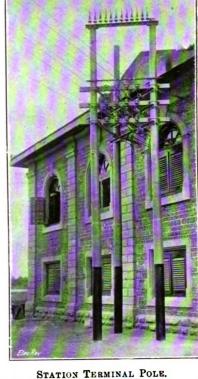

NK POLE. POLE LINE, SHOWING LIGHTING BRACKET, OVERHEAD DISTRIBUTION, KARACHI (see page 729).

The generating station is situated in Ringslade Road at the rear of the company's local offices and in close proximity to the depôt of the Metropolitan Tramways.

Town gas supplied from the Tottenham works of the company is delivered through a 12-in. main into a holder on the site, which has a diameter of 40 ft., and performs the dual rôle of providing gas storage and maintaining it at the required pressure at the engine valves. A special meter

FEEDER POLE: 36 WIRES. OVERHEAD DISTRIBUTION, KARACHI (see page 729).

of 20,000 cb. ft. per hour capacity has been provided to measure the gas used.

The generating station is a steel and brick structure with three bays, the centre one forming the engine house; the ground floor of one of the side bays provides accommodation

for the switchboard and electrical control gear, and for a fitters' workshop, above which the battery room has been constructed. Water-cooling plant and silencers occupy the other bay, the water-softening plant, storage tank, offices and stores being situated on the upper floor.

Two sets of generating plant have already been erected, one of 100 kw. and the other of 200 kw. capacity, and space is available for two additional sets of still larger capacity, as the demand develops. There is also a battery of 200-kw. capacity on a one hour discharge.

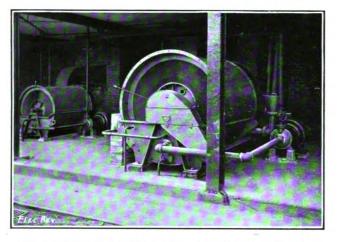

The gas engines are the modern highspeed vertical type, built by Messrs. Hindley and Sons, one of 170 and the other of 340 B.H.P., running at 450 B.P.M. and 350 R.P.M. respectively. Both have five cylinders, and are equipped with forced automatic lubricating arrangements and double magneto ignition.

By means of the multiple cylinders and high speed of rotation, the working parts of the engine are kept comparatively small. As the principal working parts are enclosed and lubricated under pressure, the wear and tear are reduced to a minimum. The engines can be started up and put on full load in less than a minute. There is no noticeable vibration—specially designed foundations having been provided to ensure this—and
the silencing of the exhaust has been
made almost ideally perfect, the multiple
cylinders and high speed being a distinct aid to this

attainment.

Compressed air is used for starting the engines, and is taken from a battery of four receivers, which are charged by a motor-driven air compressor.

The circulating water for the engine cooling is supplied by gravity from a tank of 1,600 gallons capacity, situated

HEENAN COOLERS AT WOOD GREEN GENERATING STATION.

on the first floor over the cooling plant. By means of interlocking gear between the compressed air valves and the

valves, the starting up of the engines without turning on first the water is rendered impossible. The water flows into two Heenan rotary water coolers, capable of dealing with 4,000 and 2,000 gallons of water per hour respectively, and is returned to the storage tanks by means of electrically driven centrifugal pumps. All the water used is first treated by a Boby watersoftening plant of 300 gallons capacity.

The engines are directly coupled to tandem directcurrent dynamos of the Electric Construction Co.'s make,

these being multipolar shunt-wound machines fitted with interpoles. The armatures of each set have been made strictly interchangeable, even to the provision of a coupling outside the outboard bearing. The machines are designed to generate current at any voltage from 250 to 280.

The battery, which was supplied by the Chloride Electrical Storage Co., consists of 270 Plantide cells. The whole of the regulating cells range along one side of the toom, and the copper rod connections are carried on insulators on the wall to the centre, where they are carried down through insulating tubes in the floor to the regulating switches which are imme-

diately below.

For charging the battery there is a double-ended E.C.C. booster in the engine room; the two boosting dynamos each

have a capacity of 10 kw., and are driven by a 58-B.H.P. 500-volt motor, running at a speed of 1,200 R.P.M., the starting panel being fixed close at hand.

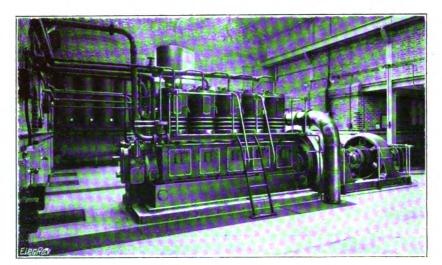

The switchboard, which also came from the Electric Construction Co., consists of two generator, one battery and booster, one integrating watt-hour meter, and three feeder panels, all of black enamelled slate.

The panels are divided horizontally at the centre by an enamelled slate shield, the top half being devoted entirely to the positive side of the system and the lower half to the negative. All the circuits are protected by automatic cutouts, and, where suitable, time lag attachments are provided. The whole of the instruments are of the Cirscale type manufactured by the Record Electrical Co. The regulating gear has been kept entirely separate from the board; the resistances are placed in a cellar into which all the cable connections from the generators and boosters come and also the feeder cables. Immediately above the resistances, the control pillars, eight in number, including two for the battery regulating switches, are mounted on the engine room floor. An earth panel with an Everett Edgcumbe disk recording ammeter, short-circuiting relay and overload breaker, is fixed on the wall at the back of the board.

A 10-ton Morris hand-operated travelling crane has been

installed in the engine room.

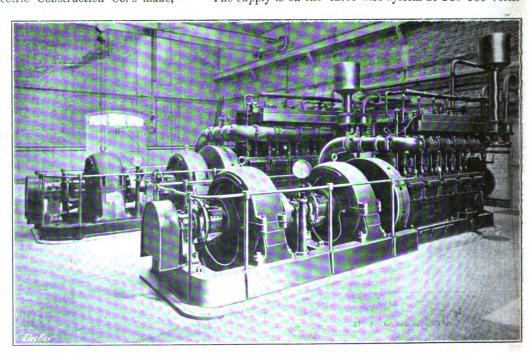

Under the contract the consumption of gas by the generating sets working at ordinary full load, with gas of 500 net B.TH.U. per cb. ft. at a normal temperature and barometric pressure, is guaranteed not to exceed, for the 200-kw. set, 30.75 cb. ft., and for the 100-KW. set, 31.35 cb. ft. per unit generated, as registered by watt-hour meters; trials of the plant give warrant

HINDLEY HIGH SPEED GAS ENGINES OPERATING ON TOWN GAS.

to the view that the guaranteed results will be excelled.

The supply is on the three-wire system at 240-480 volts.

WOOD GREEN GENERATING STATION: HINDLEY-E.C.C. GAS-ELECTRIC SETS.

Under the Wood Green Electric Lighting Order the streets scheduled for the compulsory mains were limited to High

Road and Myddleton Road, but the company has inaugurated the supply with a comprehensive system of distributing mains throughout the principal streets of the district.

All the cables are of the three-core type, paper-insulated, lead-covered and steel armoured, and were supplied by the Western Electric Co. There are three feeding centres where the feeder mains serve the distributors, one situated near the Town Hall, one in the High Road adjacent to Noel Park Station, and the other in the Alexandra Park district; at these centres feeder pillars have been erected, and similar pillars in other situations provide an easy means for dividing up the network of distributing mains into suitable sections. All the pillars, service boxes and consumers' fuse-boxes have been made by Messrs. Lucy & Co., while the service and station meters are of the Chamberlain & Hookham type.

The capital expenditure on the scheme, including Parliamentary costs, land, generating station and mains, amounts

to about £30,000.

Responsibility for the preparation of the scheme is shared by Mr. A. E. Broadberry, manager of the Tottenham District Light, Heat and Power Co., and Messrs. May and Hawes, consulting engineers. The duties of directing and supervising the constructional operations have been performed by Mr. J. Fisher, assistant manager of the company, and Mr. L. W. Ballard, chief assistant to the consulting engineers, supervised the constructional work, &c.

#### NOTES.

(Continued from page 728.)

Gas Engine Tests.—In a paper read before the Insti-TUTION OF MECHANICAL ENGINEERS On Friday last by Prof. A. H. Gibson and Mr. W. J. Walker, of University College, Dundee, tests on an experimental gas engine made by the National Gas Engine C. Ltd., are described. Town gas was used, having a lower calo-

rific value of 520 B.TH.U. per cb. ft.

It was found that the mechanical efficiency of the engine, which had a maximum output of 36 B H.P. at 250 R.P.M., increased with increasing load, the highest value recorded with the richest mixture and at the lowest speed (150 B.P.M.) being 88 per cent. At the normal speed (200 B.P.M.) has the efficiency 85 per cent. The mechanical efficiency diminished as the ratio air : gas increased from 7: 1 to 11: 1, and diminished as the speed increased; it was independent of the ratio of compression.

The thermal efficiency, referred to the BH.P., increased with the load, and attained a maximum with an air: gas ratio of 8:1; it diminished as the speed increased, and increased with the com-

pression ratio.

Special provision was made for separating and measuring the exhaust losses, which, at full load, lay between the limits 33'6 per cent. and 42'5 per cent. The former value corresponded to a weak mixture, high compression and low speed, and the latter to a rich mixture, low compression ratio and high speed.

Electric Vehicle Committee.—At the last meeting of this Committee held on May 11th, Mr. A. E. Collins, the city engineer of Norwich, took his seat as the representative of the Institution of Municipal and County Engineers; Mr. A. de Turckheim took his seat as representative, pro. tem., of the Tramways and Light Bailways Association, and Mr. G. F. Heath, of Heath's Garage, Ltd., as the representative of garage interests.

The Committee considered and passed the draft for the Committee's annual report and accounts, to be incorporated in the annual report of the I.M.E.A., and the Secretary submitted the draft of the report to be submitted for discussion at the annual meeting of the I.M.E.A. on June 17th, entitled "The Uses of the Electric Vehicle in Municipal Service."

The arrangements were discussed for the proposed parade of electric vehicles on June 17th, and the time was provisionally fixed for 5 p.m. If permission is obtained the parade will be held on the Embankment. this Committee held on May 11th, Mr. A. E. Collins, the city engineer

on the Embankment.

As the result of the circular letter sent to electric supply undertakings, a number of them have purchased publicity material; the Secretary, however, reported that he had received several letters which indicated apathy on the part of some undertakings in regard to the electric vehicle business.

The Technical Sub-Committee have now completed the preparation of the vecent upon "Methods (Charming and Charming and Charmi

tion of the report upon "Methods of Charging and Charging Equipments," which is to be circulated to members of Committee. The Committee has decided to sek the Accumulator Section of the Committee has decided to ask the Accumulator Section of the B.E.A.M.A. to consider the desirability of bringing about standardisation in regard to (1):—The clearance for the accumulation of sludge between the lower edge of the plates and the bottom of the cell container; (2) the size of the filler plug-hole and a design of plug for same; (3) the distance between the top of the lip of the plug hale and the top edges of the plates, so that one gauge may always be used in a garage for fixing the proper level of the electrolyte, measuring from the top edge of the filler hole lip; and (4) details of connectors between cells and method of connecting these to the plate terminals. plate terminals,

Lead Scarcity in Russia.—The scarcity of lead in Russia is one of the problems of the national electrical industry. Deposits of lead ore having been discovered in the district of Murman, it is announced that a furnace has been erected for smelting the ore in the Ulsen factory, Archangel. The lessees of the deposits are Stephanovitch and Ostrem.

Petrograd Electric Station: Oil Fuel Difficulties.-The introduction of petroleum as fuel at the Petrograd electric tramway power station has led to some irregularities in the supply of current. On May 5th a damaged valve in the tank whence the boilers received their supply resulted in these remaining without fuel. The petroleum had to be fed in by other means; but the result was a reduced supply of electricity and a temporary stoppage of the tramway service. Such is likely to recur at times till all the boilers are equipped for burning liquid fuel. Meantime fresh supplies of coal (the scarcity of which was the cause of the conversion of the boiler furnaces for liquid fuel) are being received. conversion of the boiler furnaces for liquid fuel) are being received.

#### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTBICAL REVIEW posted as to their movements.

Central Station Officials.—The Aylesbury U.D.C. has re-appointed MB. W. A. TUBNBULL as resident engineer at the electricity works, on the same terms as his previous engagement.

He has acted as clerk of works during the erection of the station.

Mr. H. WOOLGAR, fourth engineer at the Falham B.C. electricity works, has been temporarily appointed to the position of engineer, at a salary of £3 per week, during the absence of MR. A. ABDERN on military service, and MR. L. FLOAT, junior engineer, has been appointed fourth engineer, at a salary of £2 2s. per

MR. C. HANDLEY, shift engineer at the Scottish Central Electric Power Co.'s generating station, Bonnybridge, Falkirk, has resigned his position in order to take up the duties of shift engineer at the Corporation electricity works, Motherwell.

General.—With reference to the notice that appeared in our last issue respecting MR. HARRY W. NIMMO'S movements, we learn by this week's mail that the Government of Burmah has, on his being relieved of the duties of Electrical Inspector, Advantage of the purpose of getting out detailed estimates of a proposed electricity supply scheme.

MR. HOWARD EADY, district telephone manager at Jersey for the Exeter area. Prior

15 years, has been appointed manager for the Exeter area. Prior to going to Jersey in 1900 he was at Bournemouth.

PROF. S. P. THOMPSON, F.R.S., delivered the Swarthmore Lecture at the Central Hall, Westminster, on Tuesday last, taking as his subject "The Quest for Truth."

COUNCILLOR JACKSON has been elected chairman of the Swinton

COUNCILLOR JACKSON has been elected chairman of the Swinton and Pendlebury Electricity Committee.

MR. C. C. T. EASTGATE has been appointed Electrical Inspector to the Government of the Punjab, Lahore. MR. J. H. CARDEW, electrical engineer, North-Western Railway, Lahore, has resigned the Government service, and MR. D. A. PETRUSE, foreman electrician, has been placed in charge of the office of electrical engineer of that railway.—Indian Engineering.

MR. J. SCRIVENER has resigned his position as director and manager of Mesers. Krupka & Jacoby, Ltd., having been appointed to control the sales organisation of the "Z" Electric Lamp Manufacturing Co., Ltd., Southfields, S.W. Mr. Scrivener's late codirectors have given him a gold watch as a mark of their personal esteem, and the staff have presented him with a suit case.

csteem, and the staff have presented him with a suit case.

MR. WALTER F. BRADSHAW has been appointed manager of Reuter's Telegram Co., Ltd., in place of the late Baron de Reuter.

SIE EDGAR SPEYER, consequent upon "charges of disloyalty and suggestions of treachery" that have been made against him in the Press and elsewhere, has asked Mr. Acquith to accept his resignation as a Privy Councillor and to revoke his baronetey. He has also resigned his seat on the board of the Underground Electric Railways Co. of London, Ltd., and Lord George Hamilton, the deputy-chairman, has been appointed chairman in his stead. deputy-chairman, has been appointed chairman in his stead.

Obituary.—Mr. G. Maurice.—There is, unhappily, no room for doubt that Mr. G. Maurice, of the General Electric Co., Ltd., must be numbered amongst the victims of the Lusitania disaster. A correspondent, who was in intimate touch with him, sends us the following personal appreciation:—"As one who was in close companionehip with him for 18 years, I feel that some note of appreciation may be welcomed by his many friends in the electrical world. Many qualities go to the making of a man if his success is to be assured. Mr. Maurice most surely exhibited in his business career the possession of all those qualities that may be considered essential ones. Insight to direct him what to do, foresight to tell him how to attain, courage to enable him to overcome— Obituary.—Mr. G. MAURICE.—There is, unhappily, no sight to tell him how to attain, courage to enable him to overcomethese three virtues were his chief characteristics, and the successful application of them to his daily life may be said to be the foundation on which his career was built. His was a full life; a life largely devoted to the business to which he was attached, and with which his interests were bound up. His career was a singularly successful one; whatever came under his control prospered. His capacity for work was enormous, his ability insured success, his handling of large affairs was conducted with

cool judgment and skill, and a firm belief in the righteousness of his action invariably carried him through, no matter how flerce the opposition against him. No man can go through life without meeting opposition in the course of his business career, and Mr. Maurice had many opportunities of crossing swords in the pursuit of his aims; but he was a good fighter who invariably earned the respect of his opponents. In estimating his personal expression as or his aims; but he was a good lighter who invariably earned the respect of his opponents. In estimating his personal expression as revealed to those who came in contact with him, I think the word "respect" most closely expresses the influence he exerted over others, over the staff, his competitors, in fact over all with whom he had business relations. The many warm expressions of regret received from business men all over the world show in how much respect he was held, and how deeply his loss is deplored. It is doubly sad since the many years of faithful, strenuous, and hard endeavour had but recently won him a seat on the Board of the G.E.C., in which position his characteristic ability would have found still greater fields in which to operate. Mr. Maurice leaves a wife and one child, a daughter." We may add our own personal appreciation of the late Mr. Maurice, as the result of editorial relations with him extending over many years, perhaps more particularly in connection with matters concerning the G.E.C. electric light fittings department, and latterly the heating and cooking department. There are few men in the electrical industry with whom it has been so genuine a pleasure to converse as with him; his was the perfection of courtesy—a quality which editors, who not infrequently come across something totally different, know how to value when they meet it.

meet it.

Mr. H. F. FRIEDERICHS.—At the funeral of the late Mr.

Friederichs, Corporation electrical engineer at West Hartlepool,
there were indications of the affection and esteem in which he was there were indications of the affection and esteem in which he was held. Among the chief mourners were Mr. J. E. Dawson, chief assistant, Mr. C. W. Thompson (electrical engineer, Saltburn), the Mayor and many members of the Corporation, Mr. J. J. Smith (electrical engineer, Stockton), and the staff of the West Hartle-pool electricity department. The body was borne to its last resting place in Stranton Cemetery by some of the oldest workmen. Among the wreaths was one from Sir John Snell, and one from the workmen and staff of the electricity works bore the inscription: "A tribute to our noble and unselfish master." A member of the staff, in writing to us, desorbes Mr. Friederichs as "one of Nature's "A tribute to our noble and unselfish master." A member of the staff, in writing to us, desorbes Mr. Friederichs as "one of Nature's gentlemen," and makes mention of his genial, kind and unassuming manner, which secured for him the passionate attachment and devotion of the whole of his staff.

MR. BRODRICK CLOETE, a director of Mesers, Vickers, Ltd., was

among those lost in the Lusitania.

# NEW COMPANY REGISTERED.

Simplex Sleeper Syndicate, Ltd. (140,294).—This company was registered on May 11th, with a capital of £3,450 in 2,850 pref. shares of £1 each and 12,000 ord, shares of 1s, each, to take over certain patents or rights for an invention relating to railway or tramway sleepers and the electrical installation of track rails, to adopt an agreement with U. P. Sandberg, O. F. A. Sandberg, and N. P. P. Sandberg, to carry on the business of manufacturers, installers, and users of, agents for and dealers in railway or tramway sleepers and devices for the electrical installation of track rails and similar appliances, and mechanical and engineering devices for use upon railways and tramways, etc. The subscribers (with one pref. share each) are: T. Jowett, 33, Savoy Court, Strand, W.C., civil engineer; P. Wheeler, Central Buildings, Westminster, S.W., civil engineer: Private company. The number of directors is not to be less than three or more than eight; the first are C. P. Sandberg (chairman). O. F. A. Sandberg, N. P. P. Sandberg, A. Spencer, T. Jowett, and P. Wheeler. Qualification, £5. Remuneration, £50 each per annum. Registered office: Palace Chambers, Bridge Street, Westminster.

# OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Pernambuco Tramways and Power Co., Ltd.—Issue on ord 20th, 1915, of £25,000 debentures, part of a series of which particulars April 20th, 1915, of £25 have already been filed.

Phænix Electric Heating Co. (1914), Ltd.—Mortgage on moneys payable under certain Admiralty contracts, dated May 10th, 1915, to secure all moneys due or to become due from the company to Parr's Bank, Ltd., 126, High Holborn, W.C., not exceeding £200.

Torquay Tramways Co., Ltd.—A memorandum of satisfaction to the extent of £800 on May 7th, 1915, of charge dated March 8th, 1911, securing £60,000, has been filed.

Barbados Electric Supply Corporation, Ltd.—Issue on March 3rd, 1915, of £500 debentures, part of a series of which particulars have already been filed.

Stella Conduit Co., Ltd.—Mortgage on land and premises, known as Highfield Works, Ash Street, Bilston, Staffs., dated April 19th, 1915, to secure all moneys due or to become due from the company to Lloyds Bank, Ltd., Temple Row Franch, not exceeding £2,100.

Harrow Electric Light and Power Co., Ltd. (44,529).— Capital Z50,000 in 6.667 ord, and 3.333 pref. shares of Z5 each. Return dated March 11th, 1915. All shares taken up; Z50,000 paid. Mortgages and charges, Z26,325.

Isle of Wight Electric Light and Power Co., Ltd. (53,823).

—Capital £150,000 in 20,000 ord, and 10,000 prof. shares of £5 each. Return dated April 9th, 1915. All shares taken up; £150,000 paid. Mortgages and charges, £92,355. (Originally registered in 1907 as the Ventnor Electric Light and Power Co., Ltd. Re-named in 1900.)

Oswestry Electric Lighting and Power Co., Ltd.—Issue on March 2nd, 1915, of £300 debentures, part of a series of which particulars have already been filed.

Newtons, Ltd.—Particulars of £10,000 debentures, created March 23rd, 1915, filed pursuant to Section \$3 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £500 (renewals). Property charged: The company's property, present and future. No trustees.

Novelty Construction Co., Ltd.—A memorandum of satisfaction to the extent of £265 on April 12th, 1915, of debentures dated Nay 31st, 1912, securing £915, has been filed.

Carville Site and Power Co., Ltd.—Issue on April 28th, 1915, of £10,000 debentures, part of a series of which particulars have already been filed.

#### CITY NOTES.

#### Shanghai Electric Construction Co., Ltd.

THE directors report for 1914 a profit of £33,602, compared with £34,726 for 1913. There has been transferred to reserve with £34,726 for 1913. There has been transferred to reserve for renewals account £10,000, and in reduction of the preliminary expenses account £1,000; a dividend of 6 per cant. for the year (less income tax) absorbs £19,200, leaving to be carried forward £4,703.

The loss by exchange on subsidiary coinage in 1914 was £28,038, which is equal to 8½ per cent, on the capital of the company. Profits have been converted into sterling at an average rate of 1s. 9½d, to the Mexican dollar, as against 2s. for the preceding year. During the year the increased depreciation of subsidiary coinage, and the fall in the exchange of silver into sterling, con.bined to affect profits adversely to the extent of over £7,000 as compared with the company's experience in these respects in 1913. For the first half of the year the number of passengers, and the amount of gross receipts and operating profit, showed a satisfactory expansion, which was to a large extent neutralized during the remainder of the year by the less favourable conditions folk wing upon the outbreak of war. Thirteen new motor cars and 15 new trailer cars were completed during the year, and a further 10 new motor cars have been completed since the close of the year.

Railless traction was introduced with seven cars in Fokien Road in November last with satisfactory results as regards receipts, but was suspended in consequence of the road bed being found unsuitable. Fokien Road is accordingly to be reconstructed in concrete, to the initial cost of which the company will make a moderate contribution. Traffic conditions will be materially improved by the reconstruction, and the Municipal Council will reduce the charge to the company for road maintenance. The directors announce with great regret the death of their colleague, General Albert Theys.

regret the death of their colleague, General Albert Thys.

#### Kalgoorlie Electric Power and Lighting Corporation, Ltd.

THE directors in their report show that the drop in the profit The directors in their report show that the drop in the profit for the year 1913 was due to exceptional causes; the result for 1914 is well up to the average of previous years. The dividend on the preference shares has been maintained at 4 per cent., and a debenture redemption fund has been inaugurated by the allocation of £7,000 for this purpose. The sum of £6,500 has been written off to depreciation for the year, leaving, after payment of the debenture interest, £846 on profit and loss account to be carried forward. The money set aside in previous years as a "reserve for depreciation and renewals" having been expended, has, with the approval of the auditors, been written off. The war has not interfered with the company's operations and did not add much to its operating costs during the past year. During the current year operating costs during the past year. During the current year the company will be affected by increased taxation demands both in Australia and this country. Its operating costs will also be somewhat increased as nearly every item of stores and supplies is costing, and is likely to cost, a higher figure.

Annual meeting: May 25th.

#### Anglo-American Telegraph Co., Ltd.

MR. F. A. BEVAN (Chairman) presided on Friday, at Winchester House, E.C., over the annual meeting. He said that they had during the year received the rent payable under the lease with the Western Union Co., which sufficed to pay the dividends on the three classes of stock. As they were aware, the deferred dividend was payable at the end of each year, and the proportion of the quarterly rental that represented such deferred dividend was accordingly retained and invested on the best terms that the directors could secure. As a result. and the proportion of the quarterly reflat that represented such deferred dividend was accordingly retained and invested on the best terms that the directors could secure. As a result, £1,308 was received in respect of interest on bank balances and loans, which with the amount previously earned produced £5,625. That sum, subject to the requirements of the company from time to time, the directors were advised was available for distribution amongst the deferred stock holders and the ordinary stock holders. It had been suggested that the directors should make an immediate distribution of this sum, but they had come to the conclusion that the amount was too small, looking to the large number of deferred stock holders and to the very small sum that would consequently pass to them. They thought it would be advisable to wait until they were able to distribute, say, ½ per cent, upon the deferred stock, including, of course, the ordinary stock holders' interest in that stock, which would absorb £8,750, towards which, as he had said, they had £5,625 in hand. In the renewal fund

Vol. 76. No. 1,956, MAY 21, 1915.]

account it would be seen that they had received the annual contribution of £20,000 from the Western Union Telegraph Co., as stipulated in the lease, and £2,487 as interest and dividends on investments, which with the amount brought forward from the previous year gave a total of £153,099. Out of that they had had to pay the cost of new cable inserted during the repair and renewal of the cables, ameunting to £44,933, and they had also paid £43,800 on account of the new cable repair ship. In respect of that, there was a further liability of approximately £37,000 to be paid before the ship came into their possession. They had for several years been considering plans for a new cable ship to replace the old one, which was in such a condition that it was imperative that it should be replaced. Accordingly, under the agreement with the Western Union Co., they entered into a contract for a new ship, the total cost of which would at the outside be £81,000. In ordinary circumstances the ship would by now have been completed, but, owing to the war, private contracts had to stand aside for Government work; but they hoped to get tand aside for Government work; but they hoped to get delivery of the ship before the autumn. They were fortunate in having concluded the contract before the war, or the price would have been increased 30 or 35 per cent. In order to make the payment for the new cable and ship, it was necessary to realise investments, and this resulted in a loss on the say make the payment for the new cable and ship, it was necessary to realise investments, and this resulted in a loss on the sale of £3,632. Whilst this was a matter to be regretted it was, of course, one they were powerless to prevent, and when one considered the heavy depreciation in all classes of securities they would agree they could congratulate themselves that the loss was limited to the small sum stated. As to the renewal fund, it could only be a matter of time when the balance would be eliminated from the accounts. At the moment the balance was £60,625, of which £41,867 represented the cost of investments. Since the date of the balance sheet the majority of the securities had been sold to make further payments on account of the new ship, and he need scarcely say that they had been sold at a substantial decrease on the cost price. The securities which had not been sold were for the time being practically unsaleable, and if disposed of in these times there was very little hope of their getting back the money paid for them. The £65,000 was based on the cost of investments, and required to be depreciated accordingly. What it would amount to no one could say; but at the present moment they might them. The £65,000 was based on the cost of investments, and required to be depreciated accordingly. What it would amount to no one could say; but at the present moment they might assume that they had an actual balance on the renewal fund of £55,000, of which £37,000 was required to complete the payment for the new ship, leaving approximately £18,000 to the credit of the fund. An arrangement had been come to with the Western Union Co. whereby the directors had agreed that so long as any balance remained upon the renewal fund the cost of new cable inserted in the course of repairs to the companies' cables should be paid for out of the fund. What the cost of cable so inserted in the current year would be he could not say. Last year it amounted to £44,000, and as the 1873 cable was interrupted now in deep water, he feared it might be necessary to insert a long length of new cable, and if this be so, then the cost of that new cable would absorb not only the £18,000 which remained in the renewals fund, but also the annual contribution of £20,000 to the fund payable by the Western Union Co. at the end of the year. If these amounts were insufficient to pay for the new cable, then, of course, it would devolve upon the Western Union Co. this year to find the balance, and in all future years to bear itself the whole cost of the repair and renewal of the companies' cables. The Chairman next dealt with the pension fund, and said that the report of the actuary showed that a contribution of £6,970 was required from the Western Union Co. In conclusion, he was pleased to say they remained on the friendliest terms with their lessees, who paid their rent with commendable promptitude.

Mr. B. H. Bryson seconded the motion with commendable promptitude.

Mr. R. H. Benson seconded the motion.

The report was adopted.

Replying to a vote of thanks to the board and staff, the CHAIBMAN said that next year he would complete 50 years as a director of the company.

#### Lisbon Electric Tramways, Ltd.

The annual meeting was held on May 12th, at the offices, 1, London Wall Buildings, E.C., Mr. Ludwig Breitmeyer presiding. The Chairman, after referring with regret to the death of the late Secretary, Mr. S. W. Jameson, said that during the last five months of the year a period of exceptional trouble came unexpectedly upon them, and although they escaped direct interference from the war, owing to the locality of their undertaking in a neutral country, they felt the reflex action by the increased cost of fuel and other supplies, and, further, by the great fall in the Portuguese exchange, which dropped from 46d. to about 36d. All those adverse factors, which were quite beyond their control, brought about a decrease in the profit of about £20,000. The traffic returns showed steady records from year to year, and were an evidence that the business was on a sound and healthy basis. Unfortunately, in the current year the unsatisfactory conditions to which he had referred still prevailed, and until the war was brought to a conclusion they must expect to suffer under the higher costs of operation and the depreciation in the international exchange. It had not been possible out of the year's profits to make the usual appropriation of £35,000 to depreciation reserve. Only £15,000 had

been set aside from this source, but in order to bring the amount to approximately the figure of £35,000, the sum of £19,012 formerly standing to the premium on ordinary share capital had been utilised for the purpose. In addition, as in former years, they had placed £5,000 to exchange reserve account, bringing it up to £55,000. The shareholders would now see that the policy of creating this reserve was a wise one and was justified by events, and the precaution of providing ample reserves in the past now enabled them to maintain the present dividends. Capital expenditure to the extent of £51,000 had been incurred during the past year, which should add to the revenue-producing power of the company. Two of the most important of the Ascensores lines were now open to traffic, and the conversion of the remaining three inclines of this system to electricity was nearing completion. The extension of the power house plant was finished, and were it not for the high prices obtaining for fuel, a great saving in this connection over previous years would have resulted. The price of coal before the war was from 22s. 6d. to 25s. per ton; now it ranged between 37s. 6d. and 40s.; their annual consumption was between 19,000 and 20,000 tons. He regretted to say that the negotiations with the Lisbon Municipality regarding the interpretation of some clauses in the concession had made no further progress. A new Council had recently been nominated by the Government, and they hoped that their endeavours in the future for effecting an equitable settlement would be met in a more reasonable and conciliatory spirit. On the whole, he thought they could hoped that their endeavours in the future for effecting an equitable settlement would be met in a more reasonable and conciliatory spirit. On the whole, he thought they could congratulate themselves on the outcome of the past year's working, for, although the net result was not so favourable as formerly, the actual business of the company was as good as ever, and the reduction of the profits from £129,000 in 1913 to £110,000 last year was only due to temporary causes brought about by the present European upheaval, and which they hoped would pass away with brighter days. From present indications he did not think he was too optimistic in anticipating a further increase in the revenue during the current year. Of course, no accurate forecast was possible—all depended on the duration of the war; and he sincerely hoped that before they met next year a permanent and beneficial peace would have been obtained.

Mr. J. R. Taylor seconded the motion, which was adopted.

Mr. J. B. TAYLOR seconded the motion, which was adopted. Subsequently, on the motion of Sir Lionel Phillips, a resolution was passed voting 100 guineas to the Red Cross Society.

### West India and Panama Telegraph Co., Ltd.

MR. W. B. KINGSFORD presided at Winchester House, E.C., on May 12th, over the annual meeting. He first referred in feeling terms to the loss sustained by the company by the death of Sir J. Cameron Lamb. The vacancy had been filled by the election of Sir A. F. KING, K.C.B. The revenue was more than that for the corresponding period, and although the expenditure was somewhat heavy yet the ratio of expense to income was slightly less than in the December period of 1913. The half-year's working showed a net profit of £18,633, an increase of £5,614. Some part of the increased expenditure was of a permanent nature. There were certain items, however, which were directly due to the exceptional conditions that had prevailed during the last five months of the half-year under review, and they hoped that when peace returned they would be able to effect economies on these items. Ever since the outbreak of war they had been obliged to carry on their business under such varied and unusual conditions that it was almost impossible for him even approximately to fore-MR. W. B. KINGSFORD presided at Winchester House, E.C., their business under such varied and unusual conditions that it was almost impossible for him even approximately to forecast the future. The strict, but necessary, censorship which since last August had been in force at most of their stations, and the partial prohibition of the use of codes throughout the West Indies, had very much hampered business, and had so greatly disturbed their normal working conditions as to cause the directors some anxiety as to the probable future effect upon their earnings and upon the profits of the company. He might remind them that these were already adversely affected by the reduction in the rates which came into force on October might remind them that these were already adversely affected by the reduction in the rates which came into force on October 1st. These greatly reduced rates had, no doubt, been a great boon to the telegraphing public. Thus far, however, he regretted to say that the growth in the volume of traffic gave little reason to hope that the lower rates would be compen-sated for by new business, at any rate, while the restrictions already referred to continued to be in force. He told them at the last meeting that since the war they had been required, and they were still required, to keep their stations open day and night thus costing them very much extra expenditure and they were still required, to keep their stations open day and night, thus costing them very much extra expenditure and subjecting their operating staff to very severe strain. Their clerks had worked admirably throughout this very trying emergency, and they felt that great praise was due to them for their loyal and willing service. As regarded their investments, in respect of the reserve fund as at December 31st last the war made it quite impossible for them in some cases to obtain reliable quotations. As stated in the report, the depreciation amounted to £15,000. It was unlikely, however, that they would need to sell securities, and therefore it might be reasonably hoped that with the return of normal conditions that depreciation would be reduced.

Mr. H. W. BIRKS seconded the motion.

Mr. H. W. BIRKS seconded the motion.

The report was adopted, and a vote of thanks passed to the board and staff.

# Great Northern Telegraph Co., Ltd., of Denmark.

THE receipts for 1914 amounted to £792,038, and the expenditure was £250,590, leaving a net profit of £541,447. proposed to put to reserve and renewal fund £111,111, to pension fund of staff £11,111, directors' remuneration £2,500, dividend and bonus 22 per cent. £330,000, carrying forward £86,725.

The annual meeting was held at Copenhagen on May 8th. Rear-Admiral F. C. C. BARDENFLETH, D.R.N., rendered an account of the working of the company during the year 1914 on behalf of the Chairman (Commodore E. Suenson, D.R.N.), who was prevented by illness from being present. that the terrible war, which had not only set aflame the most important countries in Europe, but had also spread the conflagration to the Far East and to almost every other part of the globe, had compelled all the governments, belligerent as well as neutral, to adopt certain measures for the exercise of control over the telegraphic and postal services. result of these measures this company's accounts with other administrations had been much delayed, and for this reason the directors had been obliged to postpone the general meet-The strict neutrality observed during the war by the Danish Government, as well as by the Governments of Sweden and Norway, had made it the plain duty of the company to follow similar principles in its dealings with the administrations of the several countries in which the company's cables were landed. They had always, however, in times of peace as well, followed these principles of neutrality and discretion, and had thereby gained the absolute confidence of the governments concerned in the perfectly impartial and loyal service ments concerned in the perfectly impartial and loyal service of the company. This confidence had not been withdrawn during the war. In 1914 fifteen interruptions had occurred to ten cables in Europe, whilst, in the Far East, six cables had suffered 28 interruptions. The company's cables in the Baltic, between Denmark and Russia, became interrupted towards the end of November last year, and, unfortunately, owing to the war, it had not yet been possible to repair them. In Europe the cable steamer H. C. Orsted had been occupied for 105 days, of which 32 days were for the account of other administrations; in the Far East the cable steamers Store Nordiske and Pacific had been occupied for 188 days, of which 41 and 6 respectively were for the account of others. The Vladivostock and Kiachta routes had worked very satisfac-Vladivostock and Kiachta routes had worked very satisfactorily and carried a considerable part of the traffic exchanged between Europe and the Far East; but the said traffic via the company's lines had sensibly decreased since the war broke out. The line in Mongolia between Kiachta and Peking had been overhauled during the year; a constant supervision was, however, required to keep the line in efficient working order. The Japanese Government cable between Shanghai and Nagadalia to the actablishment of which this generative and the setablishment of which this generative and the setablishment of which this generative and the setablishment of which this generative setablishment of the setabli The Japanese Government cable between Shanghai and Nagasaki, to the establishment of which this company consented during the negotiations mentioned in the reports of the last two general meetings, was opened for traffic on January 1st, 1915, after the Japanese Government had secured the necessary consent of the Chinese Government. The cable, according to existing arrangements, is only to be used for the transmission of telegrams written in Japanese Kana characters and for Government, telegrams, exchanged, terminally, between Shanghai and Japan. In the spring of last year a convention was concluded between the Russian and Japanese Governments regarding the junction, at Sakhalien and at the frontier of Chosen, of the telegraphic systems of the two Governments. The rates for telegrams exchanged terminally via these new conventions between the support of the properties of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of the support of t connections between Russia and Japan had been fixed at very low figures and in such a manner as to preclude the company's low figures and in such a manner as to preclude the company's Vladivostock-Nagasaki cables from competing for the said traffic at equal rates. The traffic of which they were thus deprived, and which they had vainly tried to retain for their route by a heavy reduction of their rates, was not inconsiderable; in other respects the convention did not affect the company's rates or traffic. The negotiations with the Chinese Government were rather protracted, and it was only in the month of August last year that a final settlement was arrived at. The arrangements thus concluded mainly secured for the company the Chinese Government's approval of, and cooperacompany the Chinese Government's approval of, and co-opera-tion in, the arrangements entered into with Japan in 1913. The traffic over the company's cables had been extremely heavy during the war and continued so, especially in Europe. At the outbreak of the war all the direct connections between the telegraph systems of the United Kingdom, France and Russia on the one side and those of Germany and Austria-Hungary on the other side were naturally broken off. The burden of all the telegraphic correspondence between Russia and her allies was cast upon the company's system, whilst other classes of traffic also increased considerably over and above the normal, the average number of words contained in the telegrams being increased, owing particularly to the universal prohibition of the use of code. In these circumstances a very heavy task devolved upon the company's staff. The death of Colonel E. V. Tychsen, a director, occurred last December. Mr. W. Weimann had been asked to take his place. From the 1st July, Mr. F. C. C. Nielsen, after about 45 years' active

service in the company, had, owing to failing health, tendered his resignation as the company's representative in England, a position which he had filled with conspicuous ability for over 24 years. Mr. Nielsen had consented to be retained in a conposition which he had filled with conspicuous ability for over 24 years. Mr. Nielsen had consented to be retained in a consulting capacity and thus give the company the benefit of his great experience and intimate knowledge of its affairs in England. Although the financial results of the year 1914 had been eminently satisfactory, the increase of the receipts, being due to the war, was a temporary one only. "This fatal war, through which the company prospers for the time being, may still entail grave consequences; for nobody is able to foresee whether the fortunes of the war way not to morrow present whether the fortunes of the war may not to-morrow prevent us from pursuing our peaceful work, nor is it possible to fore-tell whether the results of the war in Europe and in the Far tell whether the results of the war in Europe and in the Far East will allow us to continue the working of the cables under the same conditions as those which prevailed before the peace was broken." Notwithstanding that the company may at any moment be placed in a difficult position, the board of directors is glad that the unexpected increase of the receipts warrants the distribution of a total dividend and bonus for the year of \$22 per cent. At the same time, the board proposes, as an exceptional measure, to add a further \$55,556 to the reserve and renewal fund, a proposal which is justified by the continued depreciation of the investments, amounting to about \$188,000, during the years 1912, 1913, and 1914.

# Electric Construction Co., Ltd.

Electric Construction Co., Ltd.

The directors report that for the year 1914 the net profit, after providing £6,800 for debenture interest and £5,000 for depreciation, is £35,567, plus £7,153 brought forward, making £42,721 available. After paying 7 per cent. on the preference shares for the year ended March 31st, 1915, a dividend at the rate of 6 per cent. per annum on the ordinary shares is recommended requiring £13,452, transferring to general reserve fund £17,403, and leaving £7,471 to be carried forward. "The directors are pleased to be able to report a good general demand for electrical machinery, which has been enhanced by special orders arising out of the declaration of war. The extension of the company's works, reported last year, has enabled these orders to be executed promptly and economically. The volume of unexecuted orders is satisfactory. The directors report with regret the death of their colleague, Mr. William Bulloch. Mr. David Willock, who has been in the service of the company for 18 years, has been elected to fill the vacancy on the board. As indicated at last general meeting, the directors have, by the transfer of a sum from general reserve, reduced the amount in 'shares in other companies' to what is considered the realisable value. The amount remaining at the credit of general reserve, after making the contribution recommended from last year's profits, will be £36,000."

Annual meeting: May 27th.

Annual meeting: May 27th.

### West African Telegraph Co., Ltd.

PRESIDING on May 12th at the annual meeting, held at Electra House, E.C., Sir J. Denison Pender, K.C.M.G., said that the gross receipts for the year amounted to £55,500, an increase of £9,600. That improvement in the receipts was mainly due gross receipts for the year amounted to £55,500, an increase of £9,600. That improvement in the receipts was mainly due to the naval and military operations on the coast which were taking place in connection with the war. The sum received in the year under review for messages was £42,600, as compared with £34,600, or an increase on message account of £8,000. The amount received as interest and dividends on the reserve fund investments was practically the same as in the preceding year. The total expenses were £26,100, against £29,600 in 1913, thus showing a decrease of about £3,500, energy owing to a smaller expenditure on cable repairs. The amount expended on cable maintenance varied considerably from year to year, and, as he had repeatedly pointed out, the expenses formed no criterion as to what the cost was likely to be. In 1913 they spent under that head £12,000; this past year only £7,000; yet the same care and foresight had been exercised in each case. The general expenses in London for the past year were £2,735, against £2,718, while the working expenses at stations were £11,490, as compared with £11,678. The only item which called for remark was £434, which represented the contributions made by the company to various war relief funds—an expenditure which he was sure would meet with their entire approval. The net result of the year's working was that, while maintaining the usual dividend of 4 per cent., they had been able to carry the very respectable sum of £19,000 to the general reserve fund, which now stood at the nominal figure of £315,000. It must, however, be borne in mind that the securities representing that fund had depreciated in value, although, owing to the however, be borne in mind that the securities representing that fund had depreciated in value, although, owing to the present restriction in Stock Exchange operations, it was difficult to tell to what extent depreciation had actually taken place. Fortunately for them there was no necessity at this time to realise any part of the reserve fund, and the interest they received from it, which formed part of their revenue, was in no way disturbed.

Sir HENRY C. MANCE seconded the motion, and the report was adopted.

## German Electrical Companies.

The Ver. Isolatoren Werke A.G., of Pankow, reports a declining period of prosperity in 1914. The provision made for depreciation amounts to £2,800, as compared with £5,900 in 1913, leaving net profits of £590, as against £6,600. It is not possible to pay any dividend, this result comparing with per cent. in the preceding year. It is stated that owing to army orders the new financial year has started favourably.

The Hamburg Hochbahn A.G. records the transport of 36,478,190 passengers in 1914, as compared with 39,000,969 in 1913, and receipts amounting to £250,000, as against £263,000. After defraying working expenses of £140,000, as contrasted with £139,000, and deducting the necessary payments to the State and making provision for reserve fund, the accounts indicate net profits of £33,000, as against £47,000 in 1913. The directors recommend a dividend of 4 per cent., as compared with 5½ per cent. in the preceding year.

with 5½ per cent, in the preceding year.

The Deutsche Kabelwerke A.G., of Berlin-Lichtenberg, states that the company was well employed during 1914, and realised slightly greater profits than in the preceding year.

After allocating £14,000 to depreciation, as against £16,000 in 1913, the net profits are returned at £41,000, as compared with £34,000. It is proposed to pay a dividend of 6 per cent., as contrasted with 8 per cent., to devote £11,000 to the writing down of the machinery to the value of one shilling, and place £3,700 to a war reserve fund, and £4,000 to the special reserve fund, leaving £1,700 to be carried forward, as against £3,400 in 1913.

The report of the C. Lorenz A.G., of Berlin, shows, after writing off £22,000 for ordinary depreciation and £5,000 off a Russian investment in Petrograd, net profits of £80,000 in 1914 on a share capital of £70,000. It is proposed to pay a dividend of 25 per cent., as compared with 20 per cent. in 1913, and a bonus of 7½ per cent., as against 6 per cent., out of the net profits, which include those derived from the business connection with the High Frequency Machine Co. It is now intended to increase the ordinary capital to £150,000 by the issue of new shares at a premium, for the purpose of strengthening the company's financial resources.

The Elektrizitats Lieferungs Gesellschaft, of Berlin, which owns 21 electricity supply works and holds a lease of several others, reports that the development of business was satisfactory until the war, when a contraction took place; but shortly afterwards a favourable course was resumed by most of the works. The scarcity of petroleum which occurred exercised a stimulus on the supply of the electric light and brought many additional customers to the company, whose custom was doubtless permanently assured by the recognition that oil lighting could no longer compete with electric lighting with economical lamps. It was of advantage to the company that, with the exception of the works at Craiova, Rumania, all the undertakings were situated in Germany. The accounts indicate gross profits of £287,000, as against £310,000 in 1913, and net profits amounting to £179,000, as compared with £213,000. It is proposed to pay a dividend of 10 per cent. on ordinary share capital of £1,500,000, as contrasted with 12 per cent. in 1913, the loan capital totalling £1.450,000.

The Deutsch-Sudamerikanische Telegraphen Gesellschaft, of Cologne, reports net profits amounting to £52,000 for 1914, as compared with £56,000 in the previous year. It is proposed to distribute 6 per cent. as against 6½ per cent in 1913, and to place £2,600 to the legal reserve fund, £7,500 to the contingency fund, and £2,500 to the benevolent fund, being the same sums respectively as in 1913.

The balance sheet of the Heddernheimer Kupferwerk und Suddeutsche Kabelwerke, of Frankfort-on-Main, after apportioning £18,000 to ordinary depreciation in 1914, as against £20,000 in 1913, shows net profits of £66,000, as compared with £57,000. It is intended to set aside £16,000 for reserve funds and extra depreciation, as in 1913, and to pay a dividend of 7 per cent. as in the previous year, leaving £11,000 to be carried forward.

The Felten und Guilleaume Carlswerk A.G., of Cologne-Mulheim, reports net profits of £300,000 for 1914, as contrasted with £321,000 in 1913. The former total has been arrived at after a careful valuation of the credit held abroad and the allocation of £25,000 to special depreciation of machinery and apparatus. A dividend of 8 per cent, is in contemplation, as in the previous year, and the sum of £30,000 is to be assigned to the disposition fund for works, as in 1913.

The Bernmann Elektricitate Werks, 4 G. of Berlin, 1903.

Is to be assigned to the disposition fund for works, as in 1913. The Bergmann Elektrizitats Werke A.G., of Berlin, record gross profits amounting to £555,000 for 1914, as compared with £579,000 in the preceding year. General expenses, interest charges, taxes, etc., absorb £215,000, as against £257,000, and depreciation requires £158,000, as contrasted with £135,000 in 1913. The balance permits the payment of 5 per cent., as in the previous twelve months, the appropriation of £50,000 for a war reserve fund, and the carrying forward of £17,000, as compared with £16,000 in 1913.

The report for 1914 of the Kabelwerk Wilhelminenhot of

The report for 1914 of the Kabelwerk Wilhelminenhof, of Berlin, states that the working results did not remain uninfluenced through the outbreak of the war. Nevertheless, the company could again submit satisfactory accounts, and as it did not appear necessary further to strengthen the reserve fund it was possible to recommend the same rate of dividend as in the preceding year. Including the balance brought for-

ward, and after allocating £2,800 to depreciation, as against £1,500 in 1913, the net profits are returned at £10,500, as contrasted with £13,600. The dividend amounts to 15 per cent., as in 1913.

The directors of the Land und Seekabelwerke, of Cologne-Nippes, whose share capital of £300,000 is held entirely by the Felten & Guilleaume Co., state that satisfactory results were obtained in 1914, although a portion of the year stood under the influence of the war. The gross profits were £67,000, as compared with £73,000. After defraying general expenses and setting aside £12,000 for depreciation, as against £15,000, the accounts indicate net profits of £35,000, as contrasted with £38,000 in 1913. A dividend at the rate of 10 per cent. has been declared, this comparing with 11 per cent. in the previous year.

The Gesellschaft fur Elektrische Unternehmungen, of Berlin, which has an ordinary share capital of £3,000,000 and loan capital of £2,023,000, owns, or is otherwise financially interested in, many lighting and tramway undertakings both in Germany and in Russia, France and other countries. The directors' report for 1914 states that, with few exceptions, the supply works in the homeland had been prejudiced in their development through the war, whilst those in neutral countries had been similarly affected to a lesser degree. The tramway undertakings had suffered to a greater extent. On the other hand the undertakings in hostile countries, particularly in Russia, had been placed under State control, although it was impossible to form a definite opinion as to their ultimate fate. The accounts indicate net profits amounting to £261,000, as against £318,000, and it is proposed to pay a dividend of 6 per cent., as compared with 10 per cent. in each of the three preceding years.

The report of Voigt and Haeffner A.G., of Frankfort-on-Main, states that working was unfavourably affected in the first months of the war in consequence of the decisive stagnation in railway traffic, and it was only possible to provide some compensation towards the close of the year by embarking upon the production of parts of munitions of war. The requirements in peace manufactures also increased to some extent. But taken as a whole there was a substantial decline in the results over the previous year owing to the large reduction in the turnover, which was all the more comprehensible as it was impossible to curtail the expenses, and the army orders would only appear in the accounts for 1915. As gross profits the accounts indicate the sum of £110,000, as compared with £164,000 in 1913; and general expenses absorb £52,000, as against £50,000; and depreciation £11,000, as contrasted with £13,000. The net profits and balance forward total £49,000, as compared with £104,000; and the dividend is 8 per cent. on a share capital of £250,000, being 4 per cent. less than, in 1913.

The report of the directors of the Deutsch-Allantische Telegraphen Gesellschaft, for 1914, states that during the first seven months an increase in the traffic took place over the corresponding period in the previous year, and an advance was also recorded in the receipts. It was possible for the company to secure a further acceleration in the speed of transmission through the cables. Early on August 5th both cables between Enden and Fayal, in the Azores, and the cables between Enden and Vigo were cut in the Channel beyond the limits of English and French sovereignty, and, in point of fact, evidently on the part of the English. It was at present impossible to foresee when the restoration of the cables and the resumption of working could be effected. The Nord-deutsche Seekabel Werke, in which the company is interested, would pay a dividend of 4 per cent. for 1914, but the share devolving upon the Atlantic Co. would first be included in the latter's accounts for 1915. The accounts show the following figures for 1914 as compared with those in the preceding year:—

					1914.	1913.
Share capital	 			•••	£,1,200,000	£1,200,000
Loan capital	 				873,500	888,500

Dividend per ce		• • • • • • • • • • • • • • • • • • • •			61	7.1
Carried form		•••			16 080	33 000

The fact that the rate of dividend has only been reduced by 1 per cent. is due to the larger amount brought forward in 1914 as contrasted with 1913; the allocation to the reserve fund is less by £11,000, and directors' fees and bonuses are lower by £28,000 than in 1913. The liabilities of £81,000, as against £68,000 in 1913, consist of unsettled accounts with the Eastern Telegraph Co., the Europe and Azores Telegraph Co., the Commercial Cable Co., the savings' account of the officials, and certain other debts.

Angle-Argentine Tramways Co., Ltd.—The directors report that owing to the decrease in traffic receipts for the current year as compared to 1914, and the uncertainty of the outlook, they do not recommend any dividend on the ordinary shares. £96,409 is being carried forward, as compared with £13,421 brought in from 1913.

United River Plate Telephone Co., Ltd. — Final dividend on the ordinary shares, 5 per cent., making 8 per cent. for the year. £6,563 is to be carried forward.

## Eastern Telegraph Co., Ltd. at a care.

The annual meeting was held, on May 12th, at Electra House, E.C. Sir J. WOLFE BARRY, K.C.B., who presided, said that the gross revenue for the year was £1,645,000, which was about £183,000 in excess of the previous year. On the other hand, the total expenses during the same period the other hand, the total expenses during the same period had been correspondingly heavy. From one cause and another they exceeded those for 1913 by about £07,000. There was also an increase of about £3,500 in the interest on 4 per cent. mortgage debenture stock, due to the issue of £103,294 of this stock in November, 1913, to meet some additional capital expenditure. The result of the year's working, therefore, was that after providing for the usual dividends on the various stocks, and the same bonus as formerly—viz., £2 per cent. for the year on the ordinary stock—they were able to carry to the general reserve fund £390,000, the same amount as in 1912. This fund had been charged during the year under review with about £274,000 in respect of new cables and other special expenditure, so that the net addition to the fund for the year was about £116,000. There still remained to be charged £200,000, being the balance of cost of the Aden-Colombo cable. This would be dealt with during the current year. They would no doubt have noticed that the amount set aside as a provision on account of investment fluctuations, which was shown at £325,000; had not been altered this year. When he last had the pleasure of addressing them he pointed out that the operation of varying some of their investments had resulted in an actual realised loss on securities sold of about £66,000, which had been charged against the general reserve fund. Although after liaving done this the approximate depreciation was still slightly in excess of the provision made, there had subsequently been an improvement in the total value of the securities, and they did not think it necessary to increase the provision of £25,000. As the Stock Exchange was closed on the date to which the present accounts were made up, the usual method of valuation could not be adopted, and they felt that even now it was difficult to arrive at anything like an accurate appraisement. They had therefore decided to hold the matter over until the end of the current year, when it was had been correspondingly heavy. From one cause and another they exceeded those for 1913 by about £107,000. There was the older sections in the Red Sea, and the new cable from Aden to Colombo, had materially assisted them in maintaining a satisfactory service to India and the Far East during the exceptional times of pressure which they had experienced, and which still existed, more especially as the alternative route to India by the Indo-European Co.'s system had been centinuously interrupted since July 31st last, and the Government Pacific cable to New Zealand and Australia was also interrupted from September 8th to November 5th. If further proof were required of the importance of maintaining a substantial reserve fund, it could be found in the example now before them, which showed that they had been able to carry out this important work at a cost of about one million pounds, the whole of which had been met by appropriations from the reserve fund. This policy, which the directors had so consistently followed throughout, enabled them to meet any exceptional and unforeseen demands whigh might arise, more particularly at a time such as the present, when so much pressure of work had been so suddenly placed upon them. This great war had been so far reaching, that practically every part of our widespread Empire had been seriously affected, and the necessity for rapid trustworthy means of communication between the Mother Country and the Oversea Dominions had been more than ever realised. Their aim had been not only to improve the speed of their service, but to render it as secure as possible against total interruption. With only a single cable this might occur at any time either from been not only to improve the speed of their service, but to render it as secure as possible against total interruption. With only a single cable this might occur at any time, either from natural causes or, in the event of war, from the malicious acts of enemies. In order, therefore, to provide an efficient permanent service they had taken, for years past, the precaution of connecting the most important points of their system by several cables laid along widely different routes. He knew that their work was appreciated by the Government, and they were glad to feel that they were able to render a useful service to the country. Although certain restrictions had necessarily been imposed by the Government in the regulations affecting commercial, Press and social telegrams, it tions affecting commercial. Press and social telegrams, it must be a satisfaction to all concerned that they had been must be a satisfaction to all concerned that they had been able to maintain a constant service throughout their system. Having referred to the action of the Government in taking possession of the company's offices and controlling the traffic, and the consequent restrictions placed upon private and public telegraphing, as outlined at the meeting of the Eastern Extension Co., the Chairman said there was another matter arising out of the war which he ought to mention. By an agreement dated May 28th, 1878, certain arrangements were made between the company and the Indo-European Telegraph Department of the Indian Government and the Indo-European Co., for maintenance of alternative routes, pooling traffics and dividing receipts in agreed percentages, with the usual provision that in case of interruption of either route for a specified time, the interrupted company should cease to participate in the receipts. The advantages of the agreement were fully explained by his predecessor in the chair to a general meeting held on July 11th, 1878, when the agreement was unanimously approved and full powers were given to the

board to carry it into effect, or modify details. Part of the Indo-European route passed through enemy territory, and that service to India yas' completely interrupted; but the maintenance, or rather re-establishment, of an allied route was as much to their interest now as in 1878. The directors had, therefore, decided to extend the rates and continue the phyments mentioned in the agreement; so as to give the Indo-European group? a reasonable opportunity of establishing an efficient alternative route after the war. Before concluding, he wished to record their appreciation of the patriotic devotion and the high sense of duty shown by the istaff on shore and on hoard their cable repairing ships during a time of such great anxiety to them all. The good results to which he had referred could not have been achieved without their whole hearted co-operation under trying and sometimes risky conditions. The ships' staff had done valuable work in maintaining communication, and the shore staff had dealt with the traffic as expeditiously as possible under the conditions of censorship imposed by the Government. They had been working long hours during week-days, Sundays, and holidays, and all, both on board ship and on shore, had cheerfully given up their periodical furloughs in order to meet the demands of their country. In saying this, he included not only the staff abroad, saliore and allout, but also in a marked degree the head office staff and their employes at the stations in Great Britain. It being impossible speedily to replace their highly trained and technical staff, the authorities did not desire them to enlist; and although many of them would have liked to take a more active part in the war, they had—with some few exceptions—accepted the ruling of the Army Connoil, who had expressed the view that, having regard to their special qualifications, they were serving their country better by remaining at their posts than by joining the fighting forces. A large percentage of the administrative staff at head office had, h

## Calcutta Electric Supply Corporation, Ltd.

Calcutta Electric Supply Corporation, Ltd.

The annual meeting was held, on May 13th, at the offices, 2, Broad Street Place, E.O. Mr. Pader V. Luke, who presided, said that the capital expenditure during the year (£61,443) had been necessitated by the normal expansion of the business and was an indication of satisfactory progress. In order to provide the funds necessary for capital expenditure on additional plant and mains, the directors issued £100,000 of additional capital last January; half in ordinary shares at a premium of 10s, per share, and half in preference shares at par. The shares were fully subscribed and the premium on the ordinary issue, amounting to £5,000, had been added to the reserve fund and invested. In regard to the reduction in generating costs, which was a very satisfactory result of the very large capital outlay involved in the high-tension scheme completed in 1913. It would be a sufficient indication of the good results to say that, roughly speaking, in 1914 24 million more units were generated than in 1913, while the generating costs were 63,500 rupees less. The principal item in generating costs were 63,500 rupees less. The principal item in generating costs were 63,500 rupees less. The principal item in generating costs were 63,500 rupees less. The principal item in generating costs were 63,500 rupees less. The contract of the period of charges, both in the price of current and meter rent. The desire for a reduction in the price of current and meter rent. The desire for a reduction of id. per unit came into force from July 1st last. The directors had now decided to reduce the meter rent by one-half as from July 1st next. That concession would mean a nanual difference to the corporation of some £7,000. A still further reduction in the price of current for lighting was now under consideration, and it was hoped that shortly it might be possible to arrange for this, but in the present unsettled state of affairs it was necessary to weigh future possibilities very carefully. With regard to

increased cost of materials, higher freights, and increased traction would no doubt cause it to be more felt during the current year. So far, he was glad to say, the revenue showed no signs of decreasing. Street lighting had made good progress, and was likely to increase as the advantages of the electric light became appreciated. In order to stimulate a new demand that seemed capable of development the directors had sentimed a special rate of one apprecial rate of one apprecial controlled. new demand that seemed capable of development the directors had sanctioned a special rate of one anna per unit for current for cooking and heating purposes. At the last meeting an inquiry was raised as to the large number of units classed as "unaccounted for." That matter had received the close attention of the directors and the consulting engineer, and a certain improvement was shown in comparing the figures for 1913 with those for 1914, and there was a still further improvement in the current year. Taking everything into account, the results for the past year could not be considered as other than quite satisfactory. Seeing that the profits were sufficient, the directors had decided to recommend the same dividend as last year; but in view of possible contingencies resulting from the war, they would carry forward a larger sum than usual, and they had also decided to place a sum considerably above the normal to the depreciation and renewal fund.

Sir Guilford L. Molesworth seconded the motion, and

Sir Guilford L. Molesworth seconded the motion, and

the report was adopted.

## Delhi Electric Tramways and Lighting Co., Ltd.

Delhi Electric Tramways and Lighting Co., Ltd.

The directors report that the gross receipts for 1914 were:—Tramway undertaking £9,798, electric supply undertaking fincluding £2,981 on account of current sold to tramways £18,887. The revenue from the tramway undertaking shows an increase of 10 per cent. over 1913. The increase is due to the policy of lower fares. The gross revenue from the electric stipply undertaking (excluding the supply to the tramway) shows an increase of 19 per cent., and further expansion in the revenue from this branch may be hoped for as soon as additional mains can be installed. The demand for supply for power purposes is satisfactory, and efforts are being made to develop this department of the business. The combined undertakings show a net revenue of £8,163, as compared with £6,252 in 1913 and £2,990 in 1912. After charging general expenditure in London and Delhi, and debenture and loan interest, the profit and loss account shows, a profit of £3,938, plus £214 brought forward. There has been put to depreciation reserve account £4,000, to renewals reserve account £74, and £78 is to be carried forward. The result may be regarded as encouraging, in view of the fact that during the latter period of the year a reduction in revenue in both branches of the undertaking has been experienced, due to the war. The whole of the plant and equipment, including rolling stock, has been systematically overhauled during the latter period of the expenditure charged to revenue. The upkeep of the cars is still a heavy item, owing to the single motor equipments, and, as soon as funds can be provided, it is the intention to instal cars with double motor equipments in maintenance. The new Diesel engine and generator have given satisfaction since their installation in June last. Owing to the continually increasing demand, it has become necessary to provide a link with the Government power station. The cost of the necessary plant, together with additions to feeder eables which are being installed, will have to

United River Plate Telephone Co., Ltd.—The directors recommended a final dividend of 5 per cent. on the ordinary share capital, making, with the interim dividend paid on November 2nd last, a return of 8 per cent, for the year to December 31st, 1914, free of income-tax, carrying forward £6.562.

River Plate Electricity Co., Ltd.—The directors announce that the net revenue for 1914 amounted to £31,000, against £42,201 in 1913. A dividend of 8 per cent. on the ordinary stock is recommended, carrying forward £20,512.

Mirrlees, Bickerton & Day, Ltd.—The directors report that for the year ended March 31st the net profit, after providing for depreciation and directors fees, was £15,608. After paying 7½ per cent., less income-tax, on the ordinary share capital, and placing £5,000 to the reserve fund, £1,753 is being carried forward.

New British Ever-Ready Co., Ltd.—The directors recommend a final dividend of 6½ per cent. on the preference shares, making the maximum of 10 per cent. for the year to March 31st, and 10 per cent. on the ordinary shares for the year, plus a bonus of 2 per cent.

Aron Electricity Meter, Ltd.—A meeting of first mortgage debenture-holders (5 per cent.) is being held to-day at Cannon Street Hotel to consider resolutions modifying the rights of these holders until the end of the war.

Brisbane Electric Tramways Investment Co., Ltd. —The revenue account for 1914, consisting of the dividend received from the Brisbane Tramways Co., Ltd., amounting to £143,904, together with sundry receipts and the amount brought £143,904, together with sundry receipts and the amount brought forward from the previous year amounting to £3,809, less charges in London and Brisbane amounting to £3,649, shows an available balance of £144,063, which the directors have dealt with as follows:—Reserve fund (bringing it up to £100,000), £50,000; accidents insurance fund (bringing it up to £10,000), £7,000; debenture stock interest, £18,689; preference dividend, £17,305; interim dividend on the ordinary shares, £24,000. Out of the remaining balance the directors now recommend that a balance dividend of 4s. per share, free of income-tax, be paid on the ordinary shares (making a total dividend for the year of 8 per cent.), and that £3,070 be carried forward. After the above appropriations the renewal and reserve funds of both companies will amount to £230,000, with an aggregate of balances carried forward of £5,952.

Mexican Northern Power Co.—Mr. W. J. Ross, the new president of the Mexican Northern Power Co., has issued a circular to the first mortgage bondholders urging them to subscribe for \$1,000,000 prior lien bonds at the rate of \$77.50, or \$775 for \$1,000 of bonds. The money is required to pay debts, complete the Boquilla dam, transmission lines to Parral and Santa Barbara, the sub-station at Parral, and distribution lines, at a total cost of \$675.000. - Financier

Castner-Kellner Alkali Co., Ltd. — The directors have declared an interim dividend at the rate of 16 per cent. per annum for the six months ended March 31st, 1915.

Craigpark Electric Cable Co., Ltd.—The annual meeting was held in Glasgow on May 12th. Mr. W. S. Brown, who meeting was held in Glasgow on May 12th. Mr. W. S. Brown, who presided, said the company, like other firms, had suffered through the war. Their output was somewhat down, but that was because a great number of their men had gone to the front, and they were unable to fill the vacancies. They had made some little provision for the dependents of these men, and he thought they were very well able to do so. Their works were now, however, fully occupied. The material turned out at present was of a very solid and good character. It was principally work for the Government, and he understood was giving every satisfaction. Although somewhat down, the output, as a whole, was quite satisfactory. The report was adopted, and Mr. G. A. Buchanan, who it was stated, was at the front engaged in motor ambulance work, was re-elected as at the front engaged in motor ambulance work, was re-elected a director.

Change of Address.—The address of the following companies has been altered to Electric Railway House, Broadway, Westminster, S.W.:—London and Suburban Traction Co., Metro politan Electric Tramways, London United Tramways, South Metropolitan Electric Tramways and Lighting, North Metropolitan Electric Power Supply, North Metropolitan Electrical Power Distribution, Tramways (M.E.T.) Omnibus, and Gearless Motor **Omnibus** 

## STOCKS AND SHARES.

TUESDAY EVENING.

This week's sentiment has gone some way towards banishing the gloom, amounting to depression, which weighed upon markets after the sinking of the Lusitania. The United States Note to the German Government was welcomed as being about as much as could have been expected from the Americans at the present time. Its firm tone and the absence of diplomatic verbiage produced a favourable impression after the first hasty generalisations about a blow having been struck at America which the latter could only avenge by declaration of war. With the calming of men's minds, there has returned that normal hopefulness and confidence which have animated the nation throughout; and the Stock Exchange barometer of public feeling already gives signs of improving markets and better prices.

At home, the domestic difficulties of London, brought about by the tram way strike, have followed so closely upon the heels of the anti-German riots that the horrors of the previous week have been to some extent removed to the background. The country, as a whole, has started again to invest money, and once more there are

whole, has stated again to hvest money, and once more there are buyers for all the best-class securities.

The tramway strike would in the ordinary way have been held as a bull point for the omnibus companies, but the lurking fear lest the trouble might extend to the ranks of the omnibus employés lest the trouble might extend to the ranks of the omnibus employés has prevented any advantage according to the stocks and shares connected with the 'bus business. It has been denied, of course, that these undertakings will be affected: and so far as limited personal observation goes, most people will probably agree that they have found the 'bus men well contented with their present lot. It may be recalled that quite recently the employés of the Tube companies received advances in wages, so that the further hint that they, too, might be drawn into the tramway disaffection, savours more of a threat from the promoters of the latter than of inherent likelihood. No particular surprise will be felt at the intention of the London County Council to oppose the Bill for the proposed closer agreement between the Tubes and the Bill for the proposed closer agreement between the Tubes and the London General Omnibus Companies.

Prices of London Tramway issues have been extremely dull for

ome time past. The 4 per cent. Debenture stock of the London United Tramways was only 55 when war broke out, and is now about 52. London and Suburban Traction Ordinary stand about about 52. London and Suburban Traction Ordinary stand about 2s. 6d., the Preference at 8s. 9d., and the 4½ per cent. Debenture stock is nominally 63. Metropolitan Trams 4½ per cent. Debenture stock last changed hands at 80¾, and the Fives at 85; while South Metropolitan Electric Tramways Debenture stock, which was 66 at the end of last July, has not been dealt in since the Stock Exchange re-opened. Tramways (M.E.T.) Omnibus 4½ per cent. Guaranteed Debenture keeps its price fairly well at 90.

London General Omnibus Debenture stocks stand at 97 and 87½ for the 4½ per cent. Firsts and the 5 per cent. Income Debentures respectively. Underground Electric 6 per cent. Income Bonds have

respectively. Underground Electric 6 per cent. Income Bonds have recoded a trifle to 79. The £10 shares have fallen to 32a, 6d., and the shilling shares keep fairly firm, about 5s. 6d. Metropolitan Railway Consolidated stock is dull at 29. Districts remain at 17, there being no sign of animation in Home Rails, except the stocks of the "Heavy" lines. Buyers still want the offer of Central London issues, of the assented variety; and the Ordinary has risen

a little to 79.

Sir Edgar Speyer's retirement from his various public positions, Sir Elgar Speyer's retirement from his various public positions, including that of the chairmanship of the Underground Electric Railways Company of London, may have something to do with the dulness of the issues in this particular company. From the market point of view, however, it is not thought that the company is likely to suffer materially, inasmuch as it is fully expected that Sir Elgar will continue to exercise his influence upon the direction of the company's affairs, though in a less prominent capacity than that which he has occupied hitherto.

Electric Lighting shaves are extramely consecent and through.

Electric Lighting shares are extremely quiescent, and through-

out the list there is not a single change this week. Of the manufacturing issues, Edison & Swan of both classes are rather easier, the fully-paid dropping to  $1\frac{\pi}{6}$ . Electric Constructions, however, are better at 14s. for the Ordinary and  $1\frac{\pi}{18}$  for the Preference, thanks to the declaration of a dividend on the first-named of 6 per cent.

to the declaration of a dividend on the first-named of 6 per cent, which is an increase of 1 per cent. for the year. Anticipation had looked for a continuance of the 5 per cent. rate, so that the improvement came as a pleasant surprise. There is rather more doing in Castner-Kellners, the company having declared an interim dividend at the rate of 16 per cent. per annum, as against 10 per cent. a year ago; the price of the shares holds steadily to 3\frac{1}{2}.

The group of Latin-Canadian companies has been further upset by the death of Dr. F. S. Pearson, who was one of the victims of the Luxitania. Dr. Pearson was well known in the City here, and his activities covered a huge range. Many of his interests lay in Mexico, but prices have remained much about the same as they were previously, only the tone of the market showing a certain weakening from what it was before. Mexico Tramway bonds went back 2 points to 56. Mexican Light Preferred eased off to 41. Brazil Tractions lost a point, owing to the unpleasant crumble in the Rio exchange rate, which got back to 12\frac{1}{3}\frac{1}{2}\dagger\$, but recovered again to-day (Tuesday). The Argentine Tramways Debantures have drooped also, the Firsts to 81, so that the yield on this stock at the present time is practically 5 per cent. on the money; having regard to the solid nature of the security, the price now must be considered cheap.

must be considered cheap.

Brisbane Electric Tramways Investment Company has declared a dividend of 4s per share, making the usual 8 per cent. for the year, and the price keeps very steady about 7½, while the 5 per cent. Preference shares are a few pence under their par value of £5. The 4½ per cent. First Debenture stock stands at 98½. The River Plate Electricity Company has reduced the dividend on its Ordinary stock from 10 per cent. to 8 per cent., but the carry forward of £20,512 is £7,500 better than it was a year ago. The last transaction recorded in the stock was four months ago, when the Ordinary changed hands at 190—some 50 points lower than it stood when the war broke out. No doubt the Company has been affected by the financial and commercial difficulties with which the Argentine Republic has been beset owing to the war.

Telegraph stocks are a little hesitating. Great Northerns are ex 34s, dividend, and Indo-Europeans are ex 52s. 6d., allowing for which the latter show a rise of 10s. on the week, while Great Northerns are a shade easier. The last-named points out in its report that at any moment the Company may be placed in a difficult position as a result of the development of hostilities. The Company, as mentioned here before, has just raised its dividend from 20 per cent, to 22 per cent,; but the carry-forward of  $\pm 86,700$  is £23,000 less than that for 1913.

The changes in the Eastern group are of insignificant proportions. Cuban Submarines have eased off to 8½ in consequence of the reduction in the dividend to 5 per cent. Cuban Telephone 5 per cent. Bonds came into the market the other day at 80½. West India and Panama shares have given way a little. The Telephone India and Panama shares have given way a little. The Telephone group keeps very steady. United River Plate Ordinary are to receive their regular dividends of 5 per cent., making 8 per cent. for the year; and the £5 shares changed hands a few days ago at 616, which is almost exactly the same price as they were at the end or last July. New York Telephone bonds and the Marconi group have fellen proproper onict days.

or last July. New York Telephone bonds and the Marconi group have fallen upon very quiet days.

Rubber shares are better, thanks to a gradual hardening in the price of the raw material, until now it stands at a shade above 2s, 5d, per lb. A good deal of business is being done in the leading shares, and rather a feature of the past few days has been the improvement in certain of the florin variety which have been standing round about their par price. Copper shares have been on the rise. The giant Amalgamated Company, by the way, is to be dissolved next month, when its assets will be distributed—chiefly in the shape of Anaconda shares. Armaments show comparatively triffing changes. Prices keep hard, but there is scarcely paratively trifling changes. Prices keep hard, but there is scarcely a shilling movement in any of them from the beginning of a week to its end.

Melbourne Electric Supply Co., Ltd .- The directors announce an interim dividend at the rate of 10 per cent, per annum, free of income-tax, on the consolidated ordinary stock for the half-

Willans & Robinson, Ltd.—The annual meeting was held on May 13th at Rugby, when the report was adopted. We shall report the proceedings next week.

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING APRIL, 1915.

THE April returns of electrical exports from this country must be considered satisfactory, being but little below the comparatively high level of the previous month.

The actual totals were for April £382,610; for the previous month £391,850.

The April imports, valued at £230,752, show a considerable increase on the March total of £203,759; and the re-exports for April, at £11,167, compare with £8,297 last month.

While the previous month's export total benefited considerably from the inclusion of over £100,000 worth of telegraphic business, the satisfactory April total is due to improved export business in machinery, cables, telephonic material, lamps, &c.; the value of electrical machinery exports was approximately £150,000 for the month.

Practically every branch of the electrical imports expanded in value during April, but while Continental imports fell off on the whole, our American cousins increased their business with us by some £51,000 as compared with March.

Our best customers during the month were India, Argentina, and France, while good business was also done with our Australasian

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third column contains many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

## STANDARDISATION RULES FOR ELEC-TRICAL MACHINERY.

## (Excluding Railway and Tramway Motors.)

IN April, 1913, the Council of the British Electrical and Allied Manufacturers' Association adopted a code of rules ALLIED MANUFACTURERS' ASSOCIATION adopted a code of rules for the standardisation of electrical machinery, which was published in our issue of May 23rd, 1913. These rules have now been re-issued, without alteration, as it is expected that the Engineering Standards Committee will shortly issue the first section of the new British standard rules—otherwise certain changes would have been made.

When the rules were first published, it was stated that additional sections were under consideration; these have now been incorporated in the code in the form of a supplement, which is reproduced below.

## SUPPLEMENT.

## SECTION VII.—TOLERANCES.

(1) A tolerance is the amount of permissible difference between the observed results and the guaranteed results.

(2) When the difference between the observed and the

- (2) When the uniference between the observed and the guaranteed results is not greater than the tolerance, it shall be considered that the guarantees have been met.

  (3) In the event of the observed results differing from the guaranteed results by an amount greater than the tolerance, the penalty or bonus (if any) shall be taken only on the amount by which the observed deviation from the guaranteed results exceeds the tolerance. results exceeds the tolerance.
- (4) The "guaranteed" figure referred to is the figure written in the contract documents, and not that figure plus a margin or tolerance.

The following tolerances are recommended:-

(5) For observations of temperature rise, 2° Centigrade.

(6) Efficiency.-

- (a) By steam consumption, 21 per cent. on the guaranteed efficiency.
  - (b) Transformers (by summation of losses)—

Full-load efficiency.	Tolerance
98 p.c. or higher	0.25 p.c.
Below 98 p.c.	0.4 p.c.

(c) Generators, motors, converters—

Note.—The following values apply to determination of efficiency by summation of losses. If the efficiency is to be determined by method of input-output test, the tolerances as shown should be increased one-half of 1 per cent. for guaranteed efficiencies not lower than 88 per cent., and they should be increased by 1 per cent, when the guaranteed value of efficiency is below 88 per cent.

(8) Guarantees at Fractional Loads: Average-Load Guarantee. —When guarantees are required upon performance at fractional loads, they should be given in the form of an "Average-Load" guarantee, thus:—

Full-load efficiency	 	 	 ×	4
Plus 4 load ,,	 	 	 ×	;;
Plus & lead	 		×	.)

The sum of these divided by 9 gives the "Average-Load" value.

The tolerances for "Average-Load" guarantees are those shown opposite similar values in the first column of the corresponding tables above.

(9) Speed of Motors.—

- (a) With shunt characteristics (above 3 H.P.).—Tolerance, 5 per cent, above or below guaranteed speed at the temperature of full-load.
- (b) With series characteristic.—Tolerance, 7½ per cent, above or below guaranteed speed at the temperature of full load.

(c) Slip of Induction Motors.—Tolerance, 50 per cent. on the listed value of slip.

(10) Inherent Pressure Regulation Rise.-

Tolerance, two-fifths of the value specified for regulation.

## SECTION VIII.—PARALLEL OPERATION OF SYNCHRONOUS Machines.

In order to guard against unsatisfactory operation when alternators are run in parallel, it is necessary to satisfy two conditions :-

(1) There must be a limit to the amount of angular displacement from uniform running due to periodic irregularity in the turning moment of the prime mover. Such recurring angular displacement causes objectionable swinging of the animeter needles, and, if excessive, will cause fluctuation in lighting, and throw out of step synchronous machines running on the system.

### Note relating to Condition (1).

A periodic angular displacement of 21 electrical degrees from A periodic angular displacement of 24 electrical degrees from position of uniform rotation with a machine of ordinary type will cause 15 per cent. to 20 per cent. exchange current; the angular displacement should not exceed this limit of 24 electrical degrees. This limit will be exceeded if the cyclic speediregularity of the engine exceeds that given by the expression: pression:-

Cyclic speed-irregularity = k/6p

where k = engine impulses per revolution p = number of poles.

It is important that the expression indicating the degree of irregularity should be correctly understood. As most firms have approved the term "cyclic irregularity" with the definition

Maximum speed minus Minimum speed Mean speed

members are recommended to adopt this term.

The irregularity should not in any case be worse than 1/150, otherwise there may be objectionable flickering in lamps and difficulty in running other synchronous machinery on the system. (In the case of a continuous current generator the limit of 1/150 to cyclic speed-irregularity also applies, but there is no further limit depending on the resulting angular there is no further limit depending on the resulting angular displacement.)

(2) It is necessary to safeguard against hunting due to resonance between any periodic inpulses of the engine and the natural oscillating frequency of the electro-mechanical system of which the generator forms a part. This may be met in either of two ways:—

(a) By providing a fly-wheel of such weight that the natural

oscillating frequency is sufficiently different from the frequency of the engine impulses.

(b) By providing dampers on the generator to check the development of hunting due to resonance.

## Note relating to Condition (2a).

The natural frequency of the machine when connected to the system should be at least 20 per cent. lower than the frequency of a possible irregular impulse. In a steam engine, either single or double-acting, and also in a two-stroke cycle, internal-combustion engine, this latter frequency corresponds to the crankshaft R.P.M., while in a four-stroke cycle engine the frequency is one half the crankshaft R.P.M. To meet this condition with machines of ordinary regulation, the total amount of fly-wheel effect required is given in foot-tons of stored energy at normal speed by the following formula:—

Foot-tons:

1.3 × poles × (strokes per engine cycle)² × K.V.A. ÷ R.P.M.

## Note relating to Condition (2b).

Method 2b can only be relied upon so long as the coefficient of fluctuation of energy is kept within the limit specified below, but when this method is employed it avoids the necessity for the heavy and expensive fly-wheels required by method 2a, particularly in the case of slow-speed, gas-engine driven sets driven sets.

Electrical manufacturers guarantee satisfactory parallel operation only so long as the limit specified herein is not exceeded; if the limit is exceeded due to the engine misfiring. valves leaking, or other abnormal cause, method 2b cannot

be relied upon.

The limit referred to above is as follows:-

The coefficient of fluctuation of energy should not exceed 10 per cent.

This coefficient is defined in the following manner:-

If a mean-effort line should be drawn, then the largest of the areas lying above or below the mean-effort line is called the fluctuation of energy, and the ratio of this area to the total area bounded by the mean-effort line over one complete cycle is the coefficient of fluctuation of energy.

## SECTION IX.—COMMUTATION.

D.C. machines must operate throughout the range from no load to the highest specified overload with fixed brush setting.

The operation must be practically sparkless from no load to full load, and without injurious sparking up to the maximum specified overload.

## SECTION X.-SHORT-CIRCUIT TESTS ON ALTERNATORS.

Sudden short-circuit tests should not be undertaken, nor

surfaces given against short circuits in service, upon alternators which are required to have close inherent regulation, since such machines, due to their large flux and weak armature reaction, suffer most severely in case of short circuit.

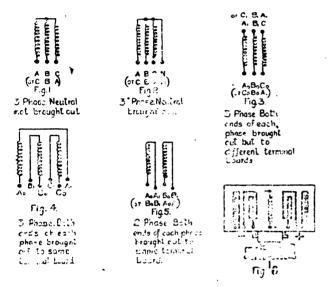

Any regulator which will give close voltage regulation throughout the entire load range, will permit of the machine being designed with the proportions best suited to withstand short circuit. Hence close inherent regulation is an unnecessary requirement.

sary requirement.

When, in the absence of restrictions as to regulation, it is still difficult to produce a design sufficiently self-protective,

## MACHINES.

Arrangement and Markings of Terminals (see Section XII.).

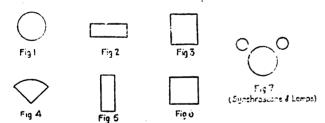

reactances may be employed, external to the machine, to assist in limiting the severity of the short-circuit current. (In case of machines wound for high voltage, external reactances are sometimes employed to protect the windings from voltage surges. Reactances, employed to limit the short-circuit current, may be arranged to seve as reactance screens for the

rent, may be arranged to serve as reactance screens for the last-mentioned purpose also.)

The severity of short circuit in any particular machine depends on the amount of flux, and not on the amount of excitation or load present at the instant. Tests should never be undertaken at a voltage higher than the normal for the purposition. machine.

When making short-circuit tests, a solid contact should be made, as an arcing contact might cause puncture between the machine windings. If it is desired to reduce the effect of short circuit, reactance in preference to resistance should

INSTRUMENT OUTLINE SYMBOLS (see Section XIII., Rule 3.)

Note.—Other outlines may be made to indicate instruments of special shape.

be used, or the voltage of the machine reduced, as resistance tends to improve the power-factor of the short circuit, and thus increase the mechanical shock upon the shaft.

## Section XI.—Transformers—Terminal Markings. . Three-phase Transformers.

(1) Lettering.—The different phase windings are to be distinguished by the letters  $\Lambda$ , B, C, indelibly marked on their respective terminals.

Note.-It is recognised that with some standard makes of Note.—It is recognised that with some standard makes of transformers it is not possible to arrange the terminals in the order A. B. C on both high-pressure and low-pressure sides, without introducing objectionable crossings amongst the leads within the transformer. Provided the terminals are properly marked in accordance with these rules, their actual position upon the case is of secondary importance.

(2) Similar Letters on High and Low-pressure Windings.—The same letters are to be used on the high-pressure and low-pressure terminals of similar phases.

(3) Distinction between High and Low-pressure Markings.— The distinction between "high-pressure" and "low-pressure" terminals in any phase shall be made preferably by using small letters for the low-pressure markings, and capitals for

the high-pressure markings. It is, however, permissible to indicate the low-pressure winding by the use of capital letters with a circle around each letter.

(4) Marking of Polarity.—The relative polarity of the two ends of every winding will be shown by the addition of the markings 0 and 1 after the phase letters.

(5) Polarity of Low-pressure with respect to High-pressure Markings.—The terminal marked 1 will be referred to as the positive end of the winding.

The polarity of the corresponding high-pressure and low-pressure windings must be so marked that the progression of the E.M.F. at any moment from  $A_0$  towards  $A_1$  is in the same direction as from  $\bullet_0$  towards  $\bullet_1$  (and similarly for phases B and C). That is to say, if the negative terminal of

the high-pressure winding is connected to the positive terminal of the low-pressure winding, the E.M.F. across the two remaining terminals will be more than that across the high-pressure

ing terminals will be more than that across the high-pressure winding alone.

(6) Marking of Tappings.—The markings 0 and 1 are placed on the two terminals which give normal voltage. Each tapping terminal will be marked with its fractional value in terms of the normal voltage; or with an arbitrary number, referring to the diagram under Rule 7. The employment of fractional-value markings upon the terminals when adjustment tappings are provided is left optional. When this marking is employed, the terminal marked 1 need not be at the extreme end of the winding. If this method of marking is not employed, the taps must be numbered arbitrarily, and the diagram to be provided must show the values of the different tappings. When the adjustment tappings are provided in connection with an independent section of the winding which may be reversed in polarity, this auxiliary winding shall take the same phase letters as the section to which it belongs, and its various leads and tappings will be indicated by arbitrary numbers. numbers.

(7) Diagram Permanently Attached to Transformer.—It is recommended that a diagram of internal connections showing the position of all leads and tappings shall be permanently attached to each transformer.

(8) Marking of Tappings on the Switchboard Diagram.—On the switchboard diagram adjustment tappings need not be shown.

#### SINGLE-PHASE TRANSFORMERS.

The high-pressure terminals will be marked  $T_0$   $T_1$  and the low-pressure terminals will be marked to t1 in accordance with Rules 3 and 4.

The markings will be so applied as to give the relative polarity of high-pressure and low-pressure windings indicated in Rule 5.

Rule 6 regarding the marking of tappings applies also to single-phase transformers.

## SECTION XII.-MACHINES-MARKING AND ARRANGEMENT OF TERMINALS.

(1) For A.C. machines, the letters A B C should be adopted to indicate the external connections of a three-phase machine, and the letter N should be used to indicate a neutral connection. Where

Where both ends of each phase are brought out,  ${\bf A_0}$   ${\bf A_1}$   ${\bf B_0}$   ${\bf B_1}$   ${\bf C_0}$   ${\bf C_1}$  should be used to denote the three phases.

(2) The terminals of a synchronous generator should be arranged and lettered consecutively in the order of actual phase progression.

The lettering will therefore progress from either left to right, or from right to left, according to the direction of rotation (see figs. 1 to 5, p. 743).

(3) In the case of a standard A.c. motor, where the actual order of phase progression is usually not known, it is recommended that the phase terminals shall always be arranged and lettered in the order from left to right (see figs. 1 to 5,

Note.—Induction motors used with rotary converters are regarded as special, and are not subject to these rules.

- (4) Terminals on large D.C. machines should be arranged in order of polarity from right to left, looking at the commutator. A standard generator has its positive terminal on the right and should be so marked (see fig. 6, p. 743).
  - (It is not necessary to mark polarity on motors.)

## SECTION XIII.—RULES FOR SWITCHGEAR SYMBOLS.

- (1) Diagrams.—In general diagrams, the apparatus should be drawn as viewed from the main operating position. Machines and cables in the station should be drawn as viewed from above.
  - (2) Colouring and Arrangement of Phases .-
- (a) The arrangement of bus-bars should be such that the red and blue phases are outside, and the bars should be indicated in the order of the National Colours—Red, White (or Yellow), and Blue (R, Y, B).
- (b) When arranged horizontally, the red phase should be at the top, or the bar farthest away as viewed by the operator from the main control position in any direction.
- (c) When arranged vertically the red phase should be to the left, or the bar farthest away, as viewed by the operator from the main control position in any direction. (See figs. 25 and 26, p. 743).
  - (3) Outline Symbols for Instruments.-
- (a) From the outline symbols shown on p. 743, a shape should be selected to suit the instrument. Within this outline will be placed the symbol letter or letters selected from the Jist, Rule (4).
- (b) Instrument terminals if shown should be indicated by dots, the positions of which are varied to suit different makes of instruments.
- (c) Any further features which are desired, such as auxiliary switches, instrument windings, instrument terminals, should be indicated by showing their appropriate symbols within the outline.

(4) Symbol Letters for Instruments (referred to in Rule 3a).

- (5) Symbols, Switches, and Connections .-
- (a) The symbols to be employed for switches and connections are shown on p. 743.
- (b) Fixed contacts are represented by dots; movable contacts are represented by circles. A solid dot represents a contact which cannot be broken without unbolting.
- (6) Miscellaneous Gear.—The symbols to be employed for miscellaneous gear are shown on p. 743.

## TECHNICAL EDUCATION IN INDIA.

[FROM OUR SPECIAL CORRESPONDENT.]

A good deal has been said and written about this subject of recent years in India; and a good deal has been done by the various technical colleges to turn out the sort of Indian engineer required to fill vacant engineering posts. The colleges which perhaps have done most are the Victoria Institute, in Bombay; the Sebpier Engineering College, in Bengal; the Thomason College, in Roorkee; and, of more recent date, the Engineering College in Madras and Mysore. Much, however, remains to be done, and it is due to the Roorkee College to say that serious efforts are being made to induce the right kind of students to come forward and prepare themselves for a useful engineering career, in which there are increased openings year by year. An official note is just being issued from Roorkee relating to the new technical classes for students who care to take up a thorough course of mechanical or electrical engineering. The note states as follows:-

"There is known to be a demand in India in the mechanical and electrical engineering profession for men who, after training in a properly equipped institute, are willing to gain their practical experience by apprenticeship on a living wage, to work with their hands, and to observe factory hours and rules. For the civil engineering profession men can be trained in an institute directly for the various grades, the engineer and the subordinate, but even then they will require a certain amount of practical training. In the mechanical and electrical engineering professions, which require very great practical qualifications, however carefully a man may be trained in a technical institute, he is useless to an employer of labour till he has had practical experience; all must work alike and must in all cases begin at the lowest stage and work up gradually in time. This employment is open to Indians of every caste and creed, grade of social position or education, provided the above conditions are observed, and the position to which a man can rise depends on his individual ability and perseverance. Students must thoroughly understand that they are totally unfit for any position of authority on leaving the institute, and that they must first of all be subjected to workshop discipline and learn under practical conditions the details of the work which they eventually hope to supervise. They must be prepared to go into mills, factories and workshops with the full knowledge that they will meet with serious opposition from men, perhaps socially and educationally their inferiors, but who. "There is known to be a demand in India in the mechanical ledge that they will meet with serious opposition from men, perhaps socially and educationally their inferiors, but who,

because they have worked themselves up from the point at which the apprentices are now starting, are of much greater value to their employers than they are at present.

"Given equal practical qualifications a man with a sound education at a technical institute must in time rise to the higher posts of authority over those who have not had these opportunities; but with all, practical knowledge and grit must be present. It is to provide men of this calibre that the technical class is formed.

"The students in this class will be required at the end of their first year's course to specialise in one of the following branches:

- "1. Mechanical Engineering.
- "2. Electrical Engineering.

## "(1) MECHANICAL ENGINEERING.

"(1) MECHANICAL ENGINEERING.

"The course in mechanical engineering is intended to qualify students, after a practical apprenticeship, for employment in engineering workshops, belonging to Government, railways, or private firms. The training at the College will be as practical as possible, giving students a working knowledge of the principles of power generation and transmission, of workshop processes and machine tools, of modern methods of workshop production and cost, and the preparation of working drawings and estimates. As the College cannot give a student a complete practical and commercial training, they must serve an apprenticeship in workshops after their college course, to qualify them for posts of responsibility. If the two years' apprenticeship is served in direct connection with the working of prime movers and steam boilers, apprentices on the conclusion of their apprenticeship, will, on the recommendation of their employers, be permitted to sit for the second-class engineer's certificate under the United Provinces Boilers Act, without previously sitting for the driver's examination. As there are openings for real mechanical draughtsmen in India, the course will also aim to qualify students to take up posts of responsibility in engineering drawing offices. It is not intended to train tracers or copyists, but men who, after acquiring experience, can initiate and improve designs and prepare estimates and working drawings for the shops. for the shops.

## " (2) ELECTRICAL ENGINEERING.

"The course is arranged to prepare students for employment on electrical installation for lights, fans, and motors for machine driving, pumping, traction, and general power pur-

"After obtaining the necessary practical experience by a two years' apprenticeship on commercial works, they should be qualified for employment as follows:—

"(a) Taking charge of electric light, fan and power installa-tion (isolated plant), requiring knowledge of connecting-up, starting and running the various items of the plant, the application of working tests to keep the plant in good running order, and the making out of specifications for renewals and extensions arising in the ordinary course of working.

"(b) Contracting and tendering for supplying, wiring and fitting electric bells and telephones, lamps, fans and motors, where a public or private supply is available, requiring a knowledge of the use and fitting up of the above apparatus, and the special advantages of different types, also the tests which the work must satisfy in order to be passed.

"(c) Appointments in charge of sections of the plant or business of supply companies of engineering firms (shift engineers, mains engineers, etc.), requiring a general knowledge of erection, maintenance, testing and repairs.

of erection, maintenance, testing and repairs.

"Candidates will be statutory natives of India not under 17 and not over 21 years of age. Having furnished certain testimonials as to character and proved certain educational qualifications, candidates will be required to pass an entrance examination, which will be held in June at Roorkee, Allahabad, Lucknow, Naini Tal, Mussoorie, Lahore, Rangoon, Nagpur, Shillong or Bankipur. The course will extend to five years. Three years will be spent at the College. At the end of the first session students will be required to choose one of the following branches to specialise in (1) mechanical engineering: (2) electrical engineering. For the remaining two years of the course students will, if possible, be formally indentured out to some employer in the branch they have chosen. On the conclusion of the five years' course a college certificate will be issued." will be issued.

If the above opportunities succeed in attracting the right kind of man, then a real want will in due course be supplied. Some very first-rate Indian engineers have undoubtedly been turned out of the various Indian colleges, but the percentage of first-rate men to the total number of engineering students on the rolls is small indeed. It is to be hoped that the wide scope of the new Roorkee syllabus will gather in young men with the engineering instinct, and eventually send them forth fully equipped to take important positions in engineering posts in India, of which there are many.

There will for very many years yet be a good demand for European engineers from home to fill the more important

## THE POWER SUPPLY OF THE CENTRAL MINING-RAND MINES GROUP.

By J. H. RIDER, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, April 15th, 1915.)

(Concluded from page 707.)

## ELECTRIC DISTRIBUTION.

The power company's electric supply is given at normal pressure of 2,100 volts and 525 volts at the consumers' terminals. The distribution switch-houses belonging to the mines are built either at right angles or parallel to the power company's transformer houses, and the supply terminals are brought just through the party wall. In parallel switch-houses the 2,100-volt switchgear is arranged in line at one end and the 525-volt switchgear in the same line at the other end. In right-angled switch-houses the 2,100-volt switchgear is arranged on one side and the 525-volt switchgear on the other, with a common operating passage between them.

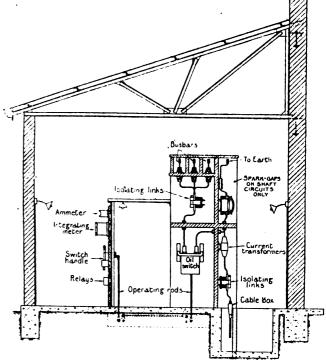

Fig. 7.—Section of Switch-house.

The arrangement of the original switchgear was very defective. There were no barriers between the different sets of apparatus, so that any arcing which might accidentally occur, either in a switch, transformer, or isolating link, was most likely to spread to adjacent apparatus. The bus-bars were quite unprotected, and there was nothing either to prevent the attendant, who might have to enter the passage behind the switchgear, from touching any part, or to save him from

the attendant, who might have to enter the passage behind the switchgear, from touching any part, or to save him from falling into the gear.

The need was obvious, but the difficulty was to provide a remedy without interrupting the supply. In those switch-houses which, had any vacant space, new switchgear was erected at the end, and the circuits were changed over one at a time, so that as an old switch section was removed a new one could be built in its place. In other switch-houses an extension to the building had to be made before anything could be done. The whole change-over was a long process, but the result has well repaid the trouble.

In the majority of the switch-houses now in use the three bus-bars are catried in brick compartments at the top, and a separate brick cubicle is provided for each line of switch parts. The front slate panels are 2 ft. wide and contain an ammeter, an integrating watt-hour meter, and the switch control lever with its overload trip coil.

The latest form of switch-house is built parallel to the substation, and fig. 7 shows the design of switchgear employed. The cubicle arrangement has been developed to provide isolated sections for the different parts of the gear, so as to limit the result of any accident as far as possible. The cubicles are made of reinforced concrete. The new arrangement requires more space, but as the security of the whole supply depends upon the reliability of the switchgear, the little extra expense is thoroughly warranted.

The oil switches first used had been provided merely on a current-carrying basis for the full load of the circuit which they were to control. This is a very common but most erroneous practice, because it is so often forgotten that an automatic switch should be able to open the circuit with safety to itself under the worst conditions, which will probably be a short-circuit on the cables just beyond it. Frequent switch failures naturally followed. The rules now are: (a) that all oil switches in a switch-house shall be of the same size, (b) that such switches shall be rated for a current of 800 amperes at 15,000 volts, and (c) that no difference shall be made between the equipment of cubicles for 2,100-volt and 525-volt circuits, except in the current transformers and the meters. Since the above practice was instituted, trouble in switch-houses has practically disappeared.

Three-core, lead-covered and armoured cables, laid in trenches, are universally used between the main switch-house and the various sub-distribution points on each mine. The

trenches, are universally used between the main switch-house and the various sub-distribution points on each mine. The points are arranged to suit the local conditions, and are generally interconnected so that the failure of any main cable does not stop the supply. Link cages, without switches, are provided at the sub-points, so that the sub-circuits can be isolated at any time and the feeders interconnected as may be required. The largest cable used is of 0.5 sq. in. section per phase, and a separate panel for each feeder cable is provided in the switch-house. Where necessary several cables are run from the switch-house to individual link cages, and are operated in parallel.

are run from the switch-house to manner are operated in parallel.

Many and varied troubles have been experienced since the beginning of the power supply, quite apart from those which can be laid to the charge of the power company. They have been very costly in some cases and very annoying in all, and every one could have been avoided. The troubles have arisen from two main causes: (a) faults in design, and (b) faults in manufacture.

(a) Faults in design.—Want of stiffness in the stator frame has been found both in low-speed direct-coupled motors and in geared motors. The fault is a most serious one, and the

remedy is obvious.

remedy is obvious.

Some makers secure the stator core stampings by means of dovetailed strips screwed to the inside face of the frame. This is not nearly such good practice as to machine dovetailed slots out of the solid metal of the frame, into which the dovetailed projections of the stampings fit, as there is always the risk of the screwed strips getting loose under the severe racking strains to which the stator of a winding motor is always subject. subject.

A number of 3-phase winding motors were supplied in which the dovetailed strips were "secured" by means of studs with nuts on the outside of the frame within the housing. No lock nuts or even spring washers were provided, and as the practice of the makers was to adjust the air-gap by means of the studs, the results can be imagined.

studs, the results can be imagined.

In motors by the same maker, the stator and rotor coreplates were clamped sideways by bolts passing right through, and the nuts were entirely hidden by the end loops of the coils. One motor was delivered in which the width of the stator core was 18\frac{3}{2} in. on one side and only 18 in. on the opposite side, while the corresponding dimensions of the rotor core were 18\frac{1}{2} in. and 17\frac{1}{2} in. It was impossible to get at the nuts to tighten up the core-plates without first removing the windings. The proper way to secure core-plates sideways is to clamp them between stiff end plates and to use circumferential locking keys. ferential locking keys.

Cases were found in which the dovetailed slots were so wide that packing strips had been inserted to keep the core-plates from shaking. When complaints were made the maker asserted that it was not possible to machine so accurately as

to avoid the use of such packings!

to avoid the use of such packings!

It is the practice of some makers to make semi-enclosed winding slots in the core plates by first punching a closed slot and then, when the whole core has been clamped up, to cut through the periphery of the core at the top of each slot by means of a saw. Quite a number of motors have been made in this way, and it was found that the result of the sawcutting was to spring out the tips of the teeth on each side of each ventilating space, so that the spaces were almost closed of each ventilating space, so that the spaces were almost closed in many cases. It was only by taking out the rotor that the fault could be seen. The correct way to make semi-open slots is to punch them out at one operation.

Difficulties were experienced in many cases from the type Official times the spaces and, instead of remaining firmly at right and so to the spaces and restaured process. The spaces in the stator and rotor cores. This was a plain, thin steel strip, placed radially on edge and secured to one of the adjacent core-plates by simple riveting. The necessary pressure used in clamping up the core-plates was too much for many of the distance pieces and, instead of remaining firmly at right and so to the spaces they bent over and partially collapsed. the distance pieces and, instead of remaining firmly at right angles to the spaces, they bent over and partially collapsed. The area of contact between the edge of the strip and the face of the plate was in most cases found to be too small to take the pressure, and particularly where the core teeth were wide the teeth at the ventilating spaces were badly bent. Distance pieces of I section which are stiff and have a good bearing face on each side are now insisted on for all motors, and they should be spot-welded to at least one of the adjacent core-plates. They are easily obtained, as instanced by the fact that some makers never use any other form, but from the objections raised by other firms one would think their provision was not only impossible but also meant bad practice. practice.

With a view to produce a 3-phase motor with a very high With a view to produce a 3-phase motor with a very high power factor, it is the almost universal custom to make the air-gap exceedingly small, and in many cases this is carried to excess. Instances of rotors of 6 ft. diameter with a radial air-gap of only 1 mm, are not unknown on the Rand, and when such motors also have stator frames which will not retain their shape without external struts, the matter becomes very serious from the operating point of view. Bearings will wear, and rotors and stators comptimes get out of truth; and wear, and rotors and stators sometimes get out of truth; and it does not take very much in some cases to let the rotor down on to the stator. Then the customer blesses the motor

down on to the stator. Then the customer presses the maker.

A minimum radial air-gap = square root of rotor diam in mm./20 - 0.25 in. mm. is now demanded for all moderate-speed motors, and manufacturing errors are not accepted.

A serious fault with many 3-phase winding motors is in the sizes of the rotor slip-rings and brushes. Contact areas which are large enough for motors in which the slip-rings are short-circuited and the brushes lifted as soon as full speed is reached, may be, and frequently are, quite insufficient when the brushes and rings are in use the whole time. A current density of not more than 60 amperes per square inch should be the maximum for carbon brushes.

density of not more than 60 amperes per square inch should be the maximum for carbon brushes.

A similar fault is to be found in the motors and generators of some Ward Leonard winders, and in this case the R.M.S. rating is not the controlling factor. The brush area should be based on the maximum current passing on accelerating the winder, which current is frequently twice the normal.

That slipzing short-eigeniting arrangements are generally

winder, which current is frequently twice the normal. That slip-ring short-circuiting arrangements are generally very defective has already been mentioned. It would appear to be a difficult matter to design them so that a large area of contact can be provided in the space usually available, and so that the sliding collar which carries the contacts can be accurately centred and held free from shake and side movement when the brushes are lifted. A great deal of the difficulty would, however, be removed if the slip-rings were made only a few inches larger in diameter. The fact that the peripheral speed would be increased would be of no consequence, as the brushes are lifted at full speed. Flimsiness of design is the usual characteristic of 3-phase motor brush-gear.

The rating of oil switches was referred to in dealing with The rating of oil switches was referred to in dealing with the switch-house arrangements. Is it too much to ask of makers of switchgar that they will rate their oil switches, not only at the maximum currents which these switches will safely carry continuously, but also at the maximum kilowatts at which they will safely break the circuit under normal voltage? They would probably burn up a few switches in obtaining the information, but they would then be in a position to supply apparatus which would really stand up to the conditions of actual service.

A fault in the design of some motors which have end-shield

A fault in the design of some motors which have end-shield bearings is that the oiling ring is placed in a position where it can neither be seen nor reached.

Perhaps the most important point in connection with the design of motors and generators is that of the safe maximum working temperature. The altitude of the Witwatersrand is about 6.000 ft. (barometer 24.5 in.) above sea-level, and as the reiteration of that fact in hundreds of inquiries for plant seemed to have no meaning for some makers, recent specifica-tions have had to call for a maximum temperature under test at sea-level which would give a safe working temperature at

the nimes.

The clause provides that no part of the motor, when working continuously at full load at sea-level, shall have a temperature rise exceeding 30° C., with the surrounding air at a temperature of 25° C. This corresponds approximately to a temperature rise of 35° C, at an altitude of 6,000 ft., with a surrounding air temperature of 35° C., or a total temperature of 70° C. (158° F.), which is quite high enough for any machine to work at continuously if a long life is to be obtained.

As the supply voltage can, and frequently does. As the supply cottage and the lowest supply pressure must be taken for the purpose of

the test.

The Engineering Standards Committee recently proposed that "a machine intended to operate between two limits of that "a machine intended to operate between two limits of rated pressure shall have its rated current determined at the higher pressure." This would be fatal for motors intended for the Witwatersrand, or any other place where the supply pressure has considerable variations, as they must be able to work continuously with the larger current which is entailed by the lower voltage limit.

The great objection which most makers put forward to a lower temperature limit is that it would increase the cost of the motor, or it would mean the use of a larger frame, or any other reason which they can find to avoid giving the pur-

any other reason which they can find to avoid giving the pur-chaser what the latter requires. Unless the customer insists chaser what the latter requires. Unless the customer insists on his requirements being met, the great competition between on his requirements being met, the great connectition between various makers will probably result in machines being supplied which are cut finer and finer every time. It is, of course, always assumed that the purchaser has an intelligent knowledge of his requirements, and that they are always reasonable. As an instance of the extent to which some firms will go in under-cutting, the representative of a very well-known firm once remarked to the author, relative to the sizes of the motors kept in stock by that firm, "Output plates are cheap."

Some manufacturers have not vet learned the important lesson, that in order to succeed they must be prepared to

supply what the customer wants and in the manner that the customer wants it, and not try to prove to the customer that he does not want what he wants, but what the manufacturers make. As a matter of fact few manufacturers make any real attempt to find the requirements of any particular market, and a still smaller number make any real attempt to meet such requirements. Then they express surprise when the market

(b) Faults in manufacture.—For faults in design there may be the slight excuse that the designer is limited in his experience of the particular duty that will be required of the plant which he is designing. For faults in manufacture there can be none. What then can be said of the under-mentioned list, the items of which are a few of many that have come under the personal knowledge of the author during the last four years, and all of which occurred in the work of firms of worldwide repute? wide repute?

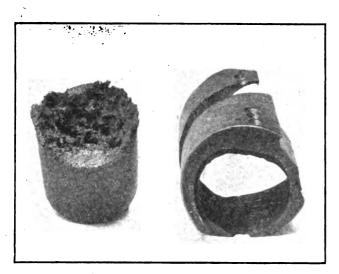

FIG. 8.—Broken Shaft and Broken Brake Pin.

In one case the several sections of a cast-iron bedplate of an electric winder would not fit together, even by persuasion, although the maker seriously stated that they had been perfectly fitted in his shops. Doubtless the higher temperature and relative dryness of the atmosphere on the Rand had something to do with it.

The shaft of a 100-H.P. motor, driving a tube mill, broke off just outside the coupling. The method of manufacture can only be guessed at from the right-hand object in fig. 8. The shaft had layers just like an onion, and these layers had apparently been wound on sprally and then welded together.

apparently been wound on spirally and then welded together.

A steel pin, 3 in. diameter, supplied for part of the brake gear of an electric winder, showed one or two surface flaws when inspected on delivery. A slight blow with a hammer broke the pin in halves, with the result shown in the left-hand object in fig. 8. It proved to be made of cast-steel instead of forged steel, with a blowhole covering almost the full diameter. When it is remembered that men's lives would in all probability have been lost when the brakes had been applied a few times, some idea of the seriousness of the case will be obtained.

The instance of the 3-phase winding motor in which the

will be obtained.

The instance of the 3-phase winding motor in which the dovetails were adjusted from outside has been mentioned. As no spring washers were supplied an attempt was made to make the nuts more secure by using them, and, for this purpose, the nuts were removed one at a time. On taking off one of the nuts the bolt end came away with it, and on examination it was found that the original bolt was only projecting through the stator frame for a depth of about two threads. A short bolt end had been screwed into the top of the nut to make it appear sound from the outside. There could be no mistake, as the two abutting ends did not in any way match. way match.

Trouble had been experienced with the stator coils of some 3-phase, 2,000-volt winding motors, and the external taping of some of the end loops was removed. It was found that the slots were only three-quarters filled with wires, the rest of the space being empty. To make it appear that everything was all right, pieces of tape had been carefully screwed up and pushed for a short distance into the slots. These pieces were gradually tapered off where they followed the coil out, so that the external wrapping of tape gave a smooth finish right up to the core. Every other motor of the same size and make was then examined and found to be in a similar condition. It cost the maker a considerable sum to make the motors even passably right. passably right.

All stator coils for 2,000-volt motors are now required to be either semi- or completely-former wound, and to fill the slots completely.

The most costly trouble to either of the mines was the case of the breakdown of the motors of two large Ward Leonard winders, which failed from the same cause within a few hours of each other, and completely shut down a large shaft

for four or five days. The spaces between the turns of the main-circuit coils on the auxiliary field poles had been filled up with some kind of pitch, and the whole was taped over. The armatures had open slots without wedges, and the coils were held down by a number of steel-wire bands. These bands broke away on two of the motors, some of the coils came out, and very bad breakdowns resulted.

when the top halves of the field magnet-systems were removed, lumps of hard pitch were noticed on the faces of the auxiliary poles, and these showed heavy scoring marks where they had rubbed on the armature bands. An examination of what was left of the bands showed that the first layer had been rubbed right through in some places. There could be no doubt that the pitch inside the coils had melted and run down, that it had set hard during the night and that when the winders were started up in the morning the wearing of the bands began. A further examination showed the original source of the trouble. The external connections between the auxiliary pole coils had been carefully taped up by the maker before the motors were delivered. They were found to have been made as shown at the top of fig. 9. The windings consisted of four copper tapes in parallel, and the cross-connections from pole to pole were made up from similar tapes. Each set of four had been bunched together, one set was laid on the other with a copper plate at the top and bottom, and four ocuntersunk-headed screws, \(\frac{1}{2}\) in. in diameter, were used

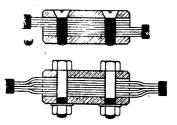

Fig. 9.—Connections on Winding Motor.

to draw the parts together by a screwdriver. The surfaces of the tapes had been left dirty, the burrs made by the drilling had not been removed, and a number of the screws were found melted off. As the current was frequently as high as 5,000 amperes, this is not to be wondered at. The heat at the contacts had evidently made the whole coil so hot that the pitch had melted out and the breakdown quickly followed. The remedy was a simple one. The faces of the individual tapes were carefully cleaned and then interlaced as shown at the bottom of fig. 9. Hexagon-headed bolts and nuts instead of screws enabled a heavy pressure to be applied, and the joints now run quite cool. and the joints now run quite cool.

Many other instances of bad work could be cited, but the above examples are characteristic and serve to show what even big firms will sometimes do if they are not carefully watched.

## INSTITUTION OF ELECTRICAL ENGINEERS.

## ANNUAL REPORT.

THE annual report of the Council, to be presented to the general meeting of the Institution on May 27th, has been published in the Journal, and states that at May 1st the membership amounted to 6,811 of all ranks, a decrease of 234 during the year. New members elected numbered 171, mainly students and graduates, and 16 were reinstated; 54 died, 123 resigned, and 244 (including 129 students) lapsed. Sixty candidates for Associate Membership have been approved subject dates for Associate Membership have been approved subject to their passing the examination.

Military distinctions have been conferred upon Brigadier-General A. M. Stuart, C.B., R.E., Commander E. G. Robinson, R.N., and Second-Lieutenant G. W. Williamson, for their services during the war.

their services during the war.

Three past-presidents have died during the year, namely: Prof. W. Grylls Adams, Mr. R. Kaye Gray, and Sir Joseph Wilson Swan. Seven members have died on active service, namely: Sapper J. A. Donald, Henry Labour, Major H. H. S. Marsh, Sec.-Lieut. J. L. Moffet, Sapper W. W. Pullen, Captain Guy L. Sclater, and Sec.-Lieut. Eric W. Wilson.

Premiums have been awarded as follows:—Mr. C. J. Beaver, Institution Premium; Mr. J. H. Rider, Ayrton Premium; Mr. H. G. Brown, Fahie Premium; Mr. E. B. Wedmore, John Hopkinson Premium; Dr. S. P. Smith and Mr. R. S. H. Boulding, Kelvin Premium; Mr. C. P. Sparks, Paris Premium; Messrs. W. M. Selvey and N. Shuttleworth, Extra Premium; and Students' Premiums to Messrs. H. Hobson, A. Arnold, and H. S. Marquand. Salomons Scholarships have been awarded to Messrs. L. M. Barlow and C. D. Farmer, and a David Hughes Scholarship to Mr. P. D. Morgan.

A revision of the Wiring Rules is in progress. Over 2,500

A revision of the Wiring Rules is in progress. Over 2,500 copies of the revised Model Conditions for Contracts have been

disposed of. The Research Committee has made further progress, and interim reports have been published in the Journal on the heating of buried cables and the properties of insulating oils. The effective steps taken by the Council to assist the authorities are described, and it is stated that 928 members are serving in the Navy or the Army. The appointment of a committee to deal with the expansion of British trade is explained, in a passage which we reproduce in our leading -columns.

A committee appointed to consider the periods of repayment allowed by the Local Government Board for loans to municipal authorities has recommended periods of 30 years in the case of underground cables, 60 years for conduits, 15 years for batteries, and 30 years for reinforced concrete, and the Council will make representations to the Board on these lines.

The Committee of Management of the Benevolent Fund reports that the capital account of the fund stood at £4,642 at the end of 1914. In response to a special appeal by the President, £318 has since been raised.

The annual accounts show an excess of income over expendi-

The annual accounts show an excess of income over expenditure of £1,624, compared with £2,833 in 1913. Mortgages have been reduced by £710 and now stand at £34,232, and the balance of assets over, liabilities stands at £71,570, compared with £69,523 in 1913, an improvement of £2,047. There are now 11,085 volumes in the Library; there were 1,585 readers during the year, and 602 books were issued from the lending library. library.

Practical Aspects of Visibility.—In opening a discussion on this subject at a recent meeting of the ILLUMINATING Engineering Society, Messes. C. C. Paterson and B. P. DUDDING communicated the result of inquiries into conditions which, in some practical cases, prevent good visibility. The more interesting of the cases considered were: (1) The visibility of distant lights at night. (2) The visibility of objects illuminated by the beam of a searchlight or motor headlight. (3) The visibility of objects in close proximity to bright lights. (4) The relative visibility of objects by direct and indirect light. The question of visibility as distinct from invisibility is frequently bound up with the behaviour of the eye on the "threshold of vision." A variety of unusual factors exert their influence under very faint illumination, and, in such cases as the above, they are of great practical importance.

Sailors and railwaymen are concerned with the visibility at night of very small point sources of light. White masthead lights carried by steamers are supposed to be visible at 5 miles, and the red and green side lights have to be visible at 2 miles, which is about the limit attainable by oil burners; electric lighting is now common even on tramp steamers, and is subject to no such limitation. On an ordinary clear dark night, 1'6 c.P. is visible at 2 nauts, atmospheric absorption is unimportant and the inverse square law holds good. The intrinsic brilliancy of the source has no effect on its visibility. It is only the total flux of light that counts, until the source becomes so large or near that it subtends more than one minute of arc at the eye. The energy received per second from 1.6 c.P. at two miles is about  $6 \times 10^{-15}$  watt, and it is possible to stimulate vision with one-fourth of this power when the eyes are dark adapted.

In connection with motor headlamps and searchlights, if an object be visible at a certain distance under one illumination, more object be visible at a certain distance under the finding that the four times that illumination is needed to make it visible at twice the distance, because the object itself then appears much smaller. From a series of interesting investigations, Messrs. Paterson and Dudding find that brightness for equal visibility must be proportional to the square of the distance from the observer so long as the object subtends less than 10 are (1 ft. at 100 meda), but for object subtends less than 10 are (1 ft. at 100 meda), but for object subtends less than 10 are only the law observer so long as the object subtends less than 10 arc (11t. at 100 yards); but for objects subtending a larger angle, the law suddenly changes and brightness for equal visibility is simply proportional to distance. This result, which does not accord with usual assumptions, appears to be well established by the authors' tests, and a reasonable theoretical explanation for it was advanced by Dr. Chalmers in the discussion. Probably for long-distance searchlight work 16 times the intensity is required to render objects visible at twice the distance. objects visible at twice the distance.

It is interesting to note that under very severe conditions of glare"—looking from a distance of 6 ft. at a point only 8 in. from a bare 20-C.P. lamp—no appreciable effect whatever was produced on ability to discriminate detail, so long as the equivalent surface brightness of the object was not less than 1 ft. candle. These results do not affect the undesirability of glaring lights from other points of view, but indicate that glare has little effect on visibility of detail under ordinary conditions of lighting.

In conclusion, the authors pointed out that discrimination of detail on textile and other materials of uniform colour depends entirely on shadow, or the direction of incident light, so that indirect lighting is practically worthless in this respect. For discrimination of detail, and to avoid a monotonous effect, indirect lighting needs "helping out" by direct lighting.

#### THE **SMITHY** BRIDGE RAILWAY COLLISION.

THE report of Lieut.-Colonel Druitt on the collision on the Lancashire and Yorkshire Railway at Smithy Bridge on March 18th shows that, whilst the accident was generally similar to that at Ilford on January 1st, it yet had some features in which it differed from the earlier occurrence. The collision was, fortunately, not attended by so great a loss of life as that at Ilford, but one of those killed was the driver of the express, who seems to have been responsible for the disaster.

The collision took place during a snowstorm, as to the intensity of which, and the necessity for change of procedure in signalling operations, there seems at the time to have been some diversity of opinion amongst those engaged in working the traffic. The evidence given at the inquiry covers the working over four block sections and some of the operations at another, and clearly brings out several interesting points—not necessarily for the first time.

The train which was run into was an empty stock train, which had been standing at Smithy Bridge East box for over twenty minutes at the time of the collision. The fireman had complied with the regulation which required him to proceed to the signal box. The driver and fireman of this train both said they had difficulty in seeing the signals when approaching the point at which the train ultimately stopped. The light of one signal could not be seen on account of the spectacle being blocked with snow, and that signal was treated as at danger. Much of the difficulty in seeing the signals was due to the engine cab windows being covered with snow, which necessitated looking outside the cab to see the signals.

The first evidence with regard to the express, in the order of the progress of the train, is that of the guard in charge, who stated that he noticed the outer distant signal for Summit West was off when he passed it. The signalman at Summit West box said there was some delay in accepting the train by Littleborough Station, and that the express passed his box before he could remove his hand from the lever operating the outer distant signal. He was of the opinion from the speed at which the train was travelling that it would have passed all his signals at danger, had he not lowered them immediately before the train passed them. This signalman also stated that the windows of his box on the side from which the train was approaching were covered The outer distant, however, is some distance inside the tunnel and not, therefore, affected by the snow.

The fireman of the express stated that he saw the home signal for this box, and that it was off.

The signalman at Littleborough Station stated that the express passed through the section controlled by this box with the signals all off, but that he noticed that the distant signals for the box in advance (Littleborough West) were at danger, and he was so impressed by the speed of the train that he called the attention of the signalman in advance, and told him he thought the express was going to run past the latter's stop signals.

[749]

The fireman of the express stated that he advised the driver that the Littleborough Station distant was off, and the driver answered: "Right."

The express did pass the stop signals at danger at Little-borough West, and continued into the next section. The signalman at that box had a special lever for placing a detonator on the line run over by the express, but did not use it. He admitted that it "would have been better" if he had placed the detonator on the line when the section ahead was blocked, and if he had used "fog block," it would have added to the safety of the working.

The next direct evidence is again that of the fireman, who said: "I.... had just finished firing when my mate shut the regulator and applied the brake, but did not say anything to me." "My driver appeared to be all right and had not shown any signs of illness. I think he was looking out over the side of the cab before the collision occurred.... The windows of the cab were snowed over, and when I observed the signals I was looking outside the cab."

Here we have a number of conditions contributing to the accident, and some of them in more ways than one. A snowstorm of some magnitude blocks the line with traffic between certain places. A train is held up at a place already so choked with traffic that it is impossible to get the train off the main line. Some of the signalmen fail to realise all the conditions, and do not bring into operation the modifications of block working which are intended to meet the conditions set up by the snowstorm, and one of them fails, although specially warned, to actuate emergency mechanism, provided to deal with overrunning. The driver of the train following that which has been brought to a stand overruns all the signals in one section and the non-stop signals of the section occupied by the standing train, with the known results.

Three points seem to stand out clearly from this short recital of the circumstances in the order of their occurrence. The first is that the value of any apparatus provided for manual operation in cases of emergency depends entirely upon the readiness with which the circumstances are grasped by the operator. The second is that it seems undesirable to leave the initiative for bringing modifications of operation into use in the hands of those whose instructions for the purpose are dependent upon their local conditions. The third is the necessity for further information being afforded to the driver under such conditions as obtained in this case.

The first point relates to the emergency detonator placer at Littleborough West, which is said to be one of a large In this case infrequency of use had number installed. apparently a good deal to do with the failure to operate it when such operation would have been of peculiar value. The second point refers to the conditions under which signalmen are to commence fog-block working and to call out fogsignalmen. Fog signalmen are called out when the signalman cannot see, or has difficulty in seeing, some designated "object" in his neighbourhood from his box. The degree of clearness with which the signalman can see his "object," and upon which he must decide upon the need for fog-signalmen, is obviously a matter personal to individual signalmen, and is governed, moreover, by local conditions. But this measure of visibility tells the signalman nothing with regard to the effects of the storm on the driver of an approaching train, such as the covering of the engine-cab windows, as in this case, nor does it tell him anything with regard to the obscuring of the lights of signals on the indicating side of those signals which lie in the direction from which trains approach his box. After all, it is the effects in so far as they relate to the driver that

On the third point it seems hardly necessary to enlarge. There are few who at this date will not concede that the driver's duties are of too onerous a character under such conditions, without means of ascertaining the positions of signals in addition to that of direct vision. The evidence of the driver and fireman of the stock train and that of the fireman of the express shows clearly the difficulties experienced in sighting the signals. The evidence goes to show that the express driver's condition was normal. What

caused him to pay no observance to the signals exhibited in the comparatively short run necessary to bring about the collision will never be known, but the lesson—one of many of the same class—is clear.

Colonel Druitt concludes the report in much the same terms as Colonel von Donop concluded the report on the Ilford collision. Both would seem to be content with "an unmistakable warning as to the position of the distant signal." Both refer to other railway companies (not by name) which have already made trials of devices designed for this purpose, and the further remarks are only diversified because the L. and Y. Co. have made experiments with "more than one kind for warning drivers when passing distant signals," and the Great Eastern have not. One is led to infer from the almost identical phrasing of the concluding paragraphs of the two reports that the Inspectors have come to an agreement with regard to the requirements. But surely the paragraphs quoted do not represent all that the Inspectors consider necessary?

THE frightful disaster which took place "Lest we near Carlisle on Saturday last, far Forget." surpassing in magnitude and horror any railway accident previously recorded in Europe or America, has sent a thrill of grief and dismay throughout the nation. The saddest feature of the accident is the fact that not only its appalling accompaniments, but also its very occurrence might have been prevented. The use of electric signals giving warning to the driver of the troop train of the presence of the local train on the up line would have enabled him to stop in time, and as our pages have fully shown, the only question is not whether there is a practical system of track-circuiting available, but which of the various systems extant is the best. As for the burning of the trains, there is only too much reason to believe that it was due to the use of gas on two at least of the three trains that were involved. We almost despair of arousing the British public to the realisation of the dangers of this practice. We have constantly dwelt upon the terrible risk incurred by it, though abused by the organs of the gas industry and mocked at by our electrical contemporaries, and we have urged that the bitter lessons taught us from time to time should not be forgotten, but should be taken to heart and acted upon. Unfortunately the public has a short memory, and after a few days' agitation takes up some other sensation. We fear that the war news will occupy its mind to the exclusion of all else, and that the railway authorities will be permitted as usual to ignore the teachings of the past.

Municipal suggested that the arbitration clauses Contracts: contained in the conditions of contract Architect v. framed by the Royal Victorian Institute Engineer. of Architects should be inserted in all contracts to be entered into by the Council to which such clauses would apply. The notice of motion rightly brought a communication from the Victorian Institute of Engineers pointing out several important things. First, it was asserted that by far the greater proportion of the Council's contracts related to matters of civil, mechanical, and electrical engineering. Next, that a large proportion of the items of building contracts also related to engineering issues in respect of steel and reinforced concrete construction. Lastly, and by no means least important, it was remarked that the conditions of contract of the Royal Victorian Institute of Architects required that arbitrators should be members of that Institute. The engineering profession not unnaturally protested against any attempt to prevent its members from acting in a capacity in which it had previously been recognised that they may fell a mitted it had previously been recognised that they were fully entitled to act. Objection was with equal justice raised on the

Arbitration in discussed a motion in which it was

THE Melbourne City Council recently

ground that the motion, if passed, would make no provision whatever for arbitration in respect of a large class of work concerning which engineers alone were competent to In the course of the City Council discussion it transpired that the Master Builders' Association had resolved not to tender for any of the Council's contracts unless there was an independent arbitrator to appeal to, and the suggestion referred to in the motion was based on the belief that members of the Institute of Architects had had the largest experience of arbitration matters. That an independent arbitrator should be appointed is altogether the correct thing—we have advocated it in season and out of season for many years—but to imagine that because an architect is a member of a certain Institute he is therefore fully qualified to arbitrate upon more or less extensive engineering operations is, from the engineering point of view at any rate, little short of ludicrous. We should more readily regard a highly qualified professional engineer as being by training and experience fitted to arbitrate in regard to the contracts concerning which the architect had been acting. the original proposal appears to have been brought forward with the most innocent of motives, under pressure of the Builders' Association, as competitive tenders could not be obtained without independent arbitration being secured, and the points advanced by the Victorian Institute of Engineers had seemingly not been foreseen. The upshot of the matter was the withdrawal of the original motion and the substitution of an amendment which would avoid the principle proposed being applied to every department dealing The amendment which was agreed to conwith contracts. tented itself with requesting the Legislative Committee of the Council to revise the conditions of contract, with the special object of providing for an arbitration clause. There the matter ends for the present, but the incident shows how necessary it is for engineering organisations to be on the alert, watching for opportunities to safeguard the interests of their members, and how timely interventions to that end may be successful in preventing undigested and misunderstood propositions from being adopted which, if permitted to pass, could only lead to a state of things most unsatisfactory for engineering contractors, and derogatory to the best interests of professional engineers.

THERE have been heavy arrivals of lead Lead. during recent weeks, the total imports during April being 23,400 tons, making a total of about 81,000 tons compared with about 77,000 tons last year. There has been a large increase from Spain, nearly 5,000 tons, while the United States is 9,600 tons up, but the imports from Australia show a decrease of about 6,000 tons, and those from other countries of about 4,000 tons. sumers in England, at all events, do not care much about American lead, and there have been a considerable number of complaints regarding some of the metal which has been delivered on the London market. It is generally com-plained that the metal does not roll well, and is not sufficiently pure to please the corroders, hence the general dissatisfaction which has been voiced in connection with deliveries of lead designed for use in these particular This has accounted for an increased demand for Spanish and Australian brands, and as much as 10s. a ton premium has been paid for some of these during the past week or so.

There has been a moderate inquiry experienced in all directions, but the general consuming trade is admittedly rather quiet. There is still considerable faith felt in the development of large demands for the Allies, but, so far, they have not reached an important level just lately, though it is thought the indications point to an improvement before long. America has rather been holding back from the market lately, in consequence, no doubt, of the fall in prices which has been sustained, but an advance in London would, no doubt, induce sellers to come forward with much more freedom.

There will probably be no material increase in the world's production of lead in the near future, and if this proves to be the case, demands may be fully able to take care of the supplies. Many people, indeed, think it possible that the whole of the available material may be swept up by consumers before long, and if this should be the case, an advance in prices would be inevitable.

WE suppose there are few words of "When in foreign trade counsel that have been so Rome -." frequently reiterated in the ears of the British manufacturer as those which urge the necessity for studying the peculiar characteristics of markets in which our foreign competitors have been successful, and we have not. Sometimes it has seemed to be little short of a heinous offence to dare to say such things. Yet that such advice has not been proffered without abundant justification is being proved in many directions in these days of war. It is true that most of our engineering factories are engaged to the extent of a considerable percentage of their productive capacity upon war requirements, but it is equally true, as the Chancellor of the Exchequer has so recently told us, that it is of vital financial importance to the nation that we maintain our exporting activities. The great volume of our trade must be kept flowing as far as labour and transport and shipping facilities will permit. The amount of business actually available is large, and it is to be hoped that we shall be able to cope with it notwithstanding the increasing calls for recruits for the fighting line. But the fact that there is business doing does not allow us to shut our eyes to the need for preparations for the future. We have said so much on this matter that we hardly like to touch it again so soon, but it is imperative that we should give heed to these oft-repeated words of counsel, which are now being used by those who are anxious to do-business with us. We have secured for ourselves an unenviable reputation in too many countries for assuming a high and mighty independent attitude toward those with whom we affect to desire to open business connections. We are prepared to offer for sale the things that we make but are charged with being too ready to turn down requests for articles that are out of our usual run of manufactures—things that in many cases might well be made in British factories. We believe that that habit is changing, and that it will have to undergo further development in the coming days. But for some markets, perhaps, that "take it or leave it attitude" has not been so serious an obstacle to our success as our failure to understand the people with whom we desire to trade, and their systems of doing business.

In Russia, we read, British trading authorities have been dwelling upon the necessity for our traders adapting

themselves to the system of credit that obtains there. is, of course, not a new point, but it is one of prime

One of these authorities says that English people have not hesitated to confess their ignorance of the Russian system, and to admit that in that ignorance lay the reason of their inability to comply with many of the requirements of Russian commercial men. Long credit and easy credit are stated to be essential, and German firms have noted that circumstance, and by meeting the position strengthened their hold. "The Teutons had a whole army of commis voyageurs who captured hosts of clients by studying the customs of Russian traders and conforming with the credit M. Timiriazeff, whose name is quite familiar to our trade readers, says (Financial Times): "I am certainly not one who states that all is good in our Russian methods, but still I must say that the most dangerous competitors of Great Britain, the Germans, always understood how to adapt themselves to existing conditions, and as a consequence they got together an important trade." have frequently shown how German firms have practically flooded with commercial travellers, efficiently trained and capable men, markets which we have left to the care of a handful of men. It is easy to see that our rivals have been better able to meet the requirements of markets when their numerous representatives have so thoroughly studied the people, their systems and their general conditions. The warning may be familiar, but it is none the less necessary and none the less timely on that account.

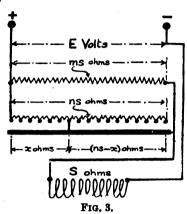

# SOME NOTES ON SHUNT REGULATING RESISTANCES.

## BY THOMAS CARTER

## (Continued from page 717.)

II. Regulators with Protective Resistances.—These are used probably less frequently than potentiometer regulators, but they are equally interesting from a theoretical point of view, and are capable of a similar general treatment in terms of E/s and multiples of s.

The standard connections of a regulator of this type are shown in fig. 3.

The exciting voltage, E, has across it the field winding, whose resistance is s, in series with a loop consisting of the protective resistance, m s, in parallel with x, which is part of the regulator, n s.

The total resistance between terminals is-

$$s + \frac{m s q n s}{m s + q n s}$$

 $= s \cdot q \, n / (m + q \, n) \cdot (m + 1 + m / q \, n).$ 

The total current in the circuit, which is the current in s, i.e., the field current, is—

E/s. (m+qn)/qn. 1/(m+1+m/qn). The current in x is ms/(ms+x) = m/(m+qn) of the total current, and the current in ms is x/(ms+x) = qn/(m+qn) of the total, so that—

$$\frac{E}{s} \cdot \frac{m}{q n} \cdot \frac{1}{m+1+m|q n|} \text{ is the current in } x,$$

and 
$$\frac{E}{s}$$
 .  $\frac{1}{m+1+m|q|n}$  is the current in  $m s$ .

A tabular statement can now be made as follows, showing the varying values of the currents in the three parts of the circuit, with m and n as yet indeterminate, for values of x from zero to n s, i.e., for values of y from zero to unity.

= q n s.	Current in ms (protective resistance)	Current in z (regulator).	Current in s = field current.
2 ms 3 ns 4 ns 5 ns 6 ns 7 ns 8 ns	$  F s. \ 1/(m+1+m/2n) $ $  E s. \ 1/(m+1+m/3n) $ $  I s. \ 1/(m+1+m/4n) $ $  I s. \ 1/(m+1+m/5n) $ $  E s. \ 1/(m+1+m/6n) $ $  I s. \ 1/(m+1+m/7n) $ $  I s. \ 1/(m+1+m/7n) $ $  I s. \ 1/(m+1+m/9n) $	E s. m '2n(m+1+m '2n)   B s. m '3n(m+1+m '3n)	E/s. $(m + 6n)/6n(m + 1 + m/6n)E/s$ . $(m + 7n)/7n(m + 1 + m/7n)E/s$ . $(m + 8n)/8n(m + 1 + m/8n)$

This type of regulator, in contrast to the potentiometer type, which is capable of giving zero field current, is useful in cases where the ratio of maximum to minimum values of shunt current is not abnormally great. Let this ratio be p. The value of p clearly depends on experimental data, and is not arbitrary. The values of m and n are, however, arbitrary, but they are connected with each other in a definite way, according to the value of p. For it is evident from the last column of the table that—

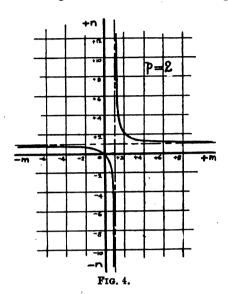

$$p = n/(m+1+m/n)/(m+n)$$
=  $(m n + n + m)/(m+n)$ ;
or,  $p - 1 = m n/(m+n)$ .

This can be transformed into-

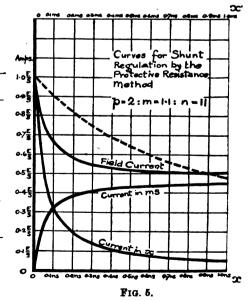

$${m-(p-1)}{n-(p-1)} = (p-1)^2,$$

which is a rectangular hyperbola, with asymptotes m = p - 1 and n = p - 1.

Just as the value of n was the starting point for the potentiometer regulator curves, so the value of p is the starting point for the curves for regulators with protective resistances; and a set of curves for various values of p, with possibly one or two different pairs of connected values of m and n for the same value of p, if found useful, may be drawn. Fig. 4 shows the curve connecting m and n

for the value p=2. The whole curve is drawn, including negative values, which are not usable for the present purpose, but are given to show the full shape of the curve. The asymptotes are m=1 and n=1, and the only part of the curve practically useful is the part close to the right of the vertical asymptote with values of m just over 10, and fairly high values of n. In other curves, the practically interesting part would be where m is just greater than p-1, whatever be the value of p. The reason for making m just greater than p-1 is to make it fulfil the condition that should the regulator become damaged, and its circuit be broken, the protective resistance will not reduce the field current much below its normal minimum value. The protective resistance is alone in series with the field winding under such circumstances, and if m is nearly equal to p-1,

the resistance between terminals becomes very nearly (p-1) s+s=p s, so that the field current is just under its usual minimum value, and there is no danger of an abnormal reduction of volts in a dynamo or increase of speed in a motor.

For the present case, (m-1)(n-1) = 1, or m - m - n = 0, or n = m/(m-1);

i.e., if m = 1.00 - 1.02 - 1.04 - 1.06 - 1.08 - 1.10, $n = \infty - 51 - 26 - 177 - 13.5 - 11.0.$ 

Choose the pair of values m = 1.1 and n = 11, and plot the curves shown in fig. 5, in which, as in Section I, ordinates represent currents in terms of E/s, and abscisse represent values of x for q=0 up to q=1.0. These curves are typical of the whole set which can be plotted for various values of p. Experience again will show the most suitable values of m and n for a given value of p; but the curves, once plotted, are of universal application, as has already been explained in the previous section. The determination of the current capacity and resistance of successive steps in the regulator is carried out on a similar principle to that already described for potentiometer regulators.

The higher values of p will occur in the case of motors with large speed ranges, and particularly in those with an appreciable amount of series winding on the field in addition to the shunt winding, it being necessary in certain cases to use compound-wound motors with a speed range of fairly large amount. After a certain value of p is reached, depending on the energy to be dealt with in the regulator, and other practical considerations, it becomes no longer suitable to use a regulator of this type or the ordinary type,

## THE PLIOTRON IN WIRELESS TELEGRAPHY AND TELEPHONY.

A further application of the thermionic current by the Research Laboratory of the General Electric Co., U.S.A., is described in the current issue of the General Electric Review, by Dr. Irving Langmuir, who, we believe, has conducted the researches on this subject.

After outlining the history and fundamental principles of the emission of electrons from heated metals in vacuo, and briefly describing the kenotron (see Elec. Rev., May 7th, 1915), the author states that in a pure electron discharge, as the temperature of the filament is raised, a point is always reached where the current becomes limited by the space charge between the electrodes. Under these conditions, only a small fraction of the electrons escaping from the cathode reach the anode, whereas the majority of them are repelled by the electrons in the space, and therefore return to and are absorbed by the cathode. From this viewpoint it is evident that if a negatively charged body is brought into the space between the anode and cathode, the number of electrons which then return to the cathode will increase, so that the current to the anode will decrease. On the other hand, if a positively charged body is brought near the cathode, it will largely neutralise the negative charges on the electrons in the space and will therefore allow a larger current to flow in the space and will therefore allow a larger current to flow from the cathode. In this way it is possible to control the current flowing between the anode and cathode by an electro-

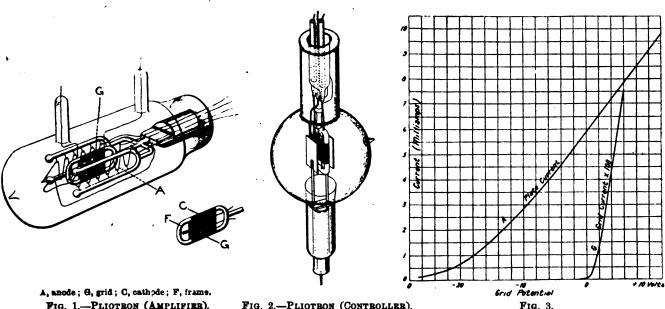

FIG. 1.—PLIOTBON (AMPLIFIER).

Fig. 2.—Plioteon (Controller).

Fig. 3.

and it is necessary to go over to the potentiometer type already described. No general rule is available for the correct point of change-over: experience, again, is the only guide.

If, as is indicated in the earlier article already referred to, the protective resistance has to be used for shunt regulation as an ordinary series type regulator in case of emergency, should the regulator become broken, the current it carries will be the whole field current, as there explained. The curve of field current in this case is quite different from the curve indicating normal conditions.' The latter is shown by a full line curve in fig. 5, plotted, as are the other two full-line curves, against the lower scale of x = 0 - 1.0 n s. The field current curve, and therefore also the curve of current in ms for the abnormal condition, is shown by a dotted line, and is plotted against the upper scale of x' = 0 - 1.0 m s, indicating the variation in current as more or less of ms is cut out in the special case under consideration. If, then, the protective resistance has to fulfil this emergency function, it must have a capacity equal to the dotted curve in its various sections, according to the way in which these can be temporarily short-circuited, and not merely equal to the maximum value indicated in the full-line curve. This shows the actual amount of the increase in size indicated in the earlier article. The dotted curve also clearly shows by how small an amount the minimum shunt current is reduced should the regulator be out of action.

(To be concluded.)

static potential on any body placed in proximity to the two electrodes. This controlling effect may be best attained by having this controlling member in the form of a fine wire mesh, or grid, placed between the electrodes.

The term "Pliotron" has been adopted to designate a kenotron in which a third electrode has been added for the purpose of controlling the current flouring between the current flouring between the controlling the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouring between the current flouri

The term "Pliotron" has been adopted to designate a kenotron in which a third electrode has been added for the purpose of controlling the current flowing between the anode and cathode. This word is derived from the Greek "pleion" signifying "more." A Pliotron is thus an "instrument for giving more" or an amplifier.

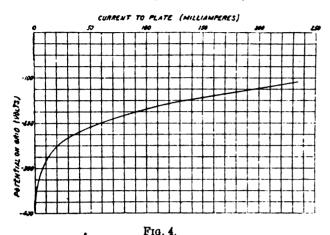

The three elements, hot filament cathode, grid, and anode, are, of course, similar to the elements of the De Forest audion. However, the operation of the audion is in many ways quite different from that of the pure electron device operating in the way described above.

In the audion, as well as in the Lieben-Reisz relay, the amplifying action appears to be largely dependent upon gas ionisation, even when the device operates well below the point at which blue glow occurs. The action is probably somewhat as follows: there is normally present a small amount of gas ionisation, due to the passage of the electrons between cathode and anode. The presence of the positive ions partly neutralises the space charge which limits the current flowing between the electrodes. If a small positive potential is applied to the grid, the velocity of the electrons passing by it is somewhat increased, and they therefore produce more ions in the gas. Besides this, as the potential on the grid is increased, the number of electrons passing the grid is increased, and this again tends to increase the amount of ionisation. A very slight increase in the amount of ionisation brought about in this way very greatly reduces the space charge, and therefore largely increases the current that can flow between the electrodes. Thus, with a given construction of grid, filament, and plate, the relaying action may be very greatly increased beyond that which would occur if no gas were present. The amount of gas ionisation which is necessary, in order to eliminate practically completely the

effects of space charge, is often much too small to produce a

visible glow in the gas.

If too much gas is present, or if the potential on the plate or the current flowing to the plate is too large, then the amount of positive ionisation may reach such values as almost entirely to neutralise the space charge and thus allow a large current to flow. Under these conditions, the relaying action of the audion is lost. This is the case, for example, when the audion gives a blue glow. In the border land between these two conditions, there is a region of instability in which the two conditions, there is a region of instability in which the

sensitiveness of the audion may be enormously great, but it is usually not found very practicable to operate the device in this region, because of the difficulties in maintaining adjustment, for any lack of adjustment may cause the audion to go over into a condition of blue glow.

The audion is often used with a condenser in series with the grid. Under these conditions, the audion requires the presence of a certain amount of gas ionisation so that the positive ions formed may prevent the accumulation of too large a negative potential on the grid. With the pliotron, owing to the absence of positive ions, if it is desired to use a condenser in series with the grid, this condenser must be shunted by a high resistance, and often a source of potential must be placed in series with the high resistance, in order to supply positive electricity to the grid as rapidly as this tends to be taken up from the electrons given oll by the filament.

In the construction of pliotrons, it has been found desirable to make the wires constituting the grid of as small cross-section as possible. In this way, even when a positive potential is applied to the grid, the current that flows to the grid may be made extremely small. The use of very fine wire is made possible by using a frame of glass, metal or other suitable material, to support the grid. Thus, in figs. 1 and 2 the filament is mounted in the centre of a frame made of glass rods, on which the fine grid wire is wound by means of a lathe. The grid may thus consist of tungsten wires of a diameter as small as 0.01 mm., and these may be spaced as close as 100 turns per centimetre, or even more.

In figs. 1 and 2 are shown two types of pliotron. Fig. 1 shows a pliotron such as is used for amplifying radio-signals in a receiving station. Fig. 2 shows a large pliotron which the filement used the distance between allowed and grid the of filement used the distance between allowed and grid the

telephony.

The characteristics of the pliotron depend upon the length of filament used, the distance between filament and grid, the spacing between the grid wires, the diameter of the grid wires, the distance between grid and anode, and the size and shape of the anode. The important elements in the characteristics of a pliotron are, first, the relation between the current flowing between anode and cathode as a function of the potential on the anode and of that on the grid; second, the current flowing to the grid, as a function of the potential of the grid and the potential of the anode.

Fig. 3 gives the characteristics of a small pliotron such as that shown in fig. 1. Curve A gives the current flowing to the anode for different grid potentials, while the potential of the anode is maintained constant at 220 volts. Curve G gives the current flowing to the grid under the same conditions. For different anode potentials, these curves are shifted vertically, by amounts proportional to the change in anode potential.

Fig. 4 gives similar characteristics for a large pliotron like that shown in fig. 2. In this case the anode potential was

Fig. 4 gives similar characteristics for a large pliotron like that shown in fig. 2. In this case, the anode potential was

that shown in fig. 2. In this case, the anode potential was 8,500 volts.

By using a fine grid, the current to the anode can be stopped entirely by even a very slight negative potential on the grid. On the other hand, a rather low positive potential will then be sufficient to draw a large current to the anode. The amount of current taken by the grid would be only a very small fraction of that flowing to the anode, in case the diameter of the grid wires is small compared to the distance between them. On the other hand, with a coarse grid—that is, a grid in which the spacing is large, a rather large negative potential may be necessary in order to stop the current flowing to the anode. Similar results to those obtained by changing the relative distances between the electrodes. ing the relative distances between the electrodes.

By using a fairly coarse grid, consisting of fine wire, it is possible to obtain a control of the current to the anode, always using a negative potential on the grid. Under these conditions, since there are no positive ions present, no current flows to the grid, except that necessary to charge it electrostatically to the required potential. It thus becomes possible to control very large amounts of energy in the anode circuit, by means of extremely minute quantities of energy in the grid circuit.

There does not seem to be any upper limit to the another than the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control

by means of extremely minute quantities of energy in the grid circuit.

There does not seem to be any upper limit to the voltages that may be used in the pliotrons. With voltages over 30,000 it is often necessary to space the electrodes further apart and to use heavier wires for the grid, in order to reduce the danger of breakage of the parts by the large electrostatic forces which then occur.

The current-carrying capacity of the pliotron is limited only by the size of cathodes that it is found convenient to use and by the voltage available. Large currents cannot be readily obtained with low voltages because of the space charge effects described previously. With voltages above 500 volts, however, it is found practicable to use currents of 300 or 400 milliamperes for a pliotron of the type shown in fig. 2. With high potentials, there is no difficulty in using currents as large as this, provided the energy is consumed in some device in series with the pliotron. On the other hand, if the full voltage is applied to the anode while the current is flowing to the anode, the energy liberated in the form of heat may be so great as to volatilise the anode or cause it to radiate so much heat that the glass parts of the apparatus are softened. In a pliotron with a 5-in. bulb the amount of energy that may be so consumed within the pliotron is about 1 kw. Still larger amounts of power may be dissipated if the bulb is immersed in oil and if the grid frame is made of quartz, or other heat-resisting material.

It is evident from the characteristics of the pliotron that any number of these devices may be placed in parallel, and

It is evident from the characteristics of the pliotron that any number of these devices may be placed in parallel, and that in this way very large amounts of power may be

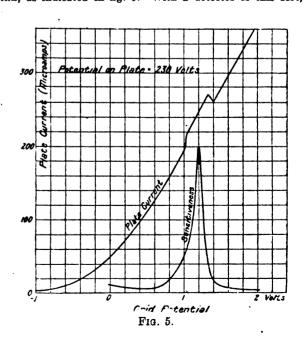

controlled.

controlled.

Pliotron as Wireless Detector.—If the antenna of a receiving set is coupled directly to the grid of a pliotron and a telephone receiver is placed in series with the anode, signals may be readily detected, but the results obtained in this way are usually very poor. Under these conditions, the sensitiveness of the arrangement is proportional to the curvature of the curve A, fig. 3 (or, more accurately, proportional to the second derivative of the anode current with respect to the grid potential). This curvature may be somewhat increased by applying a negative potential to the grid, but even under these conditions the sensitiveness of the arrangement is usually not very high.

If it is attempted to use a condenser in series with the grid and thus use the pliotron in the way that the audion is often used, it is found necessary to shunt the condenser with a resistance and often place a battery of a few volts in series with the resistance, in order to prevent a large negative charge from accumulating on the grid.

It has been found, however, by W. C. White, that a very minute trace of certain gases may very greatly increase the sensitiveness of this device as a detector. For example, by placing within the bulb a small quantity of an amalgam of mercury and silver, the characteristics of the tube show a kink, as indicated in fig. 5. With a detector of this sort, if

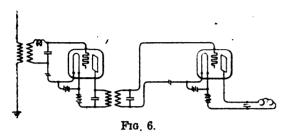

the grid potential is adjusted so that its average value is approximately that at which the kink occurs, there is a very marked increase in sensitiveness. This is due to the fact that under these conditions either an increase or a decrease in the grid potential causes a decrease in the anode current. The sensitiveness of this detector is then very high. The

quantities of mercury vapour necessary to give this effect are so low that anode voltages of 200 or more may be used without any indication of glow discharge.

Pliotron as Amplifier.—The value of a pliotron as an amplifier is dependent primarily upon the slope of the curve between anode current and grid potential; for example, curve A, fig. 3. A second factor of importance is the magnitude of the current taken by the grid. In order to get the greatest amplifying effect it is desirable to have this current as low as possible. In a pliotron of the type shown in fig. 1, the current to the anode increases at the rate of about 1 milliampere per volt change in the grid potential.

By using larger anode potentials, the slope of the curve can be made very much greater, since it becomes possible to use grids of finer mesh. For example, in fig. 4 it is seen that the slope of the curve corresponds to two milliamperes increase in anode current per volt change in grid potential.

It has been found that there is no sluggishness in the characteristics of the pliotron, even at the highest frequencies. By connecting the pliotron as amplifier, as shown in fig. 6, the high-frequency currents received from the grid may be amplified from one hundred to six hundredfold. In this

arrangement, it is the high frequency or radio-frequency that is amplified, and not the audio-frequency. This amplification of the radio-frequency possesses the marked advantage that the detector circuit may be tuned to the same frequency as the amplifier circuit, and in this way a very marked increase in selectivity is obtained. In fact, it has been shown by Mr. Alexanderson that the resonance curve of an outfit consisting of amplifier and detector, both tuned to the radio-frequency as shown in fig. 6, may be obtained from the resonance curve for the detector alone, by squaring the ordinates. For example, if with a single detector, the signals from one station (A) are received one hundred times as strong as those from another station (B), then, with the above arrangement with the amplifier, the signals from A will be received one hundred times squared, or ten thousand times as strong as those from station B. If two amplifiers be used in this way, the signals from station A can be obtained one million times as strong as those from station B. those from station B.

In practice, this arrangement has been found to give a

from station A can be obtained one million times as strong as those from station B.

In practice, this arrangement has been found to give a wonderfully high degree of selectivity.

Of course, a plictron may also be used for amplifying the audio-frequency, coupling the circuits together by means of an iron core transformer. A single photron, under these conditions, gives an amplification of current of several hundred-fold, when voltages of from one to two hundred volts are used on the anode.

Plictron as Oscillator.—By placing inductance and capacity in the grid and plate circuits and coupling these two circuits together, it is possible to use the plictron as a source of continuous oscillations. Small plictrons of the type shown in fig. 1 may produce oscillations up to a few watts, and these may be used in a receiving station, according to the Heterodyne principle, for receiving continuous oscillations. One plictron may be used for both amplifying or detecting, and for producing oscillations.

With the larger plictrons, using voltages of a few thousand volts, up to a kilowatt of high-frequency oscillations may readily be produced by a single tube.

Use of the Plictron in Radio-Telephony.—By means of a single large plictron, it has been found possible to control about two kw. of energy in an antenna, by means of the currents obtained from an ordinary telephone transmitter. There are many arrangements by which this may be accomplished For example, a two-kw. Alexanderson alternator (100,000 cycles) may be loosely coupled to the antenna and the anode of the plictron may be connected to a point on the antenna where the potential is normally high. As long as the potential on the grid of the plictron is strongly negative, no current flows to the plictron and, therefore, the full energy is radiated by the antenna. If, however, the negative potential on the grid of the pnictron. It is thus possible to control the output of the antenna by varying the negative potential on the grid of the plictron. Since the grid and filam

telephone transmitter, to obtain potentials on the grid of several hundred volts, and thus to control the output of the antenna

Instead of using an arc or alternator as a source of high frequency current, the pliotron may also be used as generator of the oscillations. One pliotron may be used both for producing the oscillations and for controlling the amplitude of ducing the oscillations and for controlling the amplitude of the oscillations, in accordance with the sound waves acting on the telephone transmitter. It is usually preferable, however, to use a large pliotron for producing the oscillations and to connect a small pliotron in the grid circuit of the large pliotron for controlling the output of the latter.

With the above arrangement an extremely simple and efficient radio-telephone outfit can be made. Since the pliotron for producing oscillations requires comparatively high direct-current voltages, it has been found convenient to combine the pliotron oscillator with a kenotron rectifier. Two types of apparatus of this type have been in use a considerable time.

combine the pliotron oscillator with a kenotron rectifier. Two types of apparatus of this type have been in use a considerable time.

In the first outfit, which is a small outfit having a capacity of about 20 watts in the antenna, the source of power is the local city supply, which is 118 volts, 60-cycle alternating current. This is connected with the primary of a small transformer, having two secondary windings. One of the secondaries is designed to give about 5 volts, and furnishes the current used for heating the filaments of the kenotrons and pliotrons. The other secondary of the transformer is wound to furnish a potential of about 800 volts. This is rectified by means of a kenotron, and serves to charge a condenser of about six microfarads. In this way a source of high-voltage, direct current is obtained in a very simple manner. The plate of the pliotron oscillator is then connected to one of the terminals of the condenser, while the filament is connected to the other. The plate of the second pliotron is connected to the grid of the first, while the grid of the second is coupled by means of a second small transformer to the microphone circuit. With this outfit, both pliotrons may be relatively small, and in order to obtain about 20 watts in the antenna, it is found that the current drawn from the condenser is so small that the potential supplied by it does not vary sufficiently to be audible in the signals sent out. The different parts of this apparatus may be made very compact, and no adjustments are found necessary in operating the system unless it is desired to change the wave length. In this case, it is only necessary to change the inductance or capacity.

In the second outfit, which is suitable for use up to 500

the system unless it is desired to change the wave length. In this case, it is only necessary to change the inductance or capacity.

In the second outfit, which is suitable for use up to 500 watts or more, the high-voltage direct current is obtained from a small 2,000-cycle generator. The current from this is transformed up to about 5,000 volts, rectified by kenotrons, and smoothed out by means of condensers. By the use of 2,000-cycle alternating current instead of 60-cycle, it is possible to store up large quantities of energy and thus obtain as much as a kilowatt or more of power in the form of direct current with condensers of moderate size. This high-voltage direct current is then used, as before, to operate a pliotron oscillator, the output of which is controlled by means of a small pliotron connected to the telephone transmitter.

By means of this system of control the amount of energy in the telephone transmitter circuit need be no larger than those commonly used in standard telephone circuits. It has thus been found possible to connect up this radio-telephone outfit with the regular telephone lines, so that conversation may be carried out between two people, both of whom are connected with the radio-stations by means of the regular land lines. It has also been found possible to communicate both ways over these lines.

## NOTES FROM CANADA.

[FROM OUR SPECIAL COBRESPONDENT.]

SOME time ago it was pointed out in the REVIEW that the sign commonly used to denote cycles, viz., ~, is without a name, which, of course, is a very inconvenient state of affairs. To get over this difficulty, the writer would suggest the use of a ready-made Spanish word, "tilde," which is the name used for the sign, of almost exactly similar shape, used over one of the letters of the Spanish alphabet, thus, \hat{n}; this name is not a hard one to remember, and its pronunciation—teeldeh—presents no difficulty whatever.

Whether the B.E.A.M.A. has perused these "Notes" during the last year or two is not known, but it would appear that action is likely to be taken before long on the lines indicated more than once likely to be taken before long on the lines indicated more than once herein, namely, the establishment of branches in the Colonies, especially in Canada, so that the local representatives of British firms may combine together for their common good and secure recognition, and effect reforms of certain existing conditions where individual efforts are bound to be ineffective.

The Dominion Government, through the Water Powers Branch of the Department of the Interior, has during the last few years been amassing information regarding water-power possibilities, which will prove very useful in the future, as the records of rainfall, run-off, stream levels, watershed areas, and storage possibilities, &c., extend over a sufficient length of time to give

reliable maximum, minimum, and average figures. The following are two brief extracts showing the kind of information which is

are two brief extracts showing the kind of information which is published by the Department from time to time:—

1. "Bridge River.—A head of 2,000 ft. could be developed at Bridge River by driving a tunnel through the ridge separating it from Seton Lake. The water would be diverted into the tunnel from Bridge River and conveyed from the other portal by steel penstocks to the power-house situated on Seton Lake. A great amount of power could be developed here, but the cost of the tunnel would render a large initial development necessary."

2. "Chehalis River.—The plan of development of this stream includes a storage and intake dam near the lower end of Chehalis Lake and a large concrete pipe line, some 10 miles in length, to an equalising reservoir near the mouth of the river. The penstocks would lead from the reservoir to the power-house, and would give a head of about 400 ft. Chehalis Lake would give splendid storage."

Au immense amount of information in the form of tables of stream flow data, & ..., is embodied in these reports, as well as maps showing the location of the various water powers.

showing the location of the various water powers.

The Electrical Development Co., at Niagara Falls, on the Canadian side, is the first company to have installed plant up to the maximum capacity of its available water power. There are now four generators of 13,000 H.P. each, and seven of 15,000 H.P., making a total of 157,000 H.P.; of this amount, 125,000 H.P. represents the available water power, and the remainder is spare plant. All the power is to be used in Toronto.

Owing to the war, Toronto, which last year ordered large numbers of electricity meters from Germany, has this year arranged to buy British-made meters instead. Sic transit gloria Germanic.

## LEGAL.

## A WESTINGHOUSE EMPLOYÉ FINED.

A WESTINGHOUSE EMPLOYÉ FINED.

At Manchester on Thursday, May 20th, the British Westinghouse Electrical and Manufacturing Co., Ltd., Trafford Park, claimed £5 from Thomas Henry Hargreaves, a surface grinder in their employ, for unlawfully absenting himself from work.

SIE WM. COBBETT, for the company, stated that his clients had two surface-grinding machines, and defendant worked on one of them. The machines were used for putting a very fine finish on tools which were used for working upon shell fuses. The firm were under contract with the Government to supply munitions of war, and if one of the two surface grinders absented himself from his work it meant that 50 per cent. of the production of tools was stopped, the production of fuses for shells was impeded, and the company suffered substantial loss. The claim now brought was merely nominal; no attempt had been made to estimate the loss which had been sustained through defendant's action, but the magistrates would readily believe that it must have been substantial. Ordinarily the defendant worked 52½ hours per week, and was paid £2 4s., but he and the other surface-grinder sometimes worked as long as 80 hours per week, when their earnings were very much more than the figure mentioned. Unfortunately Hargreaves would not attend regularly to his work, and he was afraid the cause was drink. On several constitute the had absented him. greaves would not attend regularly to his work, and he was afraid the cause was drink. On several occasions he had absented himself, and had been warned, and the company had even taken him on when he was obviously not in a condition to do his best work.

ROBERT W. WROE, foreman in the tool department, said the tools were absolutely necessary for the making of munitions of war, and surface grinding was highly skilled work. For some war, and surface grinding was highly skilled work. For some months past the company had been working at the highest pressure they had experienced since the works were opened. On one occasion when defendant returned to work after being absent he admitted that his absence had been due to drink, and he expressed his regret and said he would try to b) teetotal. Later defendant was absent six days, with a consequent loss of 52½ hours. On April 12th they had to search for him, and when he was eventually found he returned to his work in a state of collapse after a drinking bout. The present summons referred to defendant's absence from May 3rd to May 8th inclusive.

The Bench ordered defendant to pay £4, and he was allowed a month to pay the money.

month to pay the money.

## GLASGOW TRAMWAY ACCIDENT CLAIMS.

SEVERAL cases arising from tramway accidents are pending in the Court of Session against the Glasgow Corporation. In one case a Dannistoun man sues for £500 damages for personal injuries. He was in the act of descending from one of the Corporation cars when, he says, the car was suddenly set in motion, and he was jerked off the platform. Fault is denied. In another case where a "violent jerk" is alleged as the cause of the injuries the Corporation pleads that the motorman brought the car to a standstill, preventing a collision. Yet another case in which a contractor sues for £500 is the sequel to a collision between a car and a lorry. The Corporation denies that the lorry was showing any lights, and says that the accident was due to pursuer's negligence. negligence.

## Re W. T. GLOVER & Co., LTD.

In the Chancery Division on Friday last week Mr. Justice Astbury sanctioned the proposed extension of the objects of W. T. Glover and Co., Ltd., of Trafford Park, manufacturers of electrical cables, wires and apparatus. Mr. Peterson, K.C., said the company was a prosperous one, and for the economical and convenient working of the existing objects as well as for the advantageous combination. with other classes of business, it was proposed to acquire and work lead, copper and coal mines, and to small the ore and refine and treat the copper, lead and bitumen. The company also took power to sink wells, and with other companies to construct bridges across the Bridgewater Canal for the purpose of the extension of its works.

#### TRAFFIC AT TRAMWAY STOPPING PLACES.

BAILIE BARRIE, at Glasgow Southern Police Court, heard the first of the prosecutions under the new city by-law for the regulation of vehicular traffic near tramway stopping stations, which came into operation on May 1st, a taxi-cab driver being charged with having, at a point near a tramway stopping place, failed to draw up his cab before the roadway was clear of passengers entering or leaving a tramcar. In imposing a fine of one guinea, the magistrate said that the practice of driving in among passengers boarding or leaving tramcars must be stopped.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

## B.T.H. Automobile Accessories.

Some interesting devices are described in a recent list (No. 10,780) of the BRITISH THOMSON-HOUSTON CO., LTD., Maxia House, 77, Upper Thames Street, E.C., in connection with the use of electricity on automobiles. We illustrate in figs. 1 and 2 a

FIG. 1.—SWITCHBOARD CLOSED.

switchboard with a single handle, which performs all the nec switchboard with a single handle, which performs all the necessary operations by actuating the controller shown in fig. 2. The various positions of the switch are indicated at a small window in the aluminium cover (fig. 1). The switch is so arranged that mishandling of the charging of the battery is impossible; whenever the head lights are put on, the charging switch is automatically closed; only the side and tail lamps can be used without charging, thus avoiding any overload on the battery. Ampere and voltmeters are provided, and a two-pin plug for connecting an inspection lamp. A tail lamp indicator in the shape of a small lamp giving a subdued light shows when the tail lamp is burning, and lights up the switch indicator and instruments sufficiently

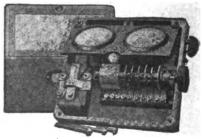

FIG. 2.-SWITCHBOARD OPEN.

to enable them to be read from the driver's seat; this lamp is not in series with the tail lamp, so that if anything goes wrong with it the tail lamp is not affected. The switchboard can be used with any standard dynamo, or with accumulators alone. A smaller set without instruments, but with a charging indicator and automatic cut-out, is also made.

Various other devices, such as car lighting and ignition batteries, meters, lamps, electric horns, sparking plugs, &c., as well as, of course, Maz la automobile lamps, are included in the list.

. **k** 

The name of the BENJAMIN ELECTRIC, LTD., has always been associated with metal stampings and spinnings, their most wellknown product in this direction being the Benjamin steel line of reflectors and reflector fittings, all of which are produced at their London works, 1A, Rosebery Avenue, E.C. A large amount of special work in the spinning line has been executed by the firm special work in the spinning line has been executed by the him from time to time, and its latest effort on war material calls for particular attention, constituting as it does (as far as can be ascertained) a record for large spinnings. This consisted of a large quantity of aluminium covers and was executed for Government use. Fig. 3 gives a fairly adequate conception of the size of these spinnings, which were spun from aluminium blanks of

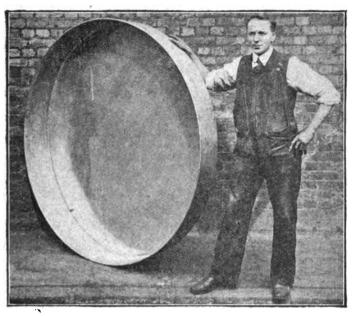

FIG. 3.-A LARGE ALUMINIUM SPINNING

14 G metal, 7 ft. in diameter, a proceeding demanding a maximum of care and precision, together with an expert knowledge of spinning as an art. The finished covers measured 5 ft. 6 in. in diameter, and were approximately 9 in. deep. Only a few works are equipped to carry out such spinning work as the above.

## "Witton" Main Regulator.

The accompanying illustration shows a main regulator, which has been made by the GENERAL ELECTRIC Co., LTD., of 67, Queen Victoria Street, London, E.C., for a large firm of turbo-alternator manufacturers. The "Witton" standard rectangular face-plate

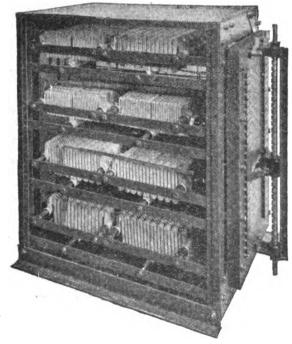

Fig. 4.—Interior of "Witton" Main Regulator, with GRID RESISTANCES.

construction is used, together with standard grid resistances mounted on a strong angle-iron framework. The strength and compactness of the unit can be readily appreciated from the illustration.

### WAR ITEMS.

Technical Institutions and Enemy Members.—The Iron and Steel Institute has struck the names of over 100 members of enemy nationality off its roll. Considerable numbers of enemy members are on the rolls of the Institutions of Civil and Electrical Engineers. It is reported that the German institutions are striking the names of members belonging to the Allied nations off their rolls, and German members of Allied institutions are renouncing

their membership.

Writing editorially on this subject in its last issue, the Engineer says:—"The action taken by the Iron and Steel Institute at the annual meeting to close its ranks against enemy members raises a question of great interest at the present juncture. Under ordinary circumstances the war between Great Britain and other European circumstances the war between Great Britain and other European nations need not have been waged within the confines of our technical institutions. It has always been one of the boasts of science that it did not recognise the boundaries created by geographers or politicians, and that even differences of race and language did not imply a divergence of interests when the claims science were at issue. It is a thousand nities that this 

of our chief enemy, has not been dictated by either passion or prejudice, but is the outcome of a jealous regard for its own honour. There are other scientific and technical societies which, honour. There are other scientific and technical societies which, if they have not already done so, will no doubt take steps to erase from their list those foreign members who are to be numbered among our enemies. The Society of Chemical Industry, the Royal Institution, the Royal Society, the Institution of Electrical Engineers and others have a certain percentage of foreign memberahip. It may be that in some instances there are technical difficulties and legal objections to be overcome. These, however, should not be allowed to stand in the way, and we may expect to hear that all our engineering and scientific bodies have eliminated from their roll of membership all subjects of the countries with which Great Britain is now at war, if for no other reason as a protest against the inhuman methods of warfare introduced by our enemies. This is not the time to shrink from the performance of a plain duty." performance of a plain duty.

Lamps for Johannesburg.—We have received a cutting from the Cape Times, in which its Johannesburg correspondent states, under date April 28th:—"At the Johannesburg Town Council last night, the Finance Committee recommended the acceptance of Messrs. H. Davies & Co.'s tenders for the supply of electric lamps, at a cost of £1,142.

"Mr. Williamson pointed out that presumably the articles that were proposed to be accepted were made in Holland. The difference between these and the tender for British-made lamps was £500 against the latter, and they might reasonably assume that these lamps made in Holland were really made in Germany. In fact, he had evidence to that effect. They did not know what the position of Holland was in regard to the war, but in view of the latest information it might be that Germany had got Holland to come into line with her. It was, therefore, the duty of Britishers, no matter what the cost, to keep the British workman in employment. Was their money to be given to British workmen, or was it to go to Holland for the real benefit of Germany? Indeed, this tender of Davies & Co. could not be so low if it were not a real case of dumping. They had every ground to have suspicions of the low price—30 to 40 per cent. below the British price. He had nothing to say against Holland, but the sentiment of the Council should at once and always be in favour of Great Britain. He nothing to say against Holland, but the sentiment of the Council should at once and always be in favour of Great Britain. He opposed the recommendation. Holland was merely a receiving house for Germany, and the money they sent to Holland would in this case be wages for German workers, either in whole or in part, for lamps such as these.

"Mr. O'Hara moved that the report be referred back, and supported the principal arguments advanced by Mr. Williamson. Mr. Murray seconded. Mr. Deys objected to slurs upon the attitude of a neutral country—Holland.

"The amendment was finally negatived, and the report adopted."

No Murricipal Money for Pines Bond.

No Municipal Money for Pipes Band.—At last meeting of the Glasgow C.C., Councillor Taylor drew attention to a proposal by the Electricity Committee to present to the Division of Royal Engineers and Brigade of Artillery, which are being raised by the T.C., the necessary equipment and instruments for a pipe band. He contended that the Committee had no power under its Act to take any part of its revenue for this purpose, and he held that the expenditure was therefore illegal. The Town Clerk concurred in this view, and the Lord Provost declared the minute incompetent.

Oldham Tramways and War Bonuses.-The refusal of the T.C. to grant a war bonus to certain section of the employés has caused much dissatisfaction to the men concerned, and a demand is being made to have the question reopened. The T.C. has twice refused the application on the plea that it would mean an extra burden on the ratepayers.

Electric Sterilising of Wounds.—Amongst the hospital applications of electricity in the European war is reported the sterilising of wounds by zinc. A pad with zinc sulphide is placed on the wound, and being connected to the positive pole of a battery, is said to make the surrounding tissues antiseptic by the zinc salt forced into them. The method is pronounced efficient and speak wherever available. and speedy wherever available.

Board of Trade Inquiries .- In the list issued by the Board of Trade C.I. Branch for the week ended May 15th, the following inquiries for sources of supply of goods are recorded :-

Electrical apparatus, Ac.:—

Brass sockets with vitrite case for electric metal-filament and carbon lamps.

Cables, porcelate insulators, and electric lampholders.
Electric lamps (wire drawn, economical).
Electric pocket lamps.

Wooden mounts for electric light fittings.

Glass and glassware:—

Miners' lamp, glasses.

Opal shades for electric lights.

Tubing (sample).

Names of firms abroad open to purchase the following articles have also been received and recorded:—

Agate bearings for scales and electrical meters.
Diesel engines.
Electrical accessories, unspecified.
Glass and gra sware:—
Coemical beakers and test tubes.

Westinghouse Staff and Munitions of War.-We learn that a movement was started a short time ago by the engineering and other office staff of the British Westinghouse Electric and Manufacturing Oo., Ltd., to express in a practical form their patriotic feelings, and it was suggested by them to the management of the company that they should undertake in their spare time some manual work on munitions of war. This offer was accepted by the management, and operations were commenced almost immediately. For the present, each man will work a 5½ hours shift one night per week, commencing at either 6.30 in the evening or 12 o'clock at night. We understand that approximately 300 staff men have already volunteered for work on this basis.

Technical Schools and Munitions.—The Industrial Reserve of 227, Strand, W.C., is organising the technical schools throughout the country in connection with the production of munitions of war; the results already attained are very satisfactory. It is proposed to employ members of the Reserve in small engineering shops, supplying larger firms with standardised small parts.

Personal.—On the occasion of his departure to take up a lieutenancy in the Royal Marines (Submarine Miners), Mr. H. M. Taylor, borough electrical engineer of Middlesbrough, was pre-Taylor, borough electrical engineer of Middlesbrough, was presented by the staff of his department with a wristlet watch. Councillor Joseph Calvert, J.P. (chairman of the Electricity Committee) made the presentation. He stated that he could pay no greater compliment to Mr. Taylor than mention the fact that the majority of the staff had been with him during the whole of his 13 years' service, working harmoniously the whole time. He felt sure that Mr. Taylor's knowledge would be of great service to the Royal Mirines. Mr. Taylor suitably responded. A few remarks by Mr. Telford and Mr. Scotson brought the ceremony to a close.

Mr. Taos. Edwin Scharffetter, of Hale and Manchester, electrical engineer, a natural-born British subject, has adopted the surname of Shorter.

of Shorter.

Owing to unfounded rumours as to the nationality of Mr. C. A. Blassheck, city electrical engineer at Canterbury, the Mayor, on Blascheck, city electrical engineer at Canterbury, the Mayor, on May 19th, deemed it necessary publicly to state that Mr. Blascheck was not a German, but an Englishman. His father was a German, who came to England 48 years ago, and three years later was naturalised. Mr. Blascheck's mother was an Englishwoman, and Mr. Blascheck was born in England, and had lived in the country all his life, except for a few years, during which he was sent to Germany to learn the technical work of his profession. The Council passed a vote of confidence in Mr. Blascheck.

Private T. Flynn who, before the war, was engaged at Darwen electricity works, states in a letter home:—"If there is a single man in England to-day physically fit for the Army or Navy and he has not joined he must be wholly ashamed of himself."

Roll of Honour.—Mr. Leslie Smith, of Blackburn, has been wounded in the Dardanelles. Four years ago he left Blackburn, where we was employed as an electrician, for Australia, and on the outbreak of war joined the Infantry Brigade. He sailed on the ss. Duslinger, a captured German ship, and Private Smith was made the ship's electrician. He had only been in the firing line an hour when hurt.

Private Chas. Walker, of the clerical staff of the Torquay Corporation electricity works, has been killed in action. On the outbreak of war he joined the 2nd Devon Regiment. Private Fred. Squires, of the same regiment, who was a conductor on the Paignton

section of the Torquay tramways, has also been killed at the front.

Intelligence has been received at Chelmsford that Lieut.-Com.

Hubert Dobell, Royal Naval Volunteer Reserve, is missing and that it is believed that he was taken prisoner whilst making observations for aircraft. Prior to the war he was on the Marconi Experimental Staff. at Chelmsford.

Private John Chumley, who had been employed in the power house at the works of the St. Helens Cable Co., has been killed in action. He was 24 years of age. His father, Mr. Samuel Chumley, is also employed by the St. Helens Co.

We deeply regret to read in the Times advertisements that Lieut.

Brian Crossley, 3rd Batn. Highland Light Infantry, attached 2nd Batn., youngest son of the late Sir Wm. Crossley, Bt., was killed in action in France on May 18th. Lieut. Crossley was known to many of our engineering readers by reason of the part he filled in the famous firm of Crossley Bros., Ltd., of Manchester. He was 29 years of age.

## BUSINESS NOTES.

Catalogues and Lists .- RICHMOND GAS STOVE AND METER Co., LTD., Warrington.—Illustrated list, giving brief descriptive notes relating to natural draught gas-heated furnaces, &c., for expediting the production of shells and war requirements. The furnaces are in service in the principal ordnance factories and by motor and engineering forms. by motor and engineering firms.

MESSES. TURNER BROS., LTD., Roch attention to their hair and Balata belting. Rochdale.—Folders drawing

MESSES. J. H. HEATHMAN & Co., Parson's Green, Fulham, S.W. —Card giving prices and particulars of their patent fold-up step ladder with chair seat.

Messes. Simplex Conduits, Ltd., 116, Charing Cross Road, London, W.C.—A series of eight serviceable size blotters has been issued, the letterpress side of which keeps before the mind of the user one or other of the company's specialities—conduits, distribution boards, watertight accessives, electric light fittings, hand lamps, and shop window reflectors. Also a small eight-page booklet entitled: "Wiring for Electric Light and Power," and dealing generally with the merits of the Simplex conduit system. Copies of either the blotters or the booklet will be sent to any engineer on application. engineer on application.

MESSES MICKELWEIGHT, LTD., Alperton, Wembley.—Illustrated priced leaflets relating to their sliding contact resistances.

WORTHINGTON PUMP Co., LTD., India House, Kingsway, London, W.C.—Twelve-page illustrated pumphlet (No. 1,054) containing a description of a new type of motor-driven rotary dry-air pump, which they are putting on the m\rket.

Book Notices.—We have received a copy of No. 2 of Records of Railway Interests in the War," published by the Rilway News (one shilling). It is fully and interestingly illustrated, and contains a vast quantity of information concerning the many ways in which British railways and their staffs and employés are performing their part in connection with the war.

"Continuous Current Electrical Engineering." By W. Tolmé Maccall. London: University Tatorial Press, Ltd. Price 10s. 6d.

The May issue of The Central contains articles on the British Association visit to Australia, by G. W. O. Howe; the mercury arc, by T. M. Lowry; D. essel engine troubles, by A. C. Branch; the possibilities of domestic electricity, by H. W. Purle; and various other matters, as well as a Roll of Honour containing no fewer than 633 names—341 officers and 292 of other ranks. From the Imperial College as a whole the total number of men on active service is about 1,030. The annual report of the Old Centralians for 1914 shows a very satisfactory condition as regards both profor 1914 shows a very satisfactory condition as regards both proceedings and finance.

Messrs. A. P. Lundberg & Sons have issued a third edition of their booklet, "The Teaching of Electric Light Switching," a subject which has now obtained a firm footing in technical colleges. Teachers of wiring classes will find this an excellent guide in arranging their lecture and demonstration courses.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXIV, No. 5. May, 1915. New York: The Institute. Price \$1.

For Sale.—Kirkcaldy Corporation has for disposal 3,600 pairs of Conradty "C" carbons, particulars of which are given in our advertisement pages to-day.

South Africa.—A firm of agents in Cape Town, with a branch office in Johannesburg, a partner of which will shortly be in London, desires to secure the representation of United Kingdom manufacturers of high-class electrical and art metal fittings. Apply to the Board of Trade, C.I. Branch, London, for

Deed of Assignment.—Louisa Fellows (L. Fellows), electric light contractor, 72, Victoria Boad, Surbiton.—Last day for claims for dividend, June 2nd. Trustee, Mr. G. C. Corfield, Balfour House, Finsbury Pavement, E.C.

Liquidations.—Oldham Boiler Works Co., Ltd.-Particulars of claims must be sent by July 3rd to the liquidator, Mr. H. Hague, Retiro Chambers, Yorkshire Street, Oldham.

ATLAS ELECTRICAL Co., LTD.—This company is winding up voluntarily, with Mr. P. F. Hedges, of 53, Cannon Street, E.C., as liquidator. A meeting of creditors is called for June 1st.

Trade Announcements.—The building occupied by MESSRS. TYLER & FREEMAN, at 20, New Bridge Street, London, E.C., for the last 19 years is being pulled down and the firm are moving to larger premises at 40, Chancery Lane, W.C. New telephone Nos.: Holborn, 6490 and 6491. Telegraphic address: "Potential Hilb., London." Firms are invited to forward copies of recent catalogues.

The GATH ELECTRICAL ENGINEERING Co., with which is incorporated E. Sykes, is, after reconstruction, opening showrooms in Southgate, Halifax.

THE ELECTRICAL

Fire. On May 21st, a fire occurred at the premises of MESSES CHARLES MACINTOSH & Co., LTD., india-rubber manufacturers, Chorlton-on-Medlock. The fire broke out in the spreading department, which was practically destroyed.

Bankruptcy Proceedings.—H. J. Godfrey, electrical engineer, late of 188, Balbam High Road, S.W.—A first and final dividend of 91d, in the £ is payable on June 11th, at the Official Receiver's offices, 132, York Road, Westminster Bridge Road, S.E.

## LIGHTING and POWER NOTES.

Accrington.—Price Increase.—It is stated there is to be an advance of 20 per cent, in the Corporation's charges for current to electricity users, and, in addition, the discount of 10 per cent. hitherto allowed may be reduced to 5 per cent., so that, if these proposals are carried through, the advance will be equal to about 27 per cent, on present charges

Aldershot. -- PLANT EXTENSIONS. -- The L.G.B. has asked the Council to furnish a detailed statement of the works which a loan of £8 500 has been applied for. The envineer and the chairman of the Lighting Committee are to wait on the L.G.B. with reference to the matter. As it is deemed imperative that the new boiler plant should be at o.c.; installed, it was divided to take the money needed temporarily from reserve, and refund it if a loan the money needed temporarily from reserve, and refund it if a loan is sanctioned.

Argentina.—By decree of the National Government, the clau-e in the new port of Buenos Aires construction contract providing for the erection of an electric power house and machinery by Messrs. C. H. Walker & Co., has been annulled.

Aylesbury.—The U.D.C. has approached the Bucks Education Committee as to proposals for electric lighting, and the Committee has replied that at present it cannot entertain the

Barnsley. — ELECTRIC COOKING. — The Education Committee has decided to install an electric cooker in the kitchen for the new open air school.

Bitterne.—Prov. Order.—The B. of T. has informed the South Stoneham R.D.C. than an order has been granted to the Southampton T.C. to extend the E.L. mains to Bitterne, but that the order will not come into operation until after the war.

Blackpool.—The electricity returns continue to show a big increase in private lighting; the output during April was 16,770 units more than during the same month last year. Public lighting took 7,420 fewer units, and the Corporation tramways demand was 20,390 units down.

Bury (Lancs.).—Price Increase.—The Corporation Electricity Committee has decided to increase the price of electricity from July 1st. The charges for private lighting, public lighting and tramways will be increased by the addition of 10 per cent. to each account, and that for power and heating by the addition of 15 per cent,

Castletown-Berehaven.-L.G.B. Inquiry. - An inquiry is about to be held into the powers required for the lighting of the town; the introduction of an electrical system has been suggested.

Continental.—Spain.—A concession has lately been granted for the establishment of a plant to utilise the water power of the river Mundo at Hellin for the generation of electrical energy for lighting and power purposes.

Crayford.—The West Kent Electric Co., which has secured the lighting of 200 houses to be erected on the Northumberland Heath Estate, has asked the P.O. to allow it to quote terms for the street lighting of the estate. The matter has been referred to the Lighting Committee, which is considering the lighting of the Barnes Cray Estate.

Cumberland .- POWER SCHEME .- The Manchester Dispatch states that great importance attaches to a scheme in progress under the auspices of the Cumberland Waste Heat Owners' Co., Ltd., in which the Whitehaven Hematite Iron and Steel Co., Ltd., is largely interested, for the conversion of the waste gases from the farnaces at Cleator Moor into electrical power for the ore mines in the north-west hematite producing district. The plant, which will have a capacity of 2,200 kW., will be in operation by

Darlington.—The L.G.B. has informed the T.C. that loans will not be advanced for the laying of mains and connections. The Electricity Committee is considering the desirability of increasing the charges for current.

Ely.—Prov. Order.—The Gas and Electricity Co. has decided not to proceed with the application for a prov. order for E.L. in the Urban Council's area. Oci ctions had been lodged with the B. of T. by the Ratepayers' Association and others.

Grays.-Loan Refused.-The L.G.B. has informed the U.D O, that at the present time it cannot sanction the loan of £600 applied for, for electricity purposes.

-ASYLUM INSTALLATION.—The C.C. has decided o adopt electricity at the new Asylum at Park Prewett for pumping, laundry and baking machinery, cold storage and auxiliary cooking plant. The voltage will be 220 for the installation; on the grounds of cleanliness and convenience it has been decided to install the light in the cottages.

Harrogate. -Extended Supply Area. -The B. of T. has granted the T.C. an order authorising it to supply current at Nidd, Plompton, Starbeck, Pannal, Haverah Park, Hampsthwaite, Killinghall, Ripley, Birstwith, Hartwith-cum-Winsley, and Clint.

Huddersfield.—RESTRICTED LIGHTING.—On account of the non-lighting of arc lamps, the Corporation Electricity Committee has allowed the T.C. a rebate of 50 per cent. off the public lighting account.

Kettering .- YEAR'S WORKING .- During the last financial year the Council's electricity undertaking sold 1,890,544 units, the maximum demand being 1,102 kW. The total revenue amounted to £15,107, and working expenditure to £7.448, leaving £7.659 as gross profit. Financial charges absorbed £3.953; £1,000 was placed to reserve fund, which now totals £3,200; and a balance of £4.387 was carried forward, as against a balance of £3.659 horoget forgard from the previous year. £3,663 brought forward from the previous year.

Kingston-on-Thames.—The Sanitary and Drainage Committee has agreed to an increased charge of 10 per cent. for all current used for sewage works purposes.

Leck.—INCREASED PRICES.—The U D.C. has decided to advance from Jaiy 1st the present charges for current to all consumers by 10 per cent.

London.—HAMMERSMITH.—The Electricity Committee

London.—Hammersmith.—The Electricity Committee has decided to give supplies of electricity to the Notting Hill Electric Lighting Co., Ltd., and Fermans, Ltd., at a uniform rate of 1½d. per unit, less 33½ per cent. discount when the supply for power and lighting exceeds £100 per annum.

Stepney.—The L.C.C. has informed the B.C. that the borrowing of £15,000 for mains may be sanctioned, but that the order ranctioning the borrowing will not be issued until the B.C. has agreed to limit expenditure on the provision of mains during the war to the laying of mains to supply electrical energy to consumers engaged on work for the War Office or Admiralty only. The Electricity Committee recommends the Council to agree to this.

The Electricity Committee reports that the plant necessary to enable the Council to furnish the Shoreditch Council with electrical energy in bulk has been installed and will be available on September 30th next. It is necessary under the terms of the supplemental agreement to give the Shoreditch B.C. notice by June 30th of the Council's ability to give this supply. The borough electrical engineer has been authorised to give such notice.

Manchester.—L.G.B. INQUIRY.—On the 21st inst. Manchester.—L.G.B. INQUIRY.—On the 21st inst. an inquiry was held into an application of the Corporation for sanction to borrow £543,000 for the provision of a new generating station at Barton. It was explained that the increased demands were entirely due to engineering and other firms in the city for the manufacture of war munitions, and, with one exception, Manchester was supplying more current than any other undertaking for the manufacture of munitions of war. Mr. S. L. Pearce, the chief electrical engineer to the Corporation, said if the application were not granted, the undertaking would have to refuse any further increase in supplies of current. The application now was for sanction to borrow £432,000. The Corporation would postpone the carrying out of the work involving the balance of the amount. The inspector announced that his instructions were to amount. The inspector announced that his instructions were to deal with the Manchester Corporation's application at the earliest possible moment.

Middleton (Lancs.). — The annual accounts state that public lighting will next year require £2,326, a reduction of £200 on the year previous, and foreshadow the postponement of the proposed extension of electric lamps.

Oldham:—YEAR'S WORKING.—The profit of the electricity department for the past year, subject to audit, is £3,550 (or £1.555 more than in the previous year), and this, added to the reserve fund, brought that to £12,979. The reserve will have to be spent on extensions which are now being made, in consequence of the bar on new loans. Units sold during the year amounted to 7,985,000, an increase of 929 000 units and a record. The cost of production was '606d. per unit, compared with '634d. last year.

eterborough.—The T.C. has given Messrs. Aublet, Harry & Oo., of Westwood, permission to lay an electric cable to their works from those of Messrs. Werner, Pficiderer and Perkins, on condition that when the municipal mains are extended to the district the supply of current will be taken from the Council.

Plymouth.—YEAR'S WORKING.—The annual report of the electricity department on the Newport Street electricity undertaking of the Corporation to March 31st, shows a sale of 2,520,430 units, producing estimated receipts of £21,790, compared with 2,377,233 units sold, and £19,981 received in the previous year, an increase of £43,197 units in the consumption of current, and £1,808 in the receipts.

Rawtenstall. — STREET LIGHTING. — The T.C. has decided to light Booth Road, Waterfoot, by electricity, and the work is to be proceeded with at once.

Salford.—YEAR'S WORKING.—For the past financial year the total revenue of the electricity department amounted to £117,584 as against £111,412 in 1913-14. The total working costs, inclusive of £6,414 for energy purchased, amounted to £65 776; this comparing with £67,232 in the previous year when £3,162 was paid for purchased energy. The generating costs at Salford fell from '82d. to '76d. per unit in 1914-15. The gross profit for the two years 1914-15 and 1913-14, was £51,808 and £44,180, and net profit, £8,406 and £3,629 respectively. Some 20 646 000 units were sold, being about a million in excess of the previous year.

Southend-on-Sea.—The T.C. has granted a supply of current at 1½d. per unit to a consumer for power purposes in connection with a medical apparatus used for three hours daily for the treatment of tuberculosis of the akin. The current is to be used only between 6 a.m. and 6 p.m.

Southport.—The Council has approved a recommendation of the Finance Committee to increase the rates by 3d, in the £, and to increase the gas and electricity charges by 10 per cent.

South Shields.—A formal inspection of the extensions recently carried out at the electricity works (and described and illustrated on page 693 of the ELECTRICAL REVIEW) was made on the 19th inst. at the invitation of the chairman of the Electricity Committee. It was pointed out that two turbine plants of 3,500-kw. normal capacity had been put down in the space occupied by three reciprocating sets totalling 400-kw. capacity.

South Wales,—Wages Conference.—As the outcome of a conference between electrical contractors at Cardiff and Barry and the Electrical Trade Union, the following agreement has been arrived at:—Wages for electricians, cable jointers, and electrical fitters to be \$\frac{1}{2}\text{d}\$, per hour, with an increase to \$10\frac{1}{2}\text{d}\$, in November; wages of armature winders to be \$10\text{d}\$, with an increase to \$11\text{d}\$, in November.

Stafford. — Year's Working. — The report of the electricity department for the past year shows an increase of 250,000 units sold, bringing the total for the year to over a million. The revenue from all sources amounted to £7,194, an increase of £814, while the total expenditure was £3,562, as against £3,934 in the previous year. The Committee recommends that £1,000 be transferred to the depreciation fund, and £100 as a contribution to the gas department, leaving a gross profit of £2,444, an increase of £87 on 1914. In pursuance of the arrangement as to profit charing, the Committee recommends the payment of a bonus on the wages of the officials and workmen of the electricity department, of 14.6 per cent., as compared with 12.0, 100 and 11.7 per cent. in the three preceding years; it was decided that the maximum bonus in the electricity department should be 15 per cent.—Staffordshire Advertiser.

Wakefield.—STANLEY PROV. ORDER.—The Corporation is petitioning Parliament against the Stanley (Yorkshire) Electric Lighting Prov. Order, asking to be heard when the confirming Bill comes before the Committee. The Wakefield Corporation's locus is objected to by the promoters of the order, and the Court of Referees is to decide the point on June 9th.

Watford.—The B. of G. has decided to install an electric motor for driving the water pump at the Workhouse.

Willesden.—The L.G.B. has sanctioned the borrowing by the U.D.C. of £1,112 for the purpose of laying a feeder cable from Acton Lane sub-station to Craven Park. It is proposed to substitute a feeder pillar for the disconnecting boxes now in use on the cables at Craven Park; also to interview the L.G.B. with a view to obtaining authority to raise part of the loans, amounting to £20,000, for prospective mains and services, sanctioned by the Board in August last year. The Committee is to hold a special meeting for the purpose of considering the report presented by the electrical engineer on new terms for electrical bulk supply and an estimate for a new generating station, &c.

Ystradgynlas.—Prov. Order.—The report dealing with the Council's negotiations for the taking over of the plant of the Glantawe Electric Sapply Co., Ltd., states that the provisional order had been granted, but the B. of T. had included one or two additional clauses, which provided that the order should not come into operation until the termination of the war and at the time must be taken up within 15 months, the works to be transferred within the subsequent three years.

## TRAMWAY and RAILWAY NOTES.

Accrington.—The Committee has empowered the tramway manager to engage women conductors if the necessity arises, as many of the conductors have joined the Colours. Women conductors will be paid at the same rate as the men.

Ashton-under-Lyne.—The tramway authorities have refused to concede an all round increase of 1d. per hour to tramway employés.

The tramwaymen held a mass meeting on Sunday, at which it was decided to invite the authorities to submit the application to arbitration.

Bolton.—STRIKE.—On Saturday last the whole of the employés of the Corporation tramways came out on strike. A certain number of cars, about 30, were run on the first journey, after which not a single car was run during the day. The service was also stopped on Sunday and Monday, and neither the Bury Corporation nor the South Lancashire Co., who run into Bolton, took cars within the borough boundaries.

The Tramways Committee pa-sed a resolution instructing the general manager to arrange for certain services, and that in the event of any motormen or conductors refusing to carry out the orders to enable such cars to be run, their services in the tramways department be dispensed with. Motormen for extra time involved would receive about 3s. 8d. and the conductors 2s. 11d. to 3s. 4½d.; the men do not like the idea of working at night after starting about 4.30 in the morning. Since the outbreak of war 102 tramway employés have enlisted, while 51 left their employ to work in foundries, &c., making a total of 153 out of 450. The Tramways Committee has decided to make no payments to dependents of its employés who have not already enlisted. The Committee is at present paying £35 per week to dependents of employés who are with the Colours.

Burnley.—Female Labour.—A proposal to employ women as our conductors has been left in the hands of the chairman of the Tramways Committee and the tramway manager for investigation.

Continental.—Spain.—The Sociedad Hispano - Belge de Ferrocarriles, Mineria y Industria, is reported to be preparing plans in respect of a projected narrow-gauge electric railway between Fonsagrada and the Port of Ribadeo.

Darlington.—FEMALE LABOUR.—The T.C. has arranged for eight female conductors to be employed, owing to the tramway staff having been depleted by enlistmentr. They will work eight hours daily, and receive between 19s. and 20s. per week.

Glasgow.—Female Labour.—There are now 150 fully trained women acting as conductors of Glasgow tramway cars, and on Tuesday another 50 women started training under the direction of male conductors, so that by Saturday 200 females will be engaged at the duties.

The Tramway Committee has, by a majority, recommended that all soldiers and sailors while in uniform be allowed to travel on the cars at half fare, the minimum half fare to be \dd.

Halifax.—Tramway Accident. — A serious tramway accident occurred on Saturday night to a car travelling from Ovenden to Halifax, which left the track, turned round and toppled over on to its side. Between 20 and 30 passengers were so injured that they had to be removed to the Halifax Infirmary. The accident occurred at a sharp turn in the roadway where there is a steep gradient. The car was considerably damaged. The cause of the accident is not known.

Huddersfield.—YEAR'S WORKING.—The result of the past year's working of the tramway undertaking shows a surplus of £10,208, as compared with £8,800 in the previous year, after. allowing £13,707 for depreciation. Out of this surplus £8,400 is to be put to relief of rates.

India.—The Karachi Electric Tramway Co. has received a franchise to extend its tramway lines. The new line has been needed for some time and promises to be profitable. Actual construction probably will be delayed a short time, but owing to the war, labour is now cheap, and work probably will be undertaken at no distant date.—Far Eastern Review.

Japan.—At a recent meeting of the Tokyo City Electric Enterprise Investigation Committee one of the municipal officials stated that the receipts from the enterprises were not sufficient to meet the repayment of the municipal loans. The municipal authorities propose raising tram fares in the immediate future by at least 1 sen per ticket, and this has caused indignation among some sections of the citizens, who are backed up by prominent members of the City Assembly.—Far Eastern Revisio.

London.—L.C.C.—Although the strike on the Council's tramways still continues, there are signs that a settlement will not long be delayed. During the week the Council issued a demand that all drivers and conductors of military age should return their uniforms, and the inspectors of all depôts have been returned that no man is to be taken on again if he is slightly for instructed that no man is to be taken on again if he is eligible for instructed that no man is to be taken on again if he is engine from military service. The department has had many applications from suitable candidates above military age for the vacant positions, and, in addition to the old training depôt, four new training schools have been opened at which the new men are receiving the necessary training as drivers. Efforts are being made by the men's unions to bring about a settlement through the B. of T.

One of the Union officials has stated that it is highly probable that within a week or so some form of National service may be decided on and that the Council has taken the opportunity of getting rid of men who would in any case probably have to go

shortly

The Woolwich Arsenal tramway service is now in satisfactory operation, and the general services are being improved daily.

Manchester.-YEAR'S WORKING.of the tramway undertaking states that the total revenue was \$901.875, a decrease of £23,434 on the previous year. The balance, \$901.875, a decrease of £23,434 on the previous year. The balance, with bank interest, and after deducting working expenses and war allowances, amounted to £312,285, out of which £100,000 had been given to aid the rates. The aggregate length of single track open, including lines over which the Corporation had running powers, was 195 miles; percels carried numbered 1,236,500; and the total number of passengers was 202,768,420. Weekly allowances to employ 63 who have enlisted amounted to £1,316 and the collections on the cars for war funds have realised £11,286.

Preston.—Female Labour. — The Tramways Committee's application for female conductors has brought an extraordinary response. It is intended in the first instance to put 14 a15 women on the Ashton-on-Ribble section for probationary purposes, but it is probable that in due course the conductors on all cars
will be women. As learners they will be paid half rates, but as
qualified conductors they will start at the minimum rate for men,
viz., 5d. per hour.

Salford.—WAR BONUS.—The tramway men have decided to accept the Corporation's offer of a war bonus similar to that recently awarded by arbitrators at Newcastle. Regarding the employment of women on the cars, the men have decided to ask the Corporation to withdraw female labour, and they will endeavour to find a suitable supply of male labour for the cars. Should this endeavour be unsuccessful the men have decided upon the conditions on which they will be prepared to work with women.

South Africa.—ELECTRIC VEHICLES.—The South African General Electric Co., which is pushing the sale of electric vehicles in South Africa, has lately established a charging station and garage in Cape Town, where customers' cars can be charged and garaged.

South Staffordshire.—The Black Country tramwaymen have decided, by 72 votes to 62, to accept the bonus of 2a, a week offered by the companies. The men's demand was for an week offered by the companies. increase of 1d. per hour.

Whitworth.—The U.D.C. has decided that the Tramways and Electricity Committee be dispensed with for the present year, and that the work (if any) be done by the whole of the

## TELEGRAPH and TELEPHONE NOTES.

Jamaica.—To supply a need felt by the British Navy, a powerful wireless station is being built on the highlands of the Island of Jamaica, 3,000 ft. above the level of the sea.

A force of about 300 men has been working on the plant for two months. The new station is being constructed by the British Government, and no details as to its equipment or range have been permitted to become public, except that the plant will be a very powerful one with a long radius of action.

Nottingham.—As the result of experiments which they have been conducting, Mesers. Furse & Co, electrical engineers, have received a large Government contract for the supply of telephone mechanism, which, it is said, will ultimately amount to over £250,000. Hitherto these telephone parts have been a German minopoly, so that the contract may mean the establishment of a new industry in Nottingham.

Time Signals.—It is stated that arrangements are in working order for the daily transmission of a wireless time signal for the use of shipping in South African waters, through the medium of the Union Government wireless station at Slangkop.

Wireless Signalling on Railways.—Experiments are being conducted this week on a section of the London and South-Western Railway Co.'s system with five engines equipped with wireless signalling apparatus.

## CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—Melbourne.—June 15th. City Council. Four mechanically-fired boilers, one turbine-driven boiler-feed pump, two fuel economisers, circulating water pumps. City Electrical Engineer. Specifications from Messrs. Mollwraith, McEacharn & Co., Ltd., London, E.C.

June 30th. Victorian Railway Commissioners. One 13-in. centre lathe for turning or grinding commutators for traction armatures; one 9-kw. motor-generator and battery-charging accessories; four electric motors.

July 14th. Victorian Railway Commissioners. Supply of 60,000 flame are carbons for use in Ganz flame are lamps (Contract 28,811); aluminium feeder, insulators, feeder taps, and terminal anchoring and joint clamps, for St. Kilda-Brighton electric street railway (Contract 28,817).—Australian Mining Standard.

Sydney.—July 12th. Metropolitan Board of Water Supply and Sewerage. Two steam turbines and condensers at Ryše pumping station, for the Chatswood pumping plant. Secretary, 341, Pitt Street, Sydney.

July 19th. Council. Maximum-demand indicators. Specification (10s. 6d.) from Electric Light Department.

July 19th. Municipal Council. One or two 12,000-kw. turboalternators (Contract No. 363).* A copy of the specification can be obtained from the City Electrical Engineer, Sydney.

July 19th. Steel towers for 33 000-volt transmission line. Specification (10s. 6d.) at E.L. Department, Town Hall.

July 21st. N.S.W. Government Railways and Tramways Department. One 250-k.v.A. turbo-generator.*

ADELAIDE.—June 30th.*—Deputy P.M.G. 120 miles of outside distributing wire; 123 miles of insulated copper wire

July 7th.*—27,000 jointing alseves and 55 000 copper binders. -MELBOURNE.-June 15th. City Council.

ADELAIDE.—June 30th.*—Deputy P.M.G. 120 miles of outside distributing wire; 123 miles of insulated copper wire

July 7th. —27.000 jointing sleeves and 55 000 copper binders.

PERTH.—July 7th. Deputy P.M.G. 31.000 porcelain or alternatively stoneware insulators (Schedule 432 W.A.).*

Specifications for the items marked * can be seen at the B. of T. Commercial Intelligence Branch in London.

Dublin.—June 7th. Electric passenger lift for Irish United Assurance Society. See "Official Notices" to-day.

Dundee.—June 4th. Corporation Electricity Department. Reinforced-concrete floors and jointless flooring, required for the extension to Carolina Port generating station.

Eccles.—June 9th. Corporation. Installation of the electric light at the Anson Street Council Schools, Winton, of tender (10s.) from Mr. E. Parkes, Town Clerk, Town Hall,

Edinburgh.—June 21st. Two 5,000-kw. turbo-alternators and condensing plant, for Portobello supply station. See "Official Notices" May 21st.

Maintenance of the intercom-Edmonton.—June 1st. Maintenance of the intercommunication fire alarms at the various elementary schools in Elmonton for 12 months for the Education Committee. Architect, Town Hall, Lower Edmonton.

Finchley.—May 81st. U.D.C. Wiring, for light, 100 workmen's dwellings. See "Official Notices" May 7th.

Kirkcaldy.-June 14th. Corporation. 100 half-watt 1,000 o.p. lamps and lanterns for street lighting. See "Official Notices" to-day.

London.-L.C.C.-June 4th. Installation, 260 wiring

LONGON.—L.U.U.—June 4th. Installation, 260 wiring points, 345 lights, also electric bells, at the County Secondary School, South Hackney. See "Official Notices" May 21st.

St. Panchas.—June 14th. Corporation. Twelve months' supply of Welsh and steam coal for the electricity stations and baths.

West Ham.—June 14th. Installation of lighting and waterheating apparatus at Knox Road Special School, for Education Committee. See "Official Notices" to-day.

Manchester.—June 2nd. Corporation. Coal-unloading crane, conveying plants, &c. See "Official Notices" May 7th.

New Zealand.—Christchurch.—July 3rd. House service meters for the City Council. Specifications from the City Electrical Engineer's office.—New Zealand Shipping and Commerce.

Portsmouth. — June 1st. Corporation. 100 tons of steel girder tram rails, five tons of steel fishplates, one ton of fishplates, three tons of 5-ft, wrought-iron tie-bars. See "Official Notices" May 14th.

Rangoon.—August 11th. Installation of a system of fire-alarm, for the municipality. Specification (10s.) from Messrs, Ogilvy, Gillanders & Co., 67, Cornhill, E.C.

Redditch .- June 14th. H.T. three-phase switchboard. See "Official Notices" to-day.

U.D.C. Water-storage tank Rhondda.-June 4th. (30,000 gallons), for Porth Electricity Works. See Notices" to-day.

Tasmania. - LAUNCESTON. - July 26th. Sub-station equioment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

HOBART.—July 5th. Lead-covered telephone cables; glassware and other material for batteries; telephone instruments and parts,

including switchboards; iron work; various insulators; iron, steel, copper and bronze wire; india-rubber, gutta-perchs, cotton, silk or wool-covered wire; sleeves, paper jointing, &c., for P.M.G.'s Department. See "Official Notices" to-day.

Wigan. — May 29th. Corporation. H.T., three-core, paper and lead-covered, armoured feeder cable, transformer and switchgear. See "Official Notices" May 14th.

#### CLOSED.

Australia.—The following tenders have been accepted:-P.M.G.'s DEPARTMENT, N.S.W.

240 miles twisted pair, rubber-insulated wire, £14 10s. per mile.—British Insulated & Helsby Cables, Ltd.

P.M.G.'s DEPARTMENT, VICTORIA.

Accumulator battery, Tudor type, for Perth radio-telegraph station, £322,—
J. B. W. Gardam.

8 miles peper-insulated, lead-covered cable, 104 pairs, £392 per mile;
3 miles ditto, 39 pairs, £223 per mile.—British insulated & Helsby Cables, Ltd.

w, Ltd. Victorian Railways Department. (Blootrical equipment of Melbourne suburbau system.)

Track and line relays, £3,66?.—British Pneumatic Railway Signal Co., Ltd.
Track resistance, £1,547.—McKenzie, Holland & Westinghouse Power Signal

Co. 1.4d.

Volt feeder cables, volt track cables and accessories, schedules rates.—
British In-ulased & Helsny Cables, Ltd.

Overhead equipment of permanent way and overhead transmission mains, schedule rates.—British Insulated & He'sby Oables, Ltd.

Hard-drawn copper wire, at \$88 17s. per son.—British Insulated & Helsby Cables, Ltd.

MELBOURNE, BRUNSWICK AND COBURG TRAMWAYS TRUST.

B-LOOPE R.T. Cable, 21,182.—W. T. Fealey's Telegraph Works, Ltd.
Overhead material, £4,554.—G. H. Bishop, Brisish Insulated & Helaby
Cables, Ltd.; Lavceilas, Parrington, Australian General Electric Co.
Car equipmens, £5,619. Anstralian General Electric Co.
Bub-station equipment, £3,510.—Australian General Electric Co.—T. nders.

Bexhill-on-Sea. - The T.C. has accepted the tender of Messrs. Myere, Rue & Co. for 500 tons of Shipley Peas coal, for the electricity works, at &1 7s. 61. per ton.

Bradford.—The Guardians have accepted the offer of Mr. Charles Bell, at £33, for installing electric light at the Westbrook Lodge relief station.

Dover .- The T.U. received the following tenders for six electrical vehicles for scavenging :-

Glasgow.—The Tramways, Works and Stores Committee recommends acceptance of the following :-

Scrap copper cable, scrap motor field coils, scrap zinc.—P. and W. MacLelian, Ltd.

Scrap copper wire and bonds, scrap armature coils, scrap brass, brass duss, scrap lead, scrap rubber cable, scrap dry cells.—R. M. Easdaie & Co. Scrap lead-covered cable.—Trainer & Allison.

Brass turnings and borings, copper and mica turnings.—Pegler Bros. & Co., Ltd.

Cast-iron stopping-place sign posts.—D. King & Son; J. and A. Law, Ltd. Two 500-aw. rotacy converters.—British Westinghouse Co., Ltd.

The Corporation has placed a 12 months' contract for direct current house service meters with the British Thomson-Houston

Government Contracts.—The following tenders have been accepted during the past month by the Government Departments named :-

WAR OFFICE.

Telegraph pole arms.—Bullers, Lt1; S emens Bros. & Co.
Insulator bolus.—T. W. Lench, Lud.; Chas. Richards & Sons.
Battery boxes.—Accommistor Industries, Ltd.; Houghton-Butcher Mfg.
Co., Ltd.; Walters Electrical Mfsg. Co., Ltd.; Houghton-Butcher Mfg.
Risemens Bros. & Co., Ltd.

Electric cable and wire.—T. Bolton & Sons, Ltd.; T. W. Lench, Ltd.;
Biemens Bros. & Co., Ltd.
Electric cable and wire.—T. Bolton & Sons, Ltd.; H. Henley's Telegraph
Works Co., Ltd.; Hooper's Telegraph and India-Rubber Works, Ltd.;
R. Johnson, Ciapham & Morris, Ltd.; Johns n, Matthey & Co., Ltd.;
R. Johnson & Nephew, Ltd.: London Electric Wire Co. & Smiths, Ltd.;
Bhropshire Iron Co., Ltd.: Siemens Bros. & Co., Ltd.; F. Smith & Co.,
incorporated in the London Electric Wire Co. & Smiths, Ltd.;
Ward
and Goldstone.
Electric cells —Biemens Bros. & Co., Ltd.
Resistance col s.—Gambrell Bros., Ltd.; Mulrhead & Co., Ltd.; Nalder
Bros. & Thompson, Ltd.; R. W. Paul; W. G. Pye & Co.; Reid Bros.,
Engineers, Ltd.
Telegraph commutators and vibrators.—Edison & Swan United Electric Co.; Gall Telegraph

Resistance coils.—Gambrell Bros., Ltd.; Multhead & Co., Ltd.; Naider Bros. & Thompson, Ltd.; R. W. Paul; W. G. Pye & Co.; Reid Bros. Engineers, Ltd.

Telegraph commutators and vibrators.—Edison & Swan United Electric Lighs Co.; Gell Telegraph Appliances Syndicate, Ltd.

Electric cranes.—Babcock & Wilcox, Ltd.

Electric cranes.—Babcock & Wilcox, Ltd.

Electric etts, &o.—Austin Motor Co.

Galvanometers.—Edison & Hwan United Electric Lighs Co., Ltd.; India-Robber, Gutta-Percha and Telegraphs Works Co., Ltd.

Insulators —Litholite, Ltd.

Electric lamps. Brimadown Lamp Works, Ltd.; Cryselco. Ltd.; Efandem Co., Ltd.; General Electric Co.. Ltd.; India-Rubber, Gutta-Percha, and Telegraph Works. Ltd.; Omega Electric Lamp Co., Ltd.; Siemens Bros. & Co., Ltd.

Telegraph poles, steel.—Bayliss, Jones & Bayliss; Siemens Bros. & Co., Ltd.

Ditts. wood.—W. H. Beal: W. E. Chivers & Sus; Cuttans Steam Joinery Works; John Jaques & Sons, Ltd.; Map'e & Co., Ltd.; H. H. Martrn and Co., Ltd.; T. and S. E. Merredew, Ltd.; Venesta, Ltd.; D. Wishart & Co.

Electric light switches.—General Electric Co., Ltd.

Telephone a trand parts.—L ndon Electric Wire Co. and Smiths; Siemens Bros & Co., Ltd.; Walters Flectrical Mfg. Co., Ltd.; Western Electric Co., Ltd.; West London Scientiff Apparatus Co., Ltd.; Electrical wiring, Codford. Tredegar Ltd.

Electrical wiring, Codford. Tredegar Ltd.

Electrical wiring, Sutton Vener.—Girdlestone & Co.

Electric light installation, Cannock Chase, Mansfield, Oswestry and Rhyl.—Ellis & Ward, Ltd.

Electric light installation, Richmond.—Cox-Walkers.

India Preserve Co.

INDIA OFFICE: STORE DEPARTMENT.

Wireless apparatus.-Marconi Wireless Telegraph Co.

Cable.—Siemens Bros. & Co. Searchlights.—Chance Bros. & Co. Telephone parts.—Peel-Conner Telephone Works. Wire.—B.I. & Helaby Cables, Ltd.; T. Bolton & Sons, Ltd.; White Cross Co.

Wire.—B.I. & Helsby Cables, Ltd.; T. Bolton & Eons, Ltd.; White Cross Co.

Post Office.

Telegraphic apparatus.—Creede, Bille & Co.
Telephonic apparatus.—Antomatic Telephone Mfg. Co., Ltd.; Brit. L. M. kriesson Mfg. Co., Ltd.; Pronix Telephone and Electric Works, Ltd.; Western Electric Co., Ltd.; Pronix Telephone and Electric Works, Ltd.; Western Electric Co., Ltd.; Telephonic cable.—Johnson & Philips; Pirelli-General Cable Works, Ltd.; St. Helens Cable and Rubber Co., Ltd.; Western Electric Co., Ltd.; Stoneware ducts.—Albion Clay Co., Ltd.; Doulton & Co., Ltd.; Cates and Green, Ltd.
Insulator spindles.—T. W. Lench, Ltd.
Insulator spindles.—T. W. Lench, Ltd.
Laying ducts. Stockport.—W. H. Worthington, Ltd.
Laying ducts and 'pipes, Belvedere to Hop Exchange, S.E.—F. G. Brumme'l.
Telephone Exchange equipment, Huddersfield.—Peel-Conner Telephone Works, Ltd.
Telephone Exchange equipment extensions, East (London).—Western Electric Co., Ltd. Salisbury.—Peel-Conner Telephone Works, Ltd.
Kingston-on-Thannes.—The T.C. has accepted the

Kingston-on-Thames.—The T.C. has accepted the tender of the Anglo-American Oil Co., Ltd., for 1,400 tons of fuel oil for Diesel engines for two years, at £3 5s. per ton.

London. - STEPNEY. - The Electricity Committee reports the purchase of 6 270 tons of coal for the electricity undertaking at prices ranging from 21s. 6d. to 24s. a ton, and has accepted the offer of Messrs. E. Fuster & Co. for 3,000 tons of Bestwood Washed Peas, at 21s. 6d. per ton, in weekly quantities of about

HACKNEY.—The Electricity Committee recommends the BC. to enter into a sole-use contract with the Electrical Apparatus Co., Ltd., for the supply of direct-current house type meters, as may be required, up to and including 25 amperes capacity, for one year,

Spain.—The Spanish Ministry of Marine has recently placed a contract with the Sociedad Espanola de Construccion Naval for the establishment of an electricity generating plant at the State Artillery and Projectile Works at La Carraca for lighting and power purposes.

Tasmania.—The Mount Lyell M. and R. Co., Ltd., has entered into a contract with the British Insulated and Helsby Cables, Ltd., for the sale to them of 250 tons of electrolytic copper (E.S.A. brand) monthly.—Tenders.

## FORTHCOMING EVENTS.

Physical Society of London.—Friday, May 28th. At 8 p.m. At King's College, "trand. Papers on "Numerical Relations Between Eleosronic and Atomic Constant," by Dr. H. 8. Allen: "A Method of Calculating the Absorption Coefficients of Homogeneous X-Madistion." by Mr. H. Moore; "Two Experiments Itustrating Novel Properties of the Electron Currents from Hos Metals," by Prof. O. W. Richardson, F.R.S.; "Bigh Permeability in Iron," by Prof. E. Wilson.

Royal Institution of Great Britain,—Friday, May 28th. At 9 p.m. At Ab mail Streat, W. Paper on "Engineering Problems of Mesopotamia and Emphrates Valley," by Sir J. Jokson.

Friday, June 4th. At 9 p.m. Paper on "Radiation from Exploding Atoms" by Prof. E. Rutherf rd, F.R.S.

Ronigen Society. Tuesday, June 1st. At 8.15 p.m. At Cancer Hosnital.

Rontgen Society. Tuesday, June 1st. At 8.15 p.m. At Cancer Hospital, Fulham Road, S.W. Annual general meeting.

Thermal Insulation Tests of Electric Ovens.recent issue of the Electrical World contained some particulars of an investigation into the resistance to heat offered by five different kinds of oven wall, the oven in question being one used for electrical work at Harvard University, rectangular in shape with walls composed of asbestos board. A summary of results from the Various tests is given below:

Series	Nature of wall.	Deg. C. r se per wast input.	Thermal resistance ratios.		
1	Single shell	0.0224	1		
2	Double shell and simple air space	0.0410	1.62		
3	Double shell and cellular air	0.0410	1.65	1	
4	Double shell packed with cotton waste	0.0602	2.38	1'47	
	Double shell packed with metal-	0.0779	3.04	1.9	

The oven measured externally 63 in. × 41 in. × 44 in., and internally, 56 in.  $\times$  34½ in  $\times$  35 in. (approximately). It was found that after seven or eight hours from the commencement of heating, the rate of rise of internal temperature was sufficiently small or enable heat input to be taken as heat leakage without serious error.

The ovens provided with double walls, containing a simple air space between them, showed about 60 per cent. more thermal re-

sistance to the escape of heat than a single wall, after a steady input for from seven to eight hours. Inserting a few horizontal wooden strips into the walls to break up the air space into compartments had no appreciable effect. Packing the hollow walls with loose dry cotton waste increased the double-wall thermal resistance nearly 50 per cent, and packing with a loose fixculent mineral substance nearly 90 per cent. The latter substance is procured in Indiana, and is fused and blown out with com. pressed air.

## MAIN-MOTOR-STARTING SWITCHGEAR USED ON MODERN GERMAN SUBMARINES.

## BY NORMAN H. WOOD.

OWING to the exigencies of service to which a modern oceangoing submarine boat is exposed, and the fact that the machinery used to submerge the boat and propel it when submerged must be absolutely reliable, every effort is made to install apparatus which is effective and yet extremely simple.

On the surface a submarine is propelled by means of internal-combustion engines using crude oil, but when diving

and running submerged the boat is driven by powerful 0-400 VOLTS LS TO CHARGE THE SATTERIES FROM DURCE OUTSIDE THE SUBMARINE COPPER 800 FIRM COPPER 960 mm TOMATIC OVERLOAD GUT-OUTS FITTED WITH TIME RELAYS --/WWW 4WWW annamananana <del>mmmmm</del>m FIELD WITH PARALLEL RESISTANCE

DIAGRAM OF CONNECTIONS OF MOTOR-STARTING SWITCHGEAR.

electric motors and maintained at the desired depth by means of diving rudders or hydroplanes. Should, however, the main motors or their starting switchgear break down when the boat is running submerged, the diving action of the hydroplanes becomes nil, and the submarine, due to its reserve buoyancy, will immediately rise to the surface, thereby becoming a helpless target for the guns or ram of an enemy warship having a greater surface speed than itself.

460 B.H.P., 350 R P.M., 225 VOLTS, 1670 AMPS

These motors receive their current from a large storage battery usually placed amidships, and on modern German submarines the starting gear is of a very special type, the peculiarity being that the starting rheostat has been entirely eliminated. Experience has shown that these rheostats, even when immersed in oil, are very unreliable. Further, they occupy a large space and are very heavy.

The starting switchgear adopted by the German Navy

is shown on the accompanying diagram.

The battery consists of 4 units of 60 cells each, arranged in series-parallel, and any one unit can be cut out by means of the isolating links. The cells are of a special type designed to withstand repeated momentary shorts without appreciable damage. The individual plates are of lead, the positives being of the high surface type whilst the negatives are pasted. The containers are of special vulcanite and are perfectly watertight, with a space of 60 mm. allowed between the lower edges of the plates and the container-bottoms to receive any mud that may accumulate. Grooved wood separators are inserted between the individual plates. The boat can assume an inclination of 25° in any direction without the acid running out of the containers.

The motors are of the shunt-wound double-motor type.

fitted with interpoles and compensating windings. Each main motor has two armatures mounted on the same shaft, with two distinct but equally proportioned fields of eight poles each, whereby each armature at full load exerts half the total output, viz., 225 в.н.р.

The shunt fields are arranged in series, with a non-inductive resistance in parallel to provide a shunt discharge path when the current in the fields is switched The whole mounted together to form one complete unit.

The starting switchgear is of the open type, and consists of quickchange-over breaking knife switches with auxiliary breaking-contacts, the whole being mounted on slate baseplates secured to angleiron frames, with the connections taken off at the back.

The cables are leadcovered and armoured with interwoven flexible galvanised-steel wires.

Starting Ahead " for the position effected as follows :-

1. Switch A is moved up, switch D down, and the automatic overlead cut-outs are inserted, when a current is immediately sent through the

It is thus impossible to start up the motors on windings.

DARD MAIN PROPELLING MOTOR 450 B.H.P., 350 R.P.M., 225 VOLTS, 1670 AM

an open field. 2. Switch B is placed up and switch c down, when a very heavy impulse current, about 4,000 amperes, is sent through the two armatures in series, which at once commence to As this heavy current is only momentary, the time limits, which are set for about 3 seconds, prevent the cutouts from operating.

3. By means of the shunt regulator the speed is increased to the utmost, when the shunt resistance is quickly cut out

and switch c placed up, whereby the armatures are in series across the full battery pressure.

4. By means of the shunt regulator the speed is again increased to the utmost, the shunt resistance quickly cut out and switch D moved up, thus placing the armatures in parallel across the full battery pressure.

The speed can now be adjusted at will by means of the shunt regulator. With this arrangement continuous regu-

lation from 80 up to 350 R.P.M. is possible.

To reverse, switches A, B, C and D are opened, A is placed down and the other switchings are carried out as above.

As the time limits are set to operate at about 3 seconds the cut-outs are fully effective on a prolonged overload, but as an additional safeguard single-pole fuses are placed in the armature circuits.

This switchgear is usually placed in the boat as near the main motors as possible, and is provided with the necessary number of ammeters and ampere-hour meters of the mercurymotor type, to enable the officer in charge to read off the condition of the battery-units and, incidentally, to check their efficiencies.

The battery can only be charged when the boat is on the surface, the motors being driven as dynamos by the oil engines, but special terminals are provided to enable the battery to be charged with its sections in series or parallel from a source outside of the submarine, such as the parent boat or dockyard plant.

The capacity of the battery is so rated as to enable the main motors to give their full outputs for 11/2 hours, thereby imparting to the boat a submerged speed of about

10 knots.

#### NOTES.

The Engineering Institutions' Volunteer Training Corps.—A meeting was held at the Institution of Electrical

Corps.—A meeting was held at the Institution of Electrical Engineers, on Thursday last week, to inaugurate the Engineering Institutions' Volunteer Training Corps, the formation of which was foreshadowed in these columns recently. Sir John Snell, President I.E.E., occupied the chair, and there was a good attendance. The President announced that the Corps had been formed at the request of General Sir O'Moore Creagh, V.C., military adviser to the Central Association of Volunteer Training Corps, who had nominated Col. C. B. Clay, V.D., as Commandant, and he referred to the presence at the table of Mr. H. C. Gunton, Power Engineer to the Post Office and Commandant of the Post Office Engineering Volunteer Training Corps, and engineering adviser to the Central Association, whose experience in Territorial and Engineering Volunteer Training Corps, and engineering adviser to the Central Association, whose experience in Territorial and Volunteer organisation would be valuable to them. He hoped the I.E.E. would form a nucleus which members of other Engineering Institutions would join; when the London unit had been organised, it was hoped that the Local Sections would form similar units in their respective areas. The Corps would have the cordial sympathy and support of the Council of the Institution, and it might be possible to contribute to its equipment from the Institution funds, should that he found necessary.

funds, should that be found necessary.

Col. Clay proposed that Sir John Snell, who had already done a great deal for the Corps, should be invited to become its Hon. Commandant, and this proposal having been heartily endorsed by the meeting, Sir John said he had great pleasure in accepting the appointment. He then vacated the chair, and Col. Clay read a letter from General Sir O'Moore Creagh, who, after expressing his pleasure on the acceptance by Col. Clay of the position of Commandant of the Corps, said:—

"The formation of engineering units is of the greatest importance if the Volunteer organisation is to be satisfactorily compeleted.

and the Volunteer organisation is to be satisfactorily completed, and the members of your unit should be eminently suitable for carrying out work corresponding to the several branches of the work of the Royal Engineers. I understand that in addition to Telegraph, Telephone and Searchlight Detachments, you propose to furnish detachments that can manipulate emergency lighting telegraph, felephone and Searchinght Detachments, you propose to furnish detachments that can manipulate emergency lighting sets, and also detachments that would be prepared to undertake emergency work in power stations in case of damage by bombs or other causes. I consider that the number of engineers who could be usefully employed on work of this nature is practically unlimited, and would be of the greatest service." Col. Clay proceeded to express his indebtedness to the assistance of Mr. Gunton, and read a letter received by the latter from Birmingham describing the work that was being done by the Birmingham electrical Volunteer Force, of which particulars were given in our issue of March 5th, 1915, p. 341. He stated that it was not proposed to limit membership to the engineering societies. Mr. Gunton had offered them the use of the Inns of Court Hotel for drill purposes, and, with his adjutant, Mr. G. F. Preston, would provide them with instructors from the Post Office Corps. Other places where they might drill were mentioned, including the Headquarters of the Lindon Electrical Engineers (Territorials), where Col. Le Rossignol had kindly offered to afford them facilities.

Members of other volunteer corps could join by arrangement with their commandants for transfer; and it was thought

that special constables might be able to join the corps. He regretted that as no form of attestation was permitted by the War Office, they could not share the work of the Regulars at present. An entrance fee of 5s. and a subscription of 5s. a quarter were suggested; the uniform would cost about 30s. They must begin with squad drill and company drill, and flag signalling; their technical work would embrace telegraphs and telephones, searchlights, trench work, wire entanglements, mining, temporary lighting, and, perhaps, wireless telegraphy. They might also be employed in semi-military functions, such as lighting camps, &c.

Mr. Gunton pointed out that in the early days the assistance of

functions, such as lighting camps, &c.

Mr. Gunton pointed out that in the early days the assistance of the Post Office Corps might be very useful to the new body, the former having obtained the loan of telegraphic apparatus and tools. It was important that eligible men who were not permitted to enlist should nevertheless be trained, ready to enter the Royal Engineers in a semi-trained condition in case of need. In his opinion the Volunteer movement encouraged recruiting for the Army, and there was plenty of scope for the corps.

Many questions were asked and answered, and it was agreed to commence drill on Wednesday next week, at 6.30 p.m. Saturday afternoons will also be taken, and other days will be arranged to as required. The meeting concluded with a hearty vote of thanks

as required. The meeting concluded with a hearty vote of thanks to Sir John Snell, Col. Clay, and Mr. Gunton for their work in forming the corps.

It was suggested during the meeting that many engineering firms would be glad of the opportunity to assist in equipping the cores with apparatus, and arrangements will be made to this end.

We are informed that drills will be held on Mondays, Wednesdays and Fridays at the Headquarters of the London Electrical Engineers, 46, Regency Street, S.W., starting on Wednesday, June 2nd.

Australia and Preference.—At a meeting held in Australia and Preference.—At a meeting neid in April at Melbourne by the Victorian Chamber of Manufactures a communication was received from the Western Australian chamber asking for the views of the Victorian Chamber regarding the following recommendation from the New South Wales Chamber:—
"That this Council heartily approves of the extended preference to the Mother Country given in the latest tariff, and urges upon the Federal Government the desirability of the Commonwealth also comprising trade reciprocity with the Dominions, and a fixed minimum surpharse of 25 per cent for ten years upon all goods minimum surcharge of 25 per cent. for ten years upon all goods made in Germany. That the foregoing resolution be forwarded to the Associated Chamber of Manufactures of Australia for submission to the Federal Government."

According to the Melbourne Age the executive of the as

chambers was to consider the question contained in the New South Wales recommendations a few days later. The executive of the Victorian Chamber, together with the executive of the New South Wales Chamber, took steps at the beginning of this year to urge action somewhat in the direction indicated.

We are indebted for the foregoing information to an esteemed electrical correspondent in Victoria who is auxious that we should be kept informed in this country respecting the growing feeling in the different Australian States regarding the need for a prohibitive duty against German manufactures.

Heavy Mechanical Road Traffic.—The Departmental Committee recently appointed by the President of the Local Government Board to consider the law and regulations relating to the construction and use of road locomotives and heavy motor-cars in Great Britain has commenced to take evidence. Communications hould be addressed to the Secretary of the Committee, Mr. R. J. Simpson, Local Government Board, Whitehall.

Industrial Electric Heating.—An Industrial Electric Industrial Electric meaning,—an image of the second to the conmerican namesake quotes the following preamble to the conmeritanian showing the aims of the organisation:—"Recognising American namesake quotes the following preamble to the constitution, showing the aims of the organization:—"Recognising the opening of a new and heretofore undeveloped field in the electrical industry, the importance of which, and the possibilities for the development of which, are so great, and the present knowledge so small, it seems imperative that an organisation should be perfected to study and gather together all the available information on this great subject for the benefit of its members and of the industry at large and for the exchange of ideas and data."

Electric Light and Fans in German Trenches The Times special correspondent in Northern France states that the trenches taken from the enemy east of La Quinque Rue and Rue d'Ouvert were fitted with electric light and fans, and with mechanism worked by electric power for draining them. "The necessary power was obtained from electric plant at the coalmines in the La Basiée area. In one trench our men profited for several hours by the electric light, but eventually the enemy severed the wires and so cut off the current."

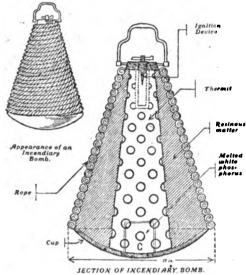

Removal of Rust.—In a paper read before the Iron and Steel Institute at the recent annual meeting, Messrs. J. N. Friend and C. W. Marshall described experiments on the quantitative removal of rust from iron by chemical reagents. Various solutions were tried, but none was found that would remove rust without also dissolving some of the iron. One of the best reagents. without also dissolving some of the iron. One of the best reagents, acting quickly on the rust but very slowly on the iron, was borio acid; a saturated solution cleaned rusty plates in a day or two, after which very little loss in weight of iron courred. A 10 per cent solution of aluminium sulphate cleaned the iron in 24 hours and yielded an excellent metallic surface. Sodium citrate, which had often been recommended, acted very slowly, a 20 per cent. solution taking four days to clean the iron; it gave a beautiful surface, but the iron continued to dissolve during the whole period of immersion.  $i^{\mathcal{I}}$ ;

2

Air Raids and Fire Prevention. - An excellent "Warning" leaflet, No. 17a, has been issued to the public by the "Warning" leaflet, No. 17A, has been issued to the public by the British Fire Prevention Committee, containing a description of the bombs used by enemy aircraft, and the best steps to take to deal with fires resulting from their use. Copies can be obtained from the Committee at 8, Waterloo Place, Pall Mall, S.W., on application By kind permission of the Committee, we are enabled to reproduce a sectional drawing of the incendiary bombs, which, it will be seen, are exceedingly well calculated to ignite anything of an inflammable nature within their range.

The bomb, as a rule, is conical, corded round; the base is a flat cup, on which a pierced metal funnel is fitted, having the ignition device and handle attached at the top.

tion device and handle attached at the top.

The funnel is generally filled with thermit, which upon ignition generates intense heat, and by the time of the concussion, has taken the form of molten metal at a temperature of over 5,000° F. The molten metal is spread by the concussion.

Outside the funnel is a padding of a highly infiammable or resinous material, bound on with an inflammable form of rope. The resinous material creates a pungent smoke.

There is generally some melted white phosphorus in the bottom of the cup, which develops nauseous fumes, and in some cases celluloid chippings are added, and occasionally a small quantity of petrol.

The best means of combating the flames produced by these infernal devices is to apply a stream of water from a series of buckets or a hose—single buckets of water are of little use, and sand has not the necessary cooling effect. Damped respirators should be worn to prevent breathing the pungent fumes. Gas and electricity supplies should be cut off at once.

Explosive bombs seldom cause fire

Institution and Lecture Notes. - Diesel Engine Users' Association.—At the May meeting of the Association, it was agreed that a member unable to attend a meeting on any particular occasion should be entitled to nominate a deputy to attend in his place. The question of a suitable allowance to be made for depreciation of Diesel engine plant in connection with income-tax assessment was discussed, and its further consideration was adjourned. The subject of lubrication of Diesel engines was further dealt with. Information on several interesting points had been received from many of the members of the Association, and it was decided to extend the time for sending in returns from other undertakings and to ask for further information in certain These returns will then be tabulated and circulated among

cases. These returns will then be tabulated and circulated among the members only. The next meeting of the Association is to be held on Wednesday, June 16th, when the question of cracked pistons will also come up for discussion.

Institution of Electrical Engineers.—The annual general meeting of the YORKSHIBE LOCAL SECTION was held at Leeds, on May 12th; Mr. T. Roles occupied the chair. The annual balancesheet and report were presented and adopted. The following officers and members of the Committee were elected for the ensuing year:—Chairman, Mr. H. Hodgson Wright (Halifax); Vice-Chairmen, Mr. H. A. Neville (Wakefield), and Mr. W. Lang (Leeds); Hon. Seo., Mr. Jno D. Bailie (Leeds); Committee, Messra. R. H. Campion (Dewabury), W. M. Selvey (Sheffield). O. J. Jewell (Wakefield), P. J. Pybus (Bradford), J. E. Storr (Leeds), and E. C. Wallis (Leeds).

The annual general meeting of the contributors to the I.E.E. Benevolent Fund was to be held yesterday to receive the report and

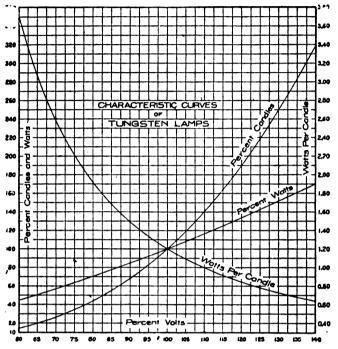

Benevolent Fund was to be held yesterday to receive the report and

statement of accounts for 1914.

Association of Mining Electrical Engineers.—At a meeting in Dunfermline of the East of Soutland branch, office-bearers were appointed as follows:—President, Mr. W. A. Wilkie, Cardenden; Vice-President, Mr. D. Beverldge, Kelty; Secretary and Treasurer, Mr. Bobert W. Peters, Locbgelly. A discussion took place on the "Use and Abuse of Oils on Mining Plant and Bearings of Electrical Mechanisms."

Electrically-Driven U.S. Warship.—The Journal of Commerce (Liverpool) states that the General Electric Co., of New York, will, according to an official announcement, supply the electric propelling machinery for the new U.S. battleship California for £86,200. The California is under construction at New York Navy Yard, which submitted an estimate of £126,200 for a steam equipment,

Tungsten-Filament Lamp Characteristics.—One of the greatest difficulties in photometry arises from the differences in the colour of light from different sources, which cause the personal element to assume excessive importance, as no two observers agree exactly in their judgment as to when two colours viewed in the photometer are of equal intensity. Hence in accurate work it is necessary to average a large number of observations made by different persons in order to arrive at a reliable result. By varying the temperature of the filament of a standard tungsten large in the provided to obtain a wide range of colours which can be lamp, it is possible to obtain a wide range of colours which can be matched with the colours of the lamps under test, and when the candle-power of the filament corresponding with each temperature has been determined, the process of comparison is greatly simplified.

CHARACTERISTIC CURVES OF TUNGSTEN LAMPS.

This subject has been investigated by Mesers. G. W. Middlekauff and J. F. Skogland, whose results are given in the Scientific Papers of the U.S. Bureau of Standards. The authors find that all vacuum tungsten lamps (100 to 130 volts), over a wide range of wattage, have the same voltage-current-candle-power characteristics, independently of the method of manufacture, and the or wates, and the same voltage-current-candie-power cursites relations between these three factors can all be accurately expressed by one general equation of the form  $y = A x^3 + B x + C$ , where  $x = \log$  voltage,  $y = \log$  candle-power, log wattage, log current, or log watts per candle, and A, B, C are constants, the values of which depend upon the significance of y. The equation expresses the voltage-candle-power and the voltage-watts per candle relations to well within 0.3 per cent., and the voltage-wattage relation to well within 0.05 per cent. of the observed values over the range from 0.7 to 3.3 watts per candle, the latter limit extending beyond the watts per candle corresponding to colour match with 4-watt carbon lamps. It is therefore possible, after carefully standardising a tungeten lamp at colour match with 4-watt carbon primary standards, to calculate with a high degree of precision its candle-power, voltage and current at any desired watts per candle or colour within the range above-mentioned. Thus all measurements can be made at colour match without the use of colour screens. without the use of colour screens.

To avoid the necessity of making tedious calculations, the authors give tables which enable the change to be made from one efficiency to another with an ordinary slide rule. The characteristic curves of lamps of sizes 25 to 100 watts at 100-130 volts, taking normally 12 watts per candle, are shown in the accompanying figure.

Coal Supplies Conference. — As a result of the National Conference on Coal Supplies to Gas and Electricity Undertakings, a deputation attended before the Coal Exports Control Committee, on the 20th inst., and laid the views of the Conference before it. The deputation consisted of Sir Corbet Woodall, Past President of the Institution of Gas Engineers and Governor of the Gas Light and Coke Co., Sir John Snell, President of the Institution of Electrical Engineers, Alderman Phillips, chairman of the Salford Corporation Gas Committee, Alderman Kay, chairman the Salford Corporation Gas Committee, Alderman Kay, chairman of the Manchester Corporation Gas Committee, Mr. Frank Bailey, chief engineer of the City of London Electric Lighting Co., Ltd, Dr. Charles Carpenter, chairman of the South Metropolitan Gas Co., Bailie Smith, chairman of the Glasgow Corporation Electricity Committee, Mr. Reginald Neville, M.P., chairman of the Brentford Gas Co., Mr. Hanbury Thomas, managing director of the Sheffield Gas Co., Mr. J. S. Highfield, chief engineer of the Metropolitan Electric Supply Co., and Mr. D. Milne Watson, general manager of the Gas Light and Coke Co.

**Educational Notes.**--University of London.-Senate last week resolved that the science department of Gold-smiths' College should be closed as from the end of the present session. It was also resolved that the East London College, previously admitted as a School of the University for limited periods, should be continued as a School of the University in the faculties of Arts, Science, and Engineering without further limitation of estion.

BRISTOL UNIVERSITY.—The Council has decided to commence the erection of new buildings, for which a total sum of £220,000 has been presented by Messrs, G. A. and H. H. Wills.

MANCHESTER SCHOOL OF TECHNOLOGY.—Ten research scholar-technology with fees remitted topple.

MANCHESTER SCHOOL OF TECHNOLOGY.—Ten research scholar-ships in technology, value £80 to £50, with fees remitted, tenable during the session 1915-16, will be awarded on July 5th, 1915. Applications must be received by June 21st. Particulars can be obtained from the Registrar. The scholarships are open to graduates of any University in the British Empire, and to other persons possessing special qualifications for research.

Appointments Vacant.—Borough electrical engineer (£400) for West Hartlepool; charge engineer (30s.) for St. Albans Electricity Works. Particulars are given in our advertisement

Fatality.—Sergt.-Major Thompson, 11th Welsh, at the Seaford camp, aged 35 years, who was, before he joined the Colours, in the clerical department of the Swansea electricity station, was returning to camp just before midnight recently when he was accidentally run over by a motor-car, receiving internal injuries from which he succumbed shortly afterwards.

Domestic Electric Service at Hendon.—In connection with their efforts to extend the domestic uses of electricity, the Hendon Electric Supply Co., L'd. have arranged with Mrs. Maud Lancaster to give a series of demonstrations of various domestic electric appliances. The first of these demonstrations will take place on Tuesday next at St. Alban's Hall, Golder's Green. At 3.30 o'clock a lesson in cooking economical French dishes will be given by Mrs. E. Lewis, and it is after tea that Mrs. Lancaster will begin her explanations to ladies and their cooks.

#### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The Luton Electricity

Committee proposes to raise the salary of Mr. R. Harding, chief clerk, from £120 to £130 per annum.

The Bexhill-on-Sea T.C. has appointed Mr. S. R. Burton, renior shift engineer, to succeed Mr. R. N. Smith (who has enlisted) as consumers assistant, at £2 per week.

Tramway Officials.—Mr. F. Freshwater, manager of the Imperial Tramways Co., L'd., Stockton-on-Ters, and his wife, have been presented by the staff with an inscribed solid silver tea and coffee service on the occasion of their silver wedding.

Mr. John Cameron, Jun., a son of Mr. John Cameron, manager and secretary of Blackpool and Fleetwood Tramroad Co., has been appointed manager of Northampton tramways at a commencing ralary of £350 a year. For some years Mr. J. Cameron, jun., has been borough electrical engineer of Northampton.

General.—The Times states that the Trustees Columbia University, in the City of New York, have awarded the Barnard Gold Medal to Prof. W. H. Bragg, F.R.S., Cavendish Professor of Physics in the University of Leeds, and his son, Mr. W. L. Bragg, Fellow of Trinity College, Cambridge, and a member of the College staff, at present holding a commission in the Leicestershire R.H.A. (T.F.), for their works on X-rays and crystals.

The Albert Medal of the Royal Society of Arts for the current year has been awarded to Prof. Sir J. J. Thomson, O.M., D.Sc., LL.D., F.R.S., for his researches in physics and chemistry, and their application to the advancement of Arts, Manufactures, and

Commerce.

MR. H. R. P. GIBBS, late chief electrical engineer in Mysore, and now the scientific head of the Tata hydro-electric scheme, has been appointed consulting electrical engineer to the Government of Mysore, the position of chief engineer being still in the hands of MR. S. G. Forbes.—Indian Engineering.

MR. ALEXANDER MACKENZIE has been appointed president of the Brazilian Traction, Light and Power Co., and its allied companies, to fill the vacancy caused by the death of Dr. F. S. Pearson through the Lusitania disaster. Mr. Macketzie has been closely associated with the Rio de Janeiro Tramway, Light and Power Co. and the Sao Paulo Tramway, Light and Power Co. from their incention and for many years acted as general and legal representations. inception, and for many years acted as general and legal representative of the companies in Brazil.

The Prime Minister has written to Sir Edgar Speyer, informing him that the King is not prepared to accept his resignation of the marks of distinction received in recognition of public services and philanthropic munifixmes. Mr. Asquith says he has known Sir Edgar long and well enough to estimate at their true value the "baseless and malignant imputations" upon his loyalty to the British Crown. Sir Edgar left Liverpool on Wednesday to spend a brief holiday in the States.

The Electrical Review and Western Electrician states that MR. THOMAS A. EDISON has been voted the American who has done the most to benefit mankind, and is to receive the Civic Forum Medal of Honour for distinguished public service. The medal, which was established to give recognition upon the part of the rank and file of the American people to that one of their countrymen who in ways of peace performed some signal public service, was first awarded last year, Colonel George W. Goethals being the

Obituary.—Reuter's Paris correspondent announces the death of M. PIERBE MARTIN, the inventor of the Siemens-Martin process of manufacturing steel. The Iron and Steel I estitute conferred the Bessemer Gold Medal upon M. Martin last May.

M. GEORGES DARY.—We regret to record the death of M. Georges Dary, who was for many years associated with our contemporary L'Electricien, of Paris, which has not yet been able to resume publication owing to the absence of M. Montpellier, the proprietors, and all the staff on military service. M. Dary, who has been an occasional, but valued, contributor of the ELECTRICAL REVIEW in executive and all the staff on military service. recent years, underwent an operation a short time ago at Toulouse. It was his intention, immediately after recovery, to place before our readers his views regarding the future prospects for electrical industry in France, but, unfortunately, it has been willed otherwise. He had two sons serving with the French Forces, one of whom was, we believe, taken prisoner some months ago. M. Dary's sentiments were always most cordial towards this country, and he believed most completely in the ultimate crushing of the enemy by the Allies. We tender to the family our sincere sympathy in the great loss that they have sustained.

### NEW COMPANIES REGISTERED.

Highfield Syndicate, Ltd. (140,408).—This company was registered on May 20th, with a capital of £5.000 in 4.875 cumulative preferred ordinary shares of £1 each and 5.000 deferred ordinary shares of 6d each, to adopt an agreement with F. W. Highfield, to develop and turn to account the patents referred to therein, to carry on the business of precipitating or condensing dust, metallic or other particles, furme vapours, and volatilisation products, electric and general smelting and refining, etc. The subscribers (with one preferred ordinary share each) are: F. H. Haviland. Thurnham, Lowther Road, Bournemouth, solicitor: W. A. Maslom, 15, Old Christchurch Road, Bournemouth, solicitor: Private company. The number of directors is not to be less than two or more than seven; the first are F. H. Haviland and F. W. Highfield, Qualification, £100 preferred ordinary or £2 10s, deferred ordinary shares. Solicitor: W. A. Maslom, 15, Old Christchurch Road, Bournemouth.

FECO. Rattery. Co. Ltd. (140,389) This company was

Ecco Battery, Co., Ltd. (140,389).—This company was registered on May 19th, with a capital of £12,000 in £1 shares, to adopt an agreement with T. Hill Jones for the acquisition of the property referred to therein, to carry on the business of electrical engineers, agents, factors, warehousemen, manufacturers, dealers, importers and exporters, etc. The subscribers (with one share each) are: M. Wolff, 19 & 21, Fore Street Avenue, E.C., merchant; A. J. Mardlen, 84, Milton Street, E.C., merchant. Private company. The number of directors is not to be less than three or more thar six; the first are M. Wolff, A. J. Mardlen, M. H. Goldstone, T. H. Jones, T. M. Jones, and T. A. Taylor (all permanent). Qualification, 500 shares. Remuneration, £50 each per annum. Registered office: Invicta Works, Bow Common Lane, E.

General Cable Manufacturing Co., Ltd. (140,879).—This company was registered on May 18th, with a capital of £6,000 in £1 shares to carry on the business of cable manufacturers' merchants, factors, dealers, agents, purchasers and vendors, in England and elsewhere, etc. The subscribers (with one share each) are: Hans Ochsenbein, 15, Garlick Hill, E.C. cable merchant; J. Wright, 2, Wood's Villas, Swanley, Kent, engineer. Private company. The number of directors is not to be less than two more than five; the first are J. Wright and G. E. Pullen. Qualification, £5. Remuneration of chairman, £10 per annum; of others, £5 each per annum. Solicitors: Sparks, Whitehouse, Russell & Co., 32, Walbrook, E.C.

Solicitors: Sparks, Whitehouse, Russell & Co., 32, Walbrook, E.C.

Anglo-Chinese Engineers' Association, Ltd. (140,361).—
Registered May 17th, by Stileman & Co., 110, Leadenhall Street, E.C. Captal £33,750 in 5,000 six per cent. cumulative preference shares of £10 and 75,000 deferred shares of 1s. each. Objects: to carry on in China or elsewhere the business of ironfounders, mechanical engineers, manufacturers of agricultural instruments and other machinery, tool makers, metal workers, boder makers, millwrights, machinists, iron and steel converters, smiths, builders metallurgists, electrical and water supply engineers, gas makers, agents, metahlurgists, electrical and water supply engineers, gas makers, agents, metahlurgists, electrical and water supply engineers gas makers, agents, metahlurgists, electrical and hardware of all kinds, etc., and to adept agreements with A. J. Moore-Bennett. The signatories (with one deferred share each) are: S. Denison, Hunsl.t Foundry, Leeds, engineer; A. J. Moore-Bennett, St., consulting engineer. Privatempany. The first directors (to number not less than two or more than 12) are A. J. Moore-Bennett, J. Downs (Rose, Downs & Thompson, Ltd.), Hammersmith Iron Works, Hammersmith, W. No qualification necessary. Remuneration (except managing director) as fixed by the company, Registered office: 9 & 10, Paneras Lane, E.C., and W. W. Holme Electric Co., Ltd. (140,393).—This company was

the company. Registered office: 9 & 10, Pancras Lane, E.C.

Holme Electric Co., Ltd. (140,393).—This company was registered on May 19th, with a capital of (1.000 in [A] shares, to carry on at Holme and elsewhere in the West Riding of Yorkshire the business of an electric light company in all its branches. No share shall be allotted or transferred to a person who is not either (1) a ratepayer of the Urban District of Holme, or (2) a resident within the said district, or (3) an owner of property within such district. The subscribers (with one share each) are C. Tinker, Lane Head, Holme, near Holmfirth, manufacturer; H. Howard, Lane Head, Holme, near Holmfirth, tarmer; A. Howard, Lane Head, Holme, near Holmfirth, tarmer; A. Howard, Lane Head, Holme, near Holmfirth, warper; Hubert Haddield, Lane Head, Holme, near Holmfirth, warper; Hubert Haddield, Lane Head, Holme, near Holmfirth, farmer. Minimum cash subscription, £800. The first directers are: C. Tinker, H. Howard, C. Beardsell, Harry Hatfield, and R. Calvert, Registered office: Council Offices, Holme, near Huddersfield.

Halliwell and Co., Ltd. (140, 421)—This company was

Halliwell and Co., Ltd. (140,421).—This company was registered on May 21st, with a capital of £2,000 in £1 shares, to carry on the business of electricians, mechanical engineers and manufacturers, workers of and dealers in electricity, motive power and light, etc. The subscribers (with one share each) are: H. Halliwell, Hill Crest, Singleton Road, Kersal, Machester, engineer; J. R. Halliwell, & Moss Bank Road. Crumpsall, near Manchester, electrical engineer. Private company. H. Halliwell is permanent governing director. Qualification. £100. Registered office: 43, Thomas Street, Manchester.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Foster and Pullen, Ltd.—First mortgage debenture, dated May 8th, 1915, to secure £500, charged on company's undertaking and property, present and future, including uncalled capital, registered. Holder: G. Grange, 12, Guy's Cliffe, Underchiffe Lane, Bradford. A memorandum of satisfaction in full on May 4th, 1915, of first mortgage debenture dated May 4th, 1910, securing £500, has also been notified.

Coast Development Corporation, Ltd.—Second mortgage, dated May 3rd. 1915, to secure £3,000, charged on the electric lighting station, Walton-on-the-Naze, and goodwill of business carried on there. Holders: Sir Thomas S. Cave, K.C.B., Kilworth, Woking, and others.

Wycombe Borough Electric Light and Power Co., Ltd. (53,133).—Capital, £50,000 in £5 shares Return dated March 24th, 1918. 8,000 shares taken up; £40,000 paid. Mortgages and charges, £40,000.

Brilliant Sign Co. (1907), Ltd.—Charge on certain book debts due from debtors in Belgium, dated May 6th, 1915, to secure £1,000. Holders: Capital & Counties Bank, Ltd., 39, Threadneedle Street, E.C.

Universal Cheap Cables, Ltd.—Mortgage, dated May 10th, 1915, to secure £50, charged on certain freehold land at Norman's Bay, Sussex. Holder: O. N. Lake, 219, Tufnell Park Road, N.

British Battery Co., Ltd. (137,905).—Debenture, dated May 17th, 1915, to secure £700, charged on the company's undertaking and property, present and future. Holders: A. H. Rose and T. A. Rose, 39, Beach Street, Barbican, E.C.

## CITY NOTES.

## Callender's Cable and Construction Co., Ltd.

Callender's Cable and Construction Co., Ltd.

Mr. T. O. Callender (managing director) presided at the annual meeting, held on May 20th, at Hamilton House. He first apologised for the absence of Sir Fortescue Flannery (Chairman) through illness. The capital expenditure was £14,624, against £16,119 last year. It had not been necessary to spend so much as in 1913, but still they had to make some fairly considerable extensions at the factory. On the other hand, they had slightly raised the depreciation, which now stood at £9,967, as against £8,900 in the previous year. Cable drums, contract plant, etc., stood at £40,443. They had found it necessary to modify in some respects the arrangement of their accounts, owing to the large amount of contract plant which they had to purchase in connection with the important telephone contract which they secured from the Government. Last year the item stood at £21,097. Goodwill and patents were nil, as the item had been entirely written off. The stocks of raw material were £44,811, or £22,000 down as compared with the previous year. They had been able to dispose in the ordinary course of their business of some of the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had, although they would gladly, if possible, have in the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks they had the stocks t in the ordinary course of their business of some of the etocks they had, although they would gladly, if possible, have increased certain of the items which, owing to the war, they could not get, and this during the early part of the present year caused them some inconvenience. It was common knowledge that owing to transport and other difficulties and the requirements of the Government metals, and especially copper, had been exceedingly difficult to obtain, and practically all of the reduction in the stock of raw materials was due to the inability to get the materials as promptly as they wished. That position was now improved, although railway and sea transport was still being carried on with the greatest possible difficulty. On the other hand, manufactured stock had considerably increased, and now stood at £101,145, against £68,307 in the previous year, or an increase of £32,000. That was due, again, considerably to the difficulty of transport, for it happened that at the moment the balance was struck they #88,307 in the previous year, or an increase of £32,000. That was due, again, considerably to the difficulty of transport, for it happened that at the moment the balance was struck they had a lot of stuff awaiting shipment, and the increase had long since been fully disposed of. If they put the two items or raw materials and manufactured goods together, which was a fair way of looking at it, the total was £145,956, against £135,834 in the previous year, or a difference of only £10,000. The expenditure on contracts in course of execution, etc., was £72,325, as against £137,146 last year, but this was no more than they expected, for at the end of last year, when their books closed, no new contracts were being placed, and they were simply working out the large contracts they had then in hand. So far as contract business was concerned, it was quite evident that owing to the war and the restrictions imposed on municipalities by the Treasury that there could not be the same amount of contract business for electric mains in 1915 or in the latter part of 1914 as there was in previous years. Therefore, the reduction in their contracts, although they were sorry to see it, was no more than they could have expected, and was, indeed, much less than might have been anticipated. Their debtors were £265,572, as against £219,000, an increase of £45,000. That probably might fairly be set against the decrease in the contract work, because the amount of business they did in 1914 compared most favourably with that of the previous year, both in volume and profit, in spite of the war. In fact the profit figures were conclusive evidence that they must have done a much larger business than in the past, which really was the case. Their retention money. that they must have done a much larger business than in the past, which really was the case. Their retention money, which was always a large item in the balance sheet, was £105,940, against £80,190, but as nearly the whole of the increase was owing by the Government they need have no mis-

givings. During the latter part of the year, when they had the greatest possible anxieties as to the way their business might be carried on, they found a surprising amount of assistance from the municipalities and Government in the prompt way in which accounts were settled. In August they were in great anxiety as to what the outcome of the situation would be, but they had surmounted these difficulties, and, like other people in the country, had come wonderfully well out of it. It was only right, however, that he should testify to the loyal assistance they had had from customers on their books, many of whom had been their friends and had stood by them ever since the company started in business. On the other side of the balance sheet, many of the figures were practically identical with those of last year. Bills payable, however, were £96,360, against £150,405; but on the other hand their creditors were £214.694, against £166,519. Taking the two figures together, they were much the same as in 1913. Turning to the profit and loss account, they had to deal with the handsome sum of £162,254, which, considering the state of affairs, was a very reasonable profit for the company to have made. It compared with £159,234, or an increase of £3,020. The Chairman went on to explain that the item was arrived at in rather a different way to that of previous years, and the sum shown as profit would have been a good deal more had they followed the usual custom. The £162,254 was profit after certain commission had been deducted for 1914, which was not the case in 1913. The item of £867 for allowances to staff on active service by no means represented what would be their contribution in the current year, and they still had men leaving the company's service to join the Forces. None of them would, however, grudge for one moment such contribu leaving the company's service to join the Forces. None of them would, however, grudge for one moment such contributions. No fewer than 300 of the staff and of the permanent them would, however, grudge for one moment such contributions. No fewer than 300 of the staff and of the permanent men had joined the Colours, and, in addition, a large number of men who were in the company's service at the outbreak of war, but who were not in permanent service, had also joined. In all, between 600 and 700 men who were with Callender's on August 4th had gone. That drain had, of course, beserious and caused them inconvenience, but they could hardly object to it under the circumstances. They had always considered it their duty to employ as many Naval Reserve men as possible, and they required handy and reliable men who knew what discipline was; and, of course, when war broke out they melted away like snow. Repairs and maintenance of plant and buildings amounted to £14,204. A considerable part of that upkeep was really in the way of depreciation, because when any of their plant became old-fashioned they simply dealt with it straight away. The net profit was £93,602, as against £91,861. They saw no reason for altering their policy of carrying forward substantial sums, especially in these times of serious trouble. The result had only been arrived at after a good deal of trouble and worry. At first none of them knew where they would be, and they had to grope along for some months, and they were only now getting their business into proper order. The amount of business generally in the company decreased in 1915, but not to the extent that they might reasonably have expected. The large telephone contract on which they had been engaged had been their business into proper order. The amount of business generally in the company decreased in 1915, but not to the extent that they might reasonably have expected. The large telephone contract on which they had been engaged had been suspended, but they hoped on the conclusion of war it would be renewed with much new work in addition. The re-arrangements necessary owing to the war had been done with all possible expedition, but it was not easy to take a factory designed for economically manufacturing cables and turning it into use for something else. They had a large engineering business in addition, and they had been able to take work offered to them by the Army and Navy, and especially by the Navy, with whom they had always been in close touch. They had done considerable work for the Admiralty, and it was a great satisfaction for them to know that in several of the serious operations which had taken place their work had been reported on, and they had every reason to be satisfied with the outcome of it. The Chairman proceeded to speak in eulogistic terms of the work of the British Navy, and remarked that the work they were now carrying out necessarily could not be so profitable as that which they dealt with in the ordinary course of business. Still, they would look after the interests of the shareholders to every extent which was proper and right, and he hoped they would not be unduly depressed when they came before them with the current year's accounts.

Mr. J. Varley seconded the motion, and the report was year's accounts.

Mr. J. Varley seconded the motion, and the report was

adopted without discussion.

On the motion of Mr. J. Stewarr Bain a hearty vote of thanks was passed to the board and staff.

## Mexico Tramways and Electric Companies.

CIRCULARS have been issued to the bondholders and share-holders of the Mexico Tramways Co., the Mexican Light and Power Co., Ltd., the Mexican Electric Light Co., Ltd., and the Pachuca Light and Power Co. by the directors explaining the position of affairs. As printed in the Financier, the circulars state that since the date of the issue of the last annual state of the companies the financial and political annual reports of the companies the financial and political conditions in Mexico have grown steadily worse. At the present time the affairs of the country are in a state of chaos, and practically all business is at a standstill. The directors and practically all business is at a standstill. The directors and officials have given the most anxious thought to the situation and used every possible endeavour to protect the shareholders' interests. As the affairs have reached a climax and the control of the tramways has been taken out of their

hands, they desire to lay the position fully before them. The existing situation does not arise from a financial weakness on the part of any of the companies. They have all had a prosperous existence from their inception, and, but for the political interference, there is no reason to believe that they would not still be earning not only the interest on their bonds, but satisfactory dividends for the shareholders. The credit of Mexico has steadily fallen. Power has been held now by one faction, now by another, and each new authority has issued large amounts of paper money, with the result that the value of the currency has depreciated, so that at the present time the rate of exchange is not more than 5d. to the peso, instead of 25d., the normal rate. As millions of paper pesos are already in circulation—and the amount slikely to increase rapidly—a still further drop in exchange may be expected. The Tramways Co., however, was obliged to accept this paper currency for fares, with the result that hands, they desire to lay the position fully before them. The may be expected. The Tramways Co., however, was obliged to accept this paper currency for fares, with the result that a large proportion of the gross receipts was useless for buying exchange on London and Toronto for the purpose of paying coupons or purchasing materials for maintenance and current operation. It is now practically impossible to communicate (except with great delay) with the officials of the company in Mexico, but the latest information received states that when Carranza's representative was recently driven from the City of Mexico by Zapata he took with him the "controllers" off the cars, thereby rendering them unfit for service. As a result, all traffic has ceased. The board have made numerous protests to the authorities in Mexico, and have repeatedly filed protests against the actions of the Mexican leaders through the representatives of the British Government in Mexico, the Department of the Secretary of State in Washington, and the Foreign Office in London. The authorities have not up to the present taken over the control of the Washington, and the Foreign Office in London. The authorities have not up to the present taken over the control of the businesses of the Mexican Light and Power Co., Ltd., the Mexican Electric Light Co., Ltd., or the Pachuca Light and Power Co., and the physical condition of the properties of these companies has been very little injured. It has been necessary, however, to grant a large increase in wages, with a consequent decrease in net revenue, and as the income of the businesses is largely received in paper, there is practically no available surplus after providing for the maintenance which is absolutely necessary to keep the businesses in operation. The board at the present time are conferring with the trustees for the bondholders as to what further steps, if any, should be taken to protect the bondholders' interests. The board feel, however, that the future of the enterprises must necessarily depend upon the development of the political conditions in Mexico and the future attitude of the United States Government towards that country. States Government towards that country.

## Kalgoorlie Electric Power & Lighting Corporation, Ltd.

MR. E. Pope, presiding at the annual meeting, held on Tuesday, said that the general business of the company had been maintained throughout the year, and the result was well up to the average of previous years. There was some alteration in the items of the balance sheet—the reserve established for depreciation and renewals having been written off. This fund had been used chiefly for purchasing new up-to-date plant to take the place of the original plant. The old plant had been, and was being, maintained in efficient running order, and formed a valuable stand-by plant; but owing to the progress in engineering practice it was somewhat out of date and could not be operated at a cost low enough to yield a satisfactory profit on the price at which they now had to sell current. It had, therefore, depreciated in value, and it had become advisable to write off the fund for depreciation and renewals, the cost of the plant. Out of the profit for the year £7,000 had been set aside for the redemption of debentures. As some holders might have been compelled to realise, and possibly, owing to the war, there might not have been much market, they decided to protect the holders as far as possible by buying for the company if debentures were offered. With part of the money reserved for the redemption of debentures they had subscribed for £5,000 of the war loan. There would be some increase of their operating costs during the current year, but they had reason to think that in the final result they would nearly, if not quite, maintain their average moderate profit. So far as the year had gone, they had done MR. E. POPE, presiding at the annual meeting, held on Tuesbe some increase of their operating costs during the current year, but they had reason to think that in the final result they would nearly, if not quite, maintain their average moderate profit. So far as the year had gone, they had done a little better than in the corresponding period of last year. Some of their contracts had been recently renewed, and the aggregate of current sold showed but little variation. As they knew, a great deal of the engineering capacity of the country was engaged on Government work, and whilst the war lasted they might at any time, if they had a breakdown, find it impossible to get a supply of new plant, or even of material. Fortunately, they had a fairly large stock of spare parts and supplies. Still, any breakdown, even on a moderate scale, might necessitate running their stand-by plant for a considerable time, and this would seriously reduce their profit. This was a risk they could not altogether avoid. They could congratulate themselves that the scene of their operations was outside the area of actual conflict, and that their loss was not likely to be great. At their last meeting they discussed the project of conserving all cash possible for the purpose of paying off the existing debentures, and that for this purpose they should pay the preference shareholders their full dividend in second debenture bonds, bearing 6 per cent, interest. They had come to the conclusion that it was better

to go on as they were for the present. They were of opinion that the debentures would be handled and dealt with fairly equitably and to the satisfaction of the holders when the time came. No debenture holder need fear for either his interest or his capital. The Kalgoorlie goldfield, upon the life of which they depended, would be operated at a profit long after the last of their existing debentures were paid off. In conclusion, the Chairman expressed the satisfaction of the board at the services of Mr. Crocker, their general manager, and the staff he controlled; of Mr. Batley, who represented Messrs. J. G. White & Co., their consulting engineers; and of the secretary, Mr. H. J. Dixon.

Mr. G. C. Howard seconded the motion, and the report was adopted.

Companies Struck Off the Register.—The following companies have been struck off the Register and are accordingly

Alkaline Accumulators (Paul Gouin).
Auglo-Brazilian Power and Shipping Corporation.
Beam Co. (British Electrical and Mechanical Co.).
Blast-Furnace Power Syndicate.
Coal Substitute.
Coanty Electric Traction Co.
Electric Batteries and Carbons.
Leeds Electric Co.
Scheenfel Universal Oil Filter Co.
Southwold Electricity Works.
Witney Electric Supply Co.

Cuban Telephone Co.—The gross income from rentals and miscellaneous sources aggregated over \$1,200,000 during 1914, and after deducting all costs of operation, taxes and general expenses, and providing ample depreciation reserves, the net balance of operating income amounted to over \$559,000. The company paid during the year two quarterly dividends on preferred stock, totalling \$60,000, and one quarterly dividend on common stock, amounting to \$62,500. Nearly \$700,000 of the accumulated net cash surplus has been used for the purpose of carrying on construction work. The general financial stringency has made impracticable the further placing of securities, hence the action of the directors in not declaring the dividends which have been earned.—
Financial Times. Cuban Telephone Co.—The gross income from rentals Financial Times.

Anderston Foundry Co., Ltd.—The accounts for the year to March 31st show that £5,321 was brought in, and the profit, after providing for depreciation and income-tax, was £30,707 (against £40,984). It is now recommended that there should be paid a final dividend of 15s. 6d. per share (making 20s. per share for the year), less tax, the same as for the previous year. £2,500 is placed to reserve.—Times.

Stratford-on-Avon Electricity Co., Ltd.—Mr. G. M. Bird presided at the annual meeting held on the 14th inst. He regretted that it had been necessary to pass the dividend on this occasion. They had hoped to steadily progress until 5 or 6 per cent. was paid, but the year had brought a set-back. There were advances in fuel and wages, and several breakdowns on the mains which occasioned considerable expenditure for repairs though which occasioned considerable expenditure for repairs, though other repairs and maintenance charges were reduced. He did not think there would be a big advance in anthracite coal. Unfortunately they could not increase the price of electricity, as their agreenately they could not increase the price of electricity, as their agreement with the Corporation bound them not to exceed 5d. per unit for lighting. The Corporation had increased the price of gas by 4d per 1,000, and they might be disposed to allow the company to advance their rate per unit, and if it was found that the present price could not be made to pay they might approach the Corporation. Mr. Priest seconded the adoption of the report.

Doulton & Co., Ltd. -A financial daily states that after paying 5 per cent, on the preference shares for the year ended Docember, 1912, £31,626 is to be carried forward.

Veritys, Ltd.—The directors, according to the Financial Times, recommend a dividend at the rate of 6 per cent. per across on the ordinary shares for the half-year, making 6 per cent. for the year, carrying £1.001 forward.

Havana Electric Railway, Light and Power Co.—
The accounts show the business for 1914 in comparison with 1913
was as follows:—Gross earnings, \$5,396,713, against \$5,417 054;
operating expenses and taxes. \$2,595,321, against \$2,612 952; nst
income, \$2,801,392, against \$2,804,101. Dividends paid during the
year, 6 per cent. on preferred and 5 per cent. on common stock.

Lima Light, Power and Tramways Co.states that the net profit for 1914 was \$p120,259. There is to be put to reserve and redemption fund, \$p28,867; to reserve for ball and doubtful date \$2.10,000. and doubtful debte, £p10,000; to extraordinary repairs, £p16 81; to provision for losses in exchange, £p7,000; and the dividend 1 per cent. (in respect of the first quarter of 1914, since when no dividend has been paid), £p13,498; leaving £p50,077 to carry

United River Plate Telephone Co., Ltd.—The gross earnings for 1914 were £630 652, less maintenance and other charges in Argentina and Lindon, £468,846. After paying the preference dividend and the interim dividend on the ordinary shares, preference dividend and the interim dividend on the ordinary shares, there remains £103,206, plus £6 357 brought forward; £2,000 is to be put to staff provident fund, £20,000 to reserve, and a final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year, is recommended, leaving £6,563 to be carried forward. The directors refer with regret to the death of Mr. D. Smith, for many years secretary and latterly managing director. Annual meeting held westerday. held yesterday.

## Anglo-Argentine Tramways Co., Ltd.

For the year 1914 the gross receipts were £2,850,995, less working expenses £1,880,996, leaving £969,999. After adding interest on investments at £13,421 brought forward, and deducting debenture, loan, and preference interest and charges, £917,388, there remains £96,409, which is to be carried forward as, having regard to the decrease in the traffic receipts for the correct year as compared with those of 1914, and the unas, having regard to the decrease in the traffic receipts for the current year as compared with those of 1914, and the uncertainty of the outlook for the remainder of 1915, the directors have decided not to recommend any dividend on the ordinary shares. The average number of miles of surface line open for traffic working throughout the year has been 361, against 348 in 1913. The extension to Caballito of the first subway line from Plaza Mayo to Plaza Once was opened in April as far as Rio de Janeiro Station, and the entire line on July 1st, the whole length of the subway open, with extensions, being 41 miles. The construction of the second subway line between Retiro and Plaza Constitución, which under the company's municipal concession was to be completed by December 31st, 1914, has been postponed under the authorisation of the Municipality.

December 31st, 1914, has been postponed under the authorisation of the Municipality.

Mr. G. Pedrial, the general manager, as usual makes a detailed report on the posttion of affairs. Business was bad from the commencement of the year 1914. The local crisis of the previous year continued, failures being frequent, and many large and important firms involved. Land speculation and the restriction of credit by the banks were the causes. The war came as the last straw, and absolutely paralysed everything for the rest of the year. The effects are still felt, in spite of the excellent harvest prospects. Excess of emigration over immigration amounted to 61,103 for 1914. The tramways were, of course, affected, as the following returns show, and the traffic receipts were diminished, notwithstanding the additional facilities offered by the subway:

Surface. Subway. Total.

Surface. Subway.

Surface. Subway.

340.014.573 2.125.849

3030.500.792 28.514.462

10.7

81.740.329 165.104

78.072.894 3.556.177

4.5 Passengers carried 1913 1914 Decrease per cent., 1913 Car kilometres run 1913 1914 342,140,422 332,015,254 2.9 81,905,426 81,629,071 0.3 Decrease per cent., 1914

The total rolling stock increased from 2,603 to 2,676. rolling stock was maintained at a considerably reduced cost, but 1914 was not a year for records, as heavy and continuous rains caused floods, with consequent detrimental effects upon the car equipments. Approximately, 21 km. of new track were brought into service, and reconstruction of permanent-way track has been completed or taken in hand in several directions. track has been completed or taken in hand in several directions. The severe drop in receipts on all lines renders comparisons of value impossible, otherwise it would have been interesting to draw conclusions in regard to the effect of the opening of the subway. Many lines have already been favourably affected, and have become valuable feeders to the subway. Energy consumption per car km. has been further decreased, the average decrease being 17 watt-hours per car km. run. This is a result of the improved condition of the rolling stock and of the careful attention given to the manner of driving. The gross receipts were £2,847,471, a decrease of £115,673, but they were still in excess of the 1912 figures by £94,399. The report gives figures showing the continuous fall that took place in receipts for the subway during each of the months from July to December, and on the surface lines during the whole year. Import and export trade was seriously affected by the war; freights on coal had oscillated from 11s. to 25s. per ton to Buenos Aires; and Cardiff coal of best quality was extremely difficult to purchase.

The average consumption of current per car KM, on the surface lines was 613 watt-hours in comparison with 630 watt-hours in 1913.

On the subway in 1914 the average consumption was 1,810 watt-hours per

Car KM.

The 12 per cent, additional municipal tax for 1914 amounts to \$82.131.

Passengers per car KM. (surface lines have decreased from 4.16 in 1913 to 3.89 in 1914.

to 3.89 in 1914. Expenditure per car KM. (surface lines) have been reduced from 24.87 cents to 23.06 cents. This is due partly to the reduced 12 per cent. tax for 1914, working out at over half a cent less per car KM., and partly due to economy in maintenance of cars, track, overhead line and buildings, equal .87 cents.

working out at over half a cent less per car km., and partly due to economy in maintenance of cars, track, overhead line and buildings, equal 37 cents.

Expenditure for the surface lines was £1.572,079, a decrease of £202,867; and for the subway £129,887, an increase of £121,849. The net receipts decreased by £148,901 for the surface lines and increased by £114,246 for the subway. The gross receipts, therefore, show a decrease of £115,673, or 3.90 per cent. The expenditure decreased by £81,018, or 4.54 per cent., and the net receipts by £34,655, or 2.94 per cent. The percentage of expenditure on receipts has been 59.77 per cent. compared with 60.17 per cent. in 1913. Expenditure has been kept at a minimum, and important economies have been effected in all sections. From the labour point of view, the year in Buenos Aires has been the quietest ever experienced, owing to the subject of prospects, says:—

The forecast contained in my report for 1913 was, of course, completely upset;

The forecast contained in my report for 1913 was, of course, completely upset; in the first place owing to the fact that the local crisis, which had been threatening for a whole year, became suddenly worse about the month of April, 1914, and then matters were thrown all out of gear by the outbreak of the European war. The past year has been a great lesson to everybody in this city. Whereas formerly money was plentiful and the tendency was to spend generously, now everybody is economising, and even though business may have slightly improved since the new year, there is no doubt that the spirit of economy is still in the ascendency, so that our receipts are, if not still dropping, at any rate at a complete standstill. Under these circumstances, it is extremely difficult to even make a guess at what our receipts should be furing 1915. Unfortunately, however, there is no doubt that we cannot expect any increase whatever on the year 1914, and in all probability there will be some decrease.

The annual meeting was held made and the course of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the surface of the

The annual meeting was held yesterday.

## West London and Provincial Electric Supply Co.. Ltd.

MR. HARRY KAHN presided over the annual meeting, at 14, Ironmonger Lane, E.C., on May 19th. He said that the success of the Chiswick Electricity Supply Corporation spelt the prosperity of the company. Out of the available balance, £3,337, they were paying 6 per cent. on the preference shares, carrying forward £393, as compared with £26 brought in. The balance sheet was now a perfectly clean one, the item preliminary expenses £483, having been written off in the previous year. In regard to the Chiswick Electricity Supply Corporation, which supplied Chiswick and Aberystwyth, in view of war conditions there was every reason to be satisfied with the results submitted. During the year the number of consumers had increased by 111 to 2,717, but owing to the lighting restrictions the increase in consumers had only partly made up for the reduced consumption for shop-front and consumers had increased by 111 to 2,717, but owing to the lighting restrictions the increase in consumers had only partly made up for the reduced consumption for shop-front and similar lighting, the total revenue being down from £19,440 to £19,369. Nevertheless, owing to the saving in the cost of fuel resulting from the Diesel engine installed in 1913 ccming into full use during the year, and in spite of the increased cost of coal and the increase in local rates, the balance carried to net revenue account was £249 higher than for 1913, namely, £8.813. The net revenue account, after payment of debenture interest, trustees fees, and premium on sinking fund policy, showed a balance of £4,787, which represented the net profit, as against £4,643 for 1913. This amount the corporation had utilised by paying a dividend of 6 per cent. on its ordinary shares, and by transferring the balance of £1,019 to depreciation reserve fund account. It was difficult to give any accurate forecast for 1915. Up to the present the revenue from the Chiswick undertaking continued to show a considerable falling off, owing to the lighting restrictions now in force. This falling off, however, would naturally be proportionately less during the summer months. To make up to a certain extent for the loss of revenue, the advance in the price of coal and other increases in the cost of production, the directors of the corporation, in common with other Metropolitan supply companies, were reluctantly compelled to increase the charge for current by 10 per cent. from April 1st. As regarded Aberystwyth, conditions were looking better, as the revenue had increased owing to the town being full of soldiers who were billeted at the various boarding-houses, etc., which had consequently used more current than usual at the non-season period. The corporation were installing a second soldiers who were billeted at the various boarding-houses, etc., which had consequently used more current than usual at the non-season period. The corporation were installing a second Diesel engine at Aberystwyth in place of the old steam set, and estimated that a considerable saving in the cost of production would be effected by this expenditure.

Mr. W. B. Esson seconded the motion.

In reply to Mr. Charrington, Mr. Esson said the extra Diesel engine to be installed at Aberystwyth would bring the capacity up to 350 kw. They were replacing a steam set, and it did not increase the capacity, but the economy.

## Delhi Electric Tramways and Lighting Co., Ltd.

Mr. A. W. Tait presided at the annual meeting, held on May 19th, at Basildon House, E.C. He said that the combined undertakings showed a net revenue of £8,163, as compared with £6,252 in 1913, and £2,990 in 1912. The progress was satisfactory. The increase in the gross revenue had been 10 per cent. for the trainways and 19 per cent. for the electricity supply. The trainway traffic receipts had been adversely affected by the monetary conditions created by the war, and, in addition to the usual accident claims, they had to meet a judgment for a somewhat costly accident claim. But for these incidents, the trainway undertaking would probably have paid its way during the year, and this after charging current from the supply undertaking at the rate of 14d. per unit. The unsuitable type of car was responsible for heavy annual maintenance charges and abnormal current consumption, but they were unable to deal with that matter until capital could be provided to install new cars with double motor equipment. Permanent-way maintenance was still heavy, but contract arrangements made during the year had resulted in a small saving. The passengers carried numbered 5,465,450, an increase of 13½ per cent. Over 57 per cent. of the passengers only travelled half-a-mile or under, and the first-class traffic still remained very small, being under 6 per cent. of the total. The total number of car miles run was 434,094, an increase of 9 per cent., while the receipts per car mile were 5.4d., as against 5.2d. in the previous year, and they carried the total available population 23½ times during the year, as against 20¼ times in 1913. During the year they had some difficulty with the staff, and in May they had a serious strike, in which they lost nearly half of the drivers. With a view to ercouraging a better class of employé, they had had under consideration provident and bonus schemes. A bonus scheme had been put into operation, the effect of which would be closely watched, and if the results instified it, a provident scheme might also MR. A. W. Tair presided at the annual meeting, held on May

be linked up with the Government station, which would enable them when desired to draw alternating current from them, and, should it be necessary, to give them a supply when the same might be available. The units generated showed an increase of 26 per cent., and the average cost was .92d., as compared with 1.08d. The units sold for lighting and power were 931,219, an increase of 26 per cent., and the units used by the tramway system were 572,393, an increase of 16 per cent. The units sold for lighting and power in 1909 were 188,072, as against the 931,219 last year—an increase of 395 per cent. in the five years; while the traction units during the same period showed an increase of 55 per cent. During the first six months of last year they connected 193 new consumers, which was the highest rate the company had reached, the first six months of last year they connected 193 new consumers, which was the highest rate the company had reached, but during the second six months they only connected 138 new consumers. The growth of the power supply had been quite satisfactory, but they could not expect any great developments in this connection, as Delhi was not a large industrial centre. There might be some falling off in the rate of progress during the present year owing to the causes he had referred to, and to a certain amount of competition which had surring up. With regard to the current year he could only sprung up. With regard to the current year, he could only say that, provided they had no breakdowns in the power station, or serious diminution in revenue due to the conditions created by the war, it was reasonable to suppose that the results would show some improvement over those for the results would show some improvement over those for 1914. With regard to the new city of Delhi and the concession for electric lighting and tramways, nothing would be done in regard to this until the shareholders had had an opportunity of expressing their opinion on the whole matter. The directors would shortly have an opportunity of discussing the situation with the general manager, who proposed to come to London. His (the Chairman's) impression was that the Government would not take any definite steps towards asking for tenders for some little time. There was, however, considerable field for expansion of the company's existing system of supply, and during the next twelve months they would have to incur capital expenditure to approximately £25,000 in order to cope with the demand. Before the war the directors had under consideration an issue of second debentures, to which the consent of the Indian Government had been obtained. If conditions improved, he hoped before very long they might be able to do something in the way of had been obtained. If conditions improved, he hoped before very long they might be able to do something in the way of raising the necessary capital, but that, of course, was dependent upon the sanction of the Treasury during the period of the war, and application was being made to ascertain whether permission would be granted. Although it was unfortunate that the surplus profits must be applied in the manner he had indicated, there was at least some satisfaction to the shareholders in knowing that steady progress was being made, and that the balance of profits which would otherwise be available for dividend on the preference shares continued to grow, and he hoped that at some time in the not very distant future they might be able to declare a preference dividend.

Mr. T. W. STRATFORD-Andrews seconded the motion, which was adopted.

was adopted.

## River Plate Electricity Co., Ltd.

THE annual general meeting was held on Friday last, at Capel House, New Broad Street, E.C. Mr. M. W. Mattinson, K.C., who presided, said that the accounts showed a substantial reduction in the available profits compared with 1913. House, New Broad Street, E.C. Mr. M. W. MATTINSON, K.C., who presided, said that the accounts showed a substantial reduction in the available profits compared with 1913. The company had been in existence 12 years, and at the end of every year up to the present he had been able to report an improvement in its position. On this occasion they had to submit to some set-back in their progress, but when all the circumstances of the times were taken into account the result was only what they might reasonably have expected. The net profits were about £10,400 less, and half of that deficiency was solely and directly attributable to the war, as during the past year the company had only received three months' instead of a full twelve months' interest upon its investment in the German Trans-Oceanic Electric Co., of Berlin. The acquisition of that investment went back to the inception of the company, when they disposed of the old and decayed electric station at Buenos Ayres to the German company, which then, as now, was the principal electric company in that city. In return, in addition to some cash, they received £150,000 in 5 per cent. obligations of the company, which had always paid large dividends on its ordinary shares, which came behind their obligations. The annual amortisation of the obligations and the interest had been met up till last year, when the outbreak of war suspended all commercial relations between this company and Germany. They assumed that at the conclusion of hostilities the German company would resume payment of its obligations. The shortage of income last year from that default was a little over £5,000, but as they received one quarter's interest on the bonds, the shortage in the current year would be some £1,700 more. The balance of the lessened profit was due to less favourable working results in the Argentine, due largely, though not wholly, to the war. While the number of their consumers at La Plata had increased substantially, the average consumption of current had gone down. Since the war bro

and but for the care and thrift exercised by the manager (Mr. Lindop) the diminution in profits would have been much greater than it was. They were carrying out their engagements with the Government both in the letter and the spirit by putting the lines underground in most of the important thoroughfares. They had also agreed to substitute half-watt lamps for the public lighting in place of the present are lamps. The plant which had thus become obsolete had been scrapped, the loss being charged against revenue. Taking all those considerations into account, he thought it was cause for satisfaction that the profits were as large as they were. The sale of the company's Tucuman station was completed last June, and the board were satisfied that they had acted wisely in disposing of it upon the terms which they obtained. The sale of the company's Tucuman station was completed last June, and the board were satisfied that they had acted wisely in disposing of it upon the terms which they obtained. The whole district had been in a most depressed condition throughout the year, and if they had continued to operate the station under the competitive conditions which had prevailed they must have had a large loss, which would have helped to materially reduce their profits at La Plata. After careful consideration the board had decided to recommend the payment of a dividend of 8 per cent. for the year upon the ordinary stock. That was less than they had paid during the previous four years, but it was in excess of the average dividend paid since the incorporation of the company. In determining the dividend they had to have regard to the future outlook, and he estimated that by carefully husbanding their resources they would be able to complete their programme without having to raise any fresh capital or creating any floating debt. They felt that they could easily pay the 8 per cent. ordinary dividend without unduly straining their resources, and the reason they were able to do that was because they had kept the ordinary capital down to a very low figure. They had built up the business out of the savings of former years and out of profits made in other directions, and by the issue of ordinary shares at a premium. In the first four years of their existence they paid no ordinary dividend; in the fifth year they paid 2½ per cent.; the next year 6 per cent., while during the four years preceding 1914 they paid 10 per cent. This year they had had to drop to 8 per cent., which gave an average of 6 per cent. over the whole period. He might say that although they were not putting anything this year to general reserve, they were strengthening the future position by carrying forward £20,000 instead of £13,000 as last year.

Mr. R. Miller seconded the motion, which was carried unanimously.

Mr. R. MILLER seconded the motion, which was carried unanimously.

## Willans & Robinson, Ltd.

Willans & Robinson, Ltd.

The annual meeting was held recently at the Victoria Engineering Works, Rugby. Mr. J. O. Peacher, who presided, said that the accounts showed a substantial improvement in revenue, notwithstanding the abnormal times. After paying the dividend as recommended, the reserve fund would amount to more than sufficient to cover a year's dividend on the preference shares and stock. For the first six months of the year 1914 conditions were normal, and they obtained a fair share of turbine business at prices somewhat better, owing to the excessive competition of recent years, than had previously prevailed. In consequence, the profit from this, which was the main portion of their business, had been the principal factor in the improved results shown. The Diesel engine, too, had continued to provide a satisfactory volume of trade, and the repeat orders which were being regularly placed by customers bore practical testimony to the reliability and excellence of the Willans-Diesel engine. With the outbreak of war the whole conditions of business were disturbed. From November onwards their standard lines of output had to take a second place, and the volume of production, too, was gravely affected, for the directors considered it right not only to give absolute preference to Government work, but also to encourage enlistment among the employés. Over 20 per cent. of the male employés of the company were now serving in His Majesty's Forces—that was some 50 per cent. of the male employés who were eligible. Since November the works had been largely engaged on the supply of munitions of war, and the ordinary business had suffered not only by being to a considerable extent put on one side to make way for Government work, but also by increased cost of production due to the general rises in wages and materials which had taken place and to the difficulty in temporarily replacing the men who had gone to the Front. Liberal provision was being made by the company for dependents of these men while away on a rice, and i

Mr. DAVENPORT seconded the resolution, which was carried.

## Brisbane Electric Tramways Investment Co., Ltd.

The annual meeting was held on Wednesday at Winchester House, E.C. Mr. H. R. Beeton, in proposing the adoption of the report, said that the total receipts of the tramways for the past year amounted to £348,406, as compared with £316,244 for 1913, and the expenditure, including costs in connection with the Arbitration Court award, amounted to £194,960, as against £124,308, and that, with £3,436 brought forward, gave an available balance of £156,882. This is to be dealt with as shown in our last issue. There had been an increase of £150,000 in the ordinary share capital, due to the issue of 30,000 new shares, which were all taken up by the shareholders. The capital expenditure on the tramways during the year had amounted to £103,751 for the construction of extensions, the purchase of equipment and plant, the building of new car sheds, and the acquisition of a new power house site. The site of their present power house station was held on a lease from purchase of equipment and plant, the building of new car sheds, and the acquisition of a new power house site. The site of their present power house station was held on a lease from the Queensland Railway Commissioners which expired in 1926, but which might be required by the Government before that date. They had therefore thought it prudent to avail themselves of an excellent site which was available not far from the present station, so that the alteration to the feeder system would be reduced to a minimum. £47,500 of available cash not immediately required had been invested in the purchase of £50,000 of the War Loan, a course which he felt sure the shareholders would approve. The most important event during the year had been the High Court's decision in the tramway case which, as they anticipated, annulled the decision of the Commonwealth Conciliation and Arbitration Board. A number of men had joined the Australian Expeditionary Force, and their employés were contributing to the patriotic fund at the rate of £100 per month. The company would, of course, keep open the places of the men who were serving with the Colours. The Tramway Company had already subscribed to the British war funds, and they proposed to extend their support to the Queensland war funds.

Mr. J. B. Concanon seconded the resolution.

Replying to a shareholder, the Chairman said that the power station and the road equipment were maintained in the highest state of efficiency. They were undoubtedly approaching the

station and the road equipment were maintained in the highest state of efficiency. They were undoubtedly approaching the time when they would have to face a certain limited expenditime when they would have to lace a certain infinited expenditure on the renewal of the permanent way, for which their present renewals fund was altogether adequate. The reserve fund was available for the general purposes of the company, either for the equalisation of dividends or for periodical distribution. tion by way of bonuses should the board consider it prudent.

The report was adopted.

## STOCKS AND SHARES.

TUESDAY EVENING.

ITALY'S long-delayed intervention in the war has had a cheering effect upon Stock Exchange sentiment, but, so far, has been effect upon Stock Exchange sentiment, but, so far, has been without influence on quotations. The idea is prevalent that, with the help of our latest ally, the war should be shortened by at least six months; and her entry into the theatre of hostilities—as the newspapers put it—has been hailed with satisfaction in the Stock Exchange, as elsewhere. The most dramatic event of the week just past was the denunciation of "a certain section of the English Press" which attacked Lord Kitchener on the day before the Stock Exchange separated for its Whitsun holiday, and which culminated in a vote of confidence in the War Minister, followed by the burning of the Daily Mail. Lord Kitchener replied in a cordial telegram of thanks. of thanks.

Home Railway securities remain dull, and the terrible tragedy of the troop train lies like a pall over the market. Where prices have moved at all, they have gone back a little, the Undergrounds have moved at all, they have gone back a little, the Undergrounds easing off with the rest. The succession of Lord George Hamilton to the chairmanship of the Underground Electric Railways of London, in place of Sir Edgar Speyer, Bart., P.C., caused no alteration in prices. Central Londons are still wanted, but Metropolitans and Districts have both gone back \(\frac{1}{2}\). Other stocks are dullish.

Electricity Supply issues show one alteration—a fall of \(\frac{1}{2}\) in County of London Preference being the solitary instance of a change in this market for a fortnight. It is by no means easy to pick up shares. There are buyers about for several of the best-known issues, which, however, are not offered at anything like the

pick up shares. There are buyers about for several of the best-known issues, which, however, are not offered at anything like the market prices. It might be supposed from the quietude of the market that the tone was depressed, but, in point of fact, the difficulty is to get shares, not to sell them. This, of course, is the season of the year in which the public investor as a rule declines to have anything to do with what may be called illumination issues. In these disjointed times, however, there seems to be nothing surprising in the demand for electric lighting shares, with

nothing surprising in the demand for electric lighting shares, with an accompanying absence of supply.

Most of the markets connected with Mexican securities have been further depressed, the reason being lurid illumination cast upon the affairs of that country by a circular issued to the proprietors of the Mexico Tramways Company and its three associated concerns. In this it is pointed out that affairs are in a state of chaos, and practically all business is at a standstill. Matters have reached a climax, and the control of the tramways has been taken out of the hands of the directors and officials. The rate of exchange is 5d. to the peso, instead of the normal 25d., and a

further drop may be expected. The Mexico Tramways employes asked last October for 25 per cent. increase of wages, recognition of the Union, and other conditions, to agree to which would have ruined the Company. A strike was proclaimed, and the tramways ceased running. Then the authorities took over the operation of ceased running. Then the authorities took over the operation of the lines, doubled the salaries of part of the staff, and gave a 25 per cent. rise to the rest. The tramways receipts were paid into the sompany's bankers for a short time, but later on were diverted into the Government Treasury. When Carranza's representative was driven from the City of Mexico by Zapata, he took with him the "controllers" off the cars, with the result that all traffic has

The Mexican Light and Power Company has suffered little physical damage, but although electric light is still freely used, it has not been possible to obtain payment for the company of the company has suffered little physical damage. physical damage, but although electric light is still freely used, it has not been possible to obtain payment for the same. Over two million pesos is owing for street lighting or power furnished to the Government. Repeated protests have been filed by the board through different diplomatic representatives, but apparently without any success. The board feel that the future of the enterprises must necessarily depend upon the development of the political situation in Mexico, and the future attitude of the United States Government towards that country.

Other foreign securities are none too good. Brazil Tractions have fallen a further 2 points to 52, the Bio rate of exchange being erratio and unstable. Dr. F. S. Pearson (the president of the company), who went down with the ill-fated Lusitania, has been succeeded by Mr. Alexander Mackenzie, of the Rio Tramways and San Paulo Light and Power Companies. Anglo-Argentine Trams have

oeeded by Mr. Alexander Mackenzie, of the Rio Tramways and San Paulo Light and Power Companies. Anglo-Argentine Trams have weakened on the passing of the dividend on the Ordinary shares. For the past half-decade, 1909-13, the annual dividends have been 6, 7\frac{1}{4}, 7\frac{1}{4}, 8\frac{1}{4} and 6\frac{1}{4} per cent. respectively. The net revenue fell off by only £26,000, but the interest charges were largely increased; and instead of paying a dividend on the Ordinary shares, the directors have elected to carry forward £96,400, an increase of £83,000 as compared with the previous year. In view of the very large amount of British capital invested in the Anglo-Argentine Tramways, it may be of interest to set out the principal items in the balance-sheet for the past seven years; the figures compare as follows: as follows :-

				PITRITILIE	<b>.</b>

The Bombay Electric Supply and Tramways Company has just The Bombay Electric Supply and Tramways Company has just announced a dividend on the ordinary shares at the rate of 6 per cent., which is the same as that for a year ago; a bargain was done on Tuesday at 7.16, being the first transaction recorded in the shares since the Stock Exchange re-opened, at the beginning of January. The Shanghai Electric Construction Company has announced a dividend of 6 per cent. for the year, a decrease of 1 per cent as compared with 1913; the falling-away is explained entirely by the loss of exchange on subsidiary coinage, which came to no less than £28,000, equal to 83 per cent. on the capital of the Company.

to no less than £28,000, equal to 8\(\frac{3}{4}\) per cent. on the capital of the Company.

The Telegraph market is irregular. Eastern Ordinary and Preference are both better, but Globes of each sort have given way a little. Anglo-American Preferred fell a point, and New York Telephone 4\(\frac{1}{4}\) per cent. bonds are 1\(\frac{1}{4}\) lower. The United River Plate Telephone report is a good one, showing a net profit of £161,800, allowing payment of the regular 8 per cent. for the year, free of income-tax. The report of the Cuban Telephone Company explains that the general financial stringency has made impracticable the further placing of securities; hence the action of the directors in not declaring the dividends which have been earned. For the year, the Preferred stock received six months' of the directors in not declaring the dividends which have been earned. For the year, the Preferred stock received six months' dividend, and there was one distribution for three months made on the Common. The company's 5 per cent. first mortgage bonds stand about 79, but the Preferred has not changed hands this year. In the manufacturing group, Callenders gained the fraction at 12½, though, on the other hand, Henleys eased off to 14 and India-

Rubber shares to 11, while British Insulated at 11½ are ½ down on the week. British Aluminiums have hardened, and manufacturing shares on the whole are very steady, commanding a fair amount of anteres on the whole are very steady, commanding a fair amount of attention. The rubber market keeps firm, owing to the produce holding its price of 2s. 5d. per lb.; while nearly every report which appears shows substantial reduction in working costs. The Armament issues have a slightly sagging tendency, for which absence of business is held responsible. The strong measures taken by the L.C.C. in connection with the strike of tramwaymen had no effect the production of the market but they have been discussed with conupon prices in the market, but they have been discussed with considerable satisfaction. In the Stock Exchange, at all events, there is extremely scant sympathy for the employés who chose a time like the present to disregard the counsels of their leaders and to do their best to add discomfort and loss to the community at

Swedish Electrical Exports.—The exports of electrical machinery and apparatus from Sweden during the three months ending with March last attained a value of £66,140, as compared with only £55,402 in the corresponding quarter of 1914. On the other hand, there was a marked decline in the exports of telephone material and apparatus—from £102,781 to £61,977.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and they may vary according to quantities and other circumstances.

The Chief Technical Assistants' Association.—An inaugural dinner in connection with this Association was held at Pinoli's Restaurant. Wardour Street, W., on Thursday evening, May 20th, with Mr. J. T. Baron (resident engineer of St. Pancras) in the chair, supported by Mr. T. K. Richardson (generating engineer of St. Marylebone) in the vice-chair. This Association, which was originally formed by the chief assistants of London, embodies generally the chief technical assistants of the large undertaking. As a consequence of the war, it was not thought expedient that any musical programme should be arranged, and the proceedings consequently partook largely of a speech-making character; amongst the gentlemen who spoke in support of the Association and its objects were the following:—The chairman and vice-chairman; Mr. J. B. J. Bowden (deputy engineer of Hackney); Mr. J. Leadbeater (assistant engineer at Hampstead); Mr. J. H. Parker (chief assistant engineer at Croydon); Mr. H. F. J. Thompson (chief assistant engineer at Battersea); and Mr. W. Young (resident engineer at Stepney). On the whole, a very enjoyable evening was spent, and the chief object for which the dinner was held, namely, that the more recent members might have an opportunity of making the personal acquaintance of, and becoming better known to, the older ones, was thoroughly realized.

## A MOTOR SEARCHLIGHT PLANT.

One of the features of the great war that will stand out prominently when its full history comes to be written will be the many new uses it has found for the motor vehicle. Among these, from an electrical point of view, are the motor

SEARCHLIGHT MOUNTED ON SPECIAL TROLLEY.

X-ray machines for use in conjunction with the medical service, automobile wireless telegraph stations, and travelling searchlight plants. Shortly after the outbreak of hostilities, we published some particulars and illustrations of the motor searchlight plants which had been constructed by Messrs. De Dion, Bouton & Co. for the French

De Dion, Bouton & Co. for the French War Office, and we are now able to do the same as regards a motor searchlight plant which has recently been completed by the Austin Motor Co., Ltd., of North-

field, Birmingham.

The motor lorry, on which the searchlight outfit is carried, consists of a standard Austin 2-3-ton chassis, the bodywork having been specially designed and constructed for the purpose for which the vehicle is being used. The electricity-generating plant, which has also been designed and manufactured by the Austin Co., is located in the forward part of the body, behind the driver's seat, and is entirely distinct from the engine employed to propel the vehicle; it comprises an Austin 12-H.P. 2-cylinder petrol engine provided with a specially-designed cooling system and exhaust-silencing chamber. The engine is coupled direct to a dynamo having an output of 120 amperes at 80 volts, and at a speed of 1,000 R.P.M.; the generator is connected up to a drum carrying a long length of cable, the contact being so arranged as to avoid the possibility of a fault developing from it whilst the drum is in motion.

In order to allow the searchlight to be used some distance away from its current-generating plant, the projector, as

will be seen, is carried on its own special trolley, which runs

on four pneumatic-tired wheels.

In order to provide a safeguard against the danger when on inclines of the trolley over-running the men, the rear wheels are provided with brakes operated by a hand lever at the back of the trolley chassis. The projector itself was constructed by Messrs. Crompton & Co., Ltd., of Chelms-

ford, and is mounted on a swivelling base, and also swings in horizontal trunnions. It will also be noted that a seat which revolves with the projector is provided for the operator.

Both the horizontal and vertical movements are controlled by means of worm gearing; the latter can be thrown out of gear, enabling the light to be quickly swung into the desired position, and the beam adjusted with the necessary precision. Although the projector illustrated is only of 24 in diameter, the plant is adequate to furnish the current for a 30-in one, but by the use of the smaller diameter a highly efficient result is assured.

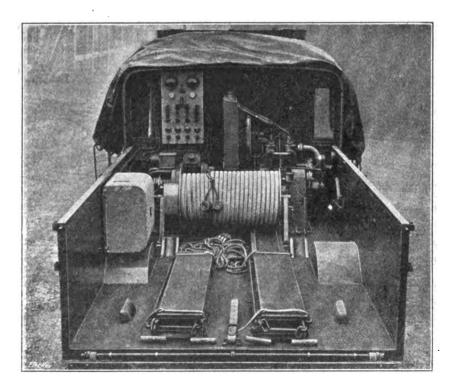

The searchlight trolley, which is unloaded from, and re-loaded on to, the motor lorry by means of ramps and tackle, has been specially constructed to enable it to be used over rough ground—possibly for long distances—independently of the motor-lorry, in the event of capture, damage to, or destruction of that unit.

The electricity generating plant, when not required to run the searchlight, can be used to furnish current for the temporary lighting of officers' quarters, field hospitals, or any other purpose for which a good light is desirable, a switchboard being included in the equipment.

## SINGLE AND MULTIPLE GROUND - WIRE ANTENNÆ

THE capital cost and various working risks associated with the use of ordinary aerials offer sufficient incentive to investigate thoroughly the possibilities of low horizontal aerials. If found reasonably effective, the latter should be useful in many

commercial stations, and offer obvious advantages for special temporary Press installations and for military purposes, where easy erection and inconspicuousness are important considerations. For some time there has been no doubt that bare wires laid along dry soil are capable of

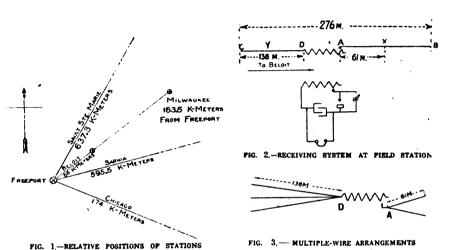

SEARCHLIGHT GENERATOR, CABLE DRUM, &c., ON MOTOR LORRY.

receiving radio-signals more or less effectively, but only recently have the results of important American experiments been published, showing that such a conductor remains effective even on damp ground, and can easily be modified to secure efficiency of reception commensurable with that of an elevated aerial over commercial distances. The tests in question have been in progress at Beloit (Illinois) for

some 18 months past, and have led to certain definite conclusions, although further quantitative data are required before the design of horizontal aerials can be reduced to an

Since orientation affects considerably the working of horizontal antennæ, it is necessary to bear in mind the relative positions of the stations mentioned below; these are shown in fig. 1.* Most of the tests were carried out between Beloit and a field station at Freeport, the receiving circuit there being as shown in fig. 2, and using crystal detectors. Signals of uniform intensity were emitted from Beloit of 900-m. wave length, and of the bare No. 18 copper wire (274 m. long) at Freeport, half OD rested on the earth while AB, at first, was hung by linen thread 7 ft. above ground. As a result of preliminary tests it was found best to shorten the wire AB (towards Beloit) and lay the whole wire CX on the ground, the best lengths of wire to receive the 900-m. waves over a distance of 84 miles being c D = 188 m. and x = 61 m. During most of the tests the grass-covered thin soil, with limestone subsoil, was dry, but with the wires lying in wet grass the Beloit clock signals could still be heard, and no difference could be detected between the efficiency of the system when CD rested on wet soil in a field of stubble and when it was insulated on

stakes 1 ft. high. No appreciable improvement in tuning or loudness was secured by substituting for C D a connection to the water of a creek.

With the wire A x due north and the longer wire C D in various positions, best reception was obtained with the long wire extending directly away from Beloit. Commercially readable signals could be obtained using only & kw. input to the Beloit aerial (four 90-m. horizontal wires, two 30-m. slanting wires; horizontal section at 45 to the meridian, free end extending S.E.; logarithmic decrement 0.16 with 900-m. wave.)

By using a "fan" of three wires in parallel to the left of D (fig. 3) and of two wires to the right of A, the intensity of rignals was greatly increased, and the received intensity of Milwaukee and Chicago signals seemed to be as great as when the large elevated aerial at Beloit was used. By adding a third 61-m. wire (to form a 3-wire fan) at A, still better results were obtained, Sault Ste. Marie and Sarnia signals being easily read. A further important advantage of the multiple over the single-wire arrangement is that tuning is as sharp as with commercial aerials of the elevated type.

If these results can be quantitatively confirmed and established for all ordinary conditions of soil and atmosphere, their importance can hardly be exaggerated, for it means that a symmetrical multiple earth-wire system having pronounced directive effect can be used for receiving in practical radiocommunication without using greater sending power than for elevated aerials. Further tests appear to be desirable on very wet soil, for notwithstanding the fact that bare wires were used in these tests, the soil surface was mostly dry, and when the outer ends of the wires were deliberately connected to earth, the system would not respond to incident radiation. From the work already done, it seems that an

earth-wire system operates best when its electrical length (including transformer primary) is about one-fourth the incident wave length. The receiving instruments should be inserted about one-third the distance from the end nearest the transmitting station, and to operate at the same efficiency, the total length of the ground-wire system should be about twice that of an elevated aerial.

## ELECTRIC POWER IN INDIA.

By H. R. SPEYER, A.M.I.E.E.

In the two great Indian industrial centres alone there are at work at least 95 cotton and 45 jute mills. Excluding the miscellaneous industries, these aggregate no less than 200,000 I.H.P., of which total at the present time not even 10 per cent. is driven by electricity. It must therefore be clear to all that an excellent field is open to manufacturers for the installation of up-to-date electrical plant in

India.

It would appear, however, that with few exceptions, British manufacturers of electrical machinery have in the past been reluctant to consider seriously the development of an Indian business, apparently not wishing to incur the initial expense essential for systematically canvassing the country.

Half-measures have only too frequently been adopted by British firms by reason of their allocating their selling agency to established commercial firms in India on a commission basis, and almost without exception this basis, and almost without exception this method has proved unsatisfactory.

method has proved unsatisfactory.

Electrical machinery quite unsuited to the working conditions prevalent in India has been sent to that country, and proving unsatisfactory has led mill-owners and their engineers to regard with keen disfavour electric plant for mill or factory working.

It is absolutely necessary for an engineer to be on the spot to nurse carefully any new electric power installation during the first 18 months or two years, or until the mill-owner or his engineers have gained complete confidence in the working of the plant. Only recently two important electrification schemes carried out by one of the leading British manufacturing firms were superseded by steam plant, owing solely to the lack of qualified supervision on the part of the manufacturer's engineer during the erecal period.

tion and probational period. There is no doubt whatever that the time has now come for British electrical manufacturers to realise that if they wish for a British electrical manufacturers to realise that if they wish for a fair percentage of the Indian electrical trade, they must be prepared to send out to the country their very best power men and not merely one commercial engineer. They must further be prepared to establish themselves on their own account in at least the two largest industrial dentres of India, and be prepared to undertake the electrification of miles and factories from A to z and not take the electrification of miles and factories from A to z and not be required to the contract of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the

against c.i.f. or f.o.b. prices. This method would ensure the confidence of mill-owners and their engineers, and such British firms as were established in India in this way would be able in a very short time to build up a lucrative business.

The pioneering work may now be regarded as having been accomplished, and the field for electrical power for industrial purpose in India to-day, is one which if handled to advantage by engineer of experience should yield a handsome return to the m inufacturers

Since 1907 electrical imports have increased from £155,000 to £198,000, while steam plant imports have fallen from £800,000 to £310 0 00 in 1912.

£198.000, while steam plant imports have raisen from £800,000 w £310 0 00 in 1912.

During the last few years a very great proportion of the electrical plant installed in India, together with hydraulic and steam turbines, has been supplied from the Continent. Table I embodies the chief data of the five most important public electric supply undertakings in India; of 66,900 kw. of plant installed in these stations Switzerland has supplied 54,000 kw., England only 7,500 kw., and the United States 5,400 kw. of the prime-movers, whilst Germany has supplied no less than 32,000 kw., the United States 17,000 kw., Switzerland 10,000 kw., and England only 7,500 kw. of the electrical generating plant. In the author's opinion this is due chiefly to the greater standardisation covering a large range of voltages, in many cases from 220 to 6,000 volts, which allows foreign manufacturers many opportunities of putting forward standard plant where British manufacturers are obliged to quote higher prices to cover special construction; and in addition the time required for delivery of the plant in the case of the British firms will in the majority of cases be considerably in excess of that of the Continental firms. It must also be born in mind that Continental makers are fully alive to the conditions under which electrical plant has to work in India, and have spent both time and money in experiments before deciding on the

^{*} From the Journal of the Institution of Resourced Engineers (Abstract).

^{*} C. A Calver and J. A. Riner. Electrical World, 1915, p. 723.

standardisation of plant intended for export to a tropical country. Except in some isolated cases, however, the same cannot be said of the majority of British electrical manufacturers, or else the author's experience has been unfortunate. The reason for this deployment of cases to be deplorable lack of enterprise appears in the majority of cases to be due simply to the lack of experience on the part of British electrical firms of the unfavourable conditions prevalent in India; and as soon as greater experience has been gained with the working

100,000 I.H.P., the success of this scheme would have been assured, as it is quite possible that had capital been forthcoming, substantial guarantees would have been obtained from the mills and factories for the supply of current to replace existing steam plant. It is an encouraging fact that the Tata hydro-electric scheme has been realised in Bombay, but it is to be regretted that the whole of the capital had to be found in India after an opportunity had been given to English capitalists.

conditions, it is to be hoped that British firms will bring their manufactures into line to meet the requirements of the Indian market.

It must be remembered that during the Indian "rainy" season, which lasts each year from June to Ostober, the humidity reaches a figure of 95 per cent., with a temperature often of 98° F., and in the mills, factories, and engine room a temperature of 115-120° F. is often recorded. The temperature of water available for condensing orten recorded. The temperature of water available for contenning purposes during the hot months, even when taken direct from the river or other couroes of supply, often reaches 95° F, with the result that in the case of turbine plant, the economical steam consumption of which depends so largely on a good vacuum, it is essential to install condensing plant of a much larger capacity than is usual at home.

The effect of these adverse climatic conditions on the insulation of electrical apparatus for high-tension plant recently led to a controversy as to whether it was advisable to install 6,000-volt motors, at which pressure a supply of electricity for power purposes is available at cheap rates in two of the largest industrial centres in India, or able at cheap rates in two of the largest industrial centres in India, or whether it was preferable to interpose transforming plant, reducing the pressure to 500 volts for the supply to the motors. A large percentage of "burn-outs" on low-pressure motors (220 500 volts) has been directly traceable to the humidity, and it was thought by a number of engineers that the installation of high-pressure motors would be coupled with the risk of a still greater number of breakdowns due to this cause. It seems, however, to the author that the insulation on the average low-tension motor present internal short-circuiting between successive turns. author that the insulation on the average low-tension motor to prevent internal short-circuiting between successive turns due to the difference of potential between them, is insufficient to prevent the percolation of moisture from an external source, whereas the insulation necessary on 6,000-volt mains to prevent internal short-circuiting due to the potential difference between successive layers, is more than sufficient to prevent the percolation of moisture from an outside source. The author has in many cases supervised the installation of motors to run at 6,000 volts, and, with one exception, excellent results have been obtained one exception, excellent results have been obtained.

Another factor which has hampered the development of electricity for industrial purposes in India during recent years has been the lack of English capital for projected industrial enterprises for utilising either water power or coal near the pit's mouth for the generation of electric power for transmission at a cheap rate for mill and factory use.

In the collieries of Bengal, which raise no less than 12,000,000 tons of coal per annum, a sound practical scheme was projected a few years ago for the centralisation of a power house for supplying electric power to the collieries in general, but owing to the lack of both capital and co-operation between colliery owners, the scheme fell through, with the result that there are now scattered over the fell through, with the result that there are now scattered over the coalfields a number of small electric power houses working with both unfavourable power and diversity factors, so that the economy it was hoped to achieve by the use of electric power, has to a great extent not been realised. The coal consumption at the coalieries indicates that at least 85,000 B.H.P. is awaiting electrically.

Another favourable project which fell through owing to lack of capital was the Mourbhunj water-power scheme, which contemplates harnessing the water power available at Mourbhunj for providing a cheap source of electric supply to the mills and factories in and about Calcutta. Taking into consideration the fact that the 85 mills at work in the vicinity of Calcutta utilise altogether approximately

Had the money been found in England there is little doubt that arrangements could have been made for the installation of English plant, whereas with the exception of the motors and transformers for the mills, the whole of the 60,000 H.P. of generating and transmitting plant has been purchased from the Continent and from America (see Table I).

There is, however, no doubt that the visit of His Mojesty King.

America (see Table I).

There is, however, no doubt that the visit of His Majesty King George to India in 1911 served in a large measure to focus the attention of the British public on the country, and from the glowing reports which appeared at the time on the prosperity of the country and its development, it is to be hoped that financiers will have at last realised that the resources of India offer a reliable and safe investment for capital.

(To be continued.)

## LOAD FACTOR, OUTPUT AND COST.

## BY C. ASHMORE BAKER, A.M.I.E.E.

In the field of electricity supply, when one attempts to compare the economic results of one undertaking with another, one finds

the economic results of one undertaking with another, one finds the most astonishing discordance between concerns working under substantially similar conditions as regards matters of primary importance such as size, load factor, locality, &c.

Take, for instance, two towns, A and B. Both inland provincial towns, outside the coal areas, both municipal undertakings, both giving three-wire direct-current supplies at approximately the same voltage, both having maximum loads equal within 10 per cent., and almost exactly equal load factors, and yet the working expenses per unit sold are in one case over 50 per cent. higher than they are in the other. they are in the other.

Again, compare A and C, whose load factors are not very different, 17 6 and 16 7 respectively, and yet although their maximum loads vary as 1:22, their respective total working costs vary

only as 1:113 (13 per cent.).

I mention these facts for the purpose of drawing attention to the danger of comparing one undertaking with another, or with a relatively small group of others selected according to some particular plan.

In order to obtain a knowledge of the relative economy of any undertaking, it should be compared with a very large number of other undertakings, so that the influences of purely local or psycho-

other undertakings, so that the influences of purely local or psychological conditions may become negligible.

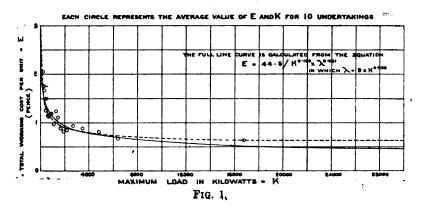

It is the object of this article to suggest means for such comparisons, to illustrate methods of applying them, and to draw attention to some of the more interesting results thus obtained.

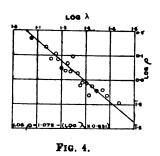

Influence of the Size of Undertaking on its Working Costs.—The data I have made use of in preparing this article are those comprised in the annual tables of the Electrical Times for the year 1911-12. 1911-12.

If we take two columns of these tables, such, for instance, as maximum load and total working costs per unit, and if we plot them on squared paper, it will be obvious at first glance that although the variation from the mean may be considerable in the case of any one undertaking, there is, nevertheless, a tendency for

the two co-ordinates to be related in a definite way, which might be represented by a mean curve drawn through the points plotted.

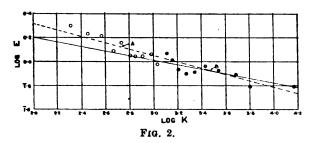

We can obtain a closer approximation to what this mean curve should be like, if, instead of plotting each undertaking separately, we plot the averages of similar groups. Taking the returns already alluded to relating to local authorities, and omitting all such undertakings as purchase a supply in bulk, we have a list of some 200 concerns. Arranging these in the order of their maximum down our list of towns in the order of their respective load factors, instead of in that of their respective loads. - But there is a distinct relation between "maximum output" and "load factor," as will be seen from an examination of fig. 3, in which are plotted as co-ordinates the mean maximum loads of our 20 groups of towns and their corresponding load factors (indicated by the symbol  $\lambda$ ). In order to discover the influence of  $\lambda$  on the cost of production, we must be able to eliminate the influence of  $\kappa$  and vice versá. Of  $\kappa$  220

loads, and subdividing them into groups of 10 consecutive towns each, we can plot the mean load of each group of 10 towns against the mean of their total working costs; this will give us the points

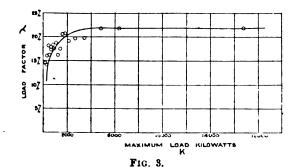

In this diagram, although the values plotted are still somewhat irregular, they indicate that a mean curve drawn through them would show a close family resemblance to an hyperbola. If instead of plotting our co-ordinates directly we plot their logarithms as is done in fig. 2, it at once becomes obvious that the relation between the co-ordinates is so nearly a straight-line law that any departure therefrom is not of great importance. Now it is a simple matter to find the mean of a number of

oc-ordinates following a straight-line law. All we have to do in this case is to divide our undertakings into two groups, one containing the 100 larger concerns, and the other the 100 smaller ones. taining the 100 larger concerns, and the other the 100 smaller ones. For each of these two groups we add together the logs of all the maximum loads and likewise the logs of all the working costs; we then divide each of these four totals by 100, and we have as the result two pairs of co-ordinates which we can plot on our squared paper (A and B, fig. 2). A straight line ruled through these two points represents the mean of our separately plotted co-ordinates. The empirical law connecting maximum load and cost per unit sold (neglecting for the moment the influence of load factor) for municipal electric supply undertakings is found by projecting the straight line back until it intersects the vertical ordinate representing zero on the horizontal scale, and calling E the cost per unit sold and K the maximum load in kilowatts, we have—

Log E = 0.84 — (log K 0.265),  
E = 
$$7/K^{0.265}$$
... ... (1)

But here a digression is necessary. The cost of production is influenced by the load factor of any given undertaking, as well as

by its output—so much so, that it is useless to attempt to establish any standard of comparison which does not take this influence into account.

We may ascertain approximately the influence of load factor on the cost of production in a manner similar to that employed for ascertaining the influence of maximum output, namely, by setting

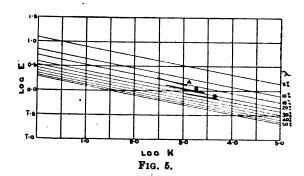

Now, it will be seen on examining fig. 3 that for plants above Now, it will be seen on examining fig. 3 that for plants above a certain size, the load factor does not vary much as a function of output, thus for the first three groups of towns its average is constant at 21.7 per cent., while the whole of the first 10 groups comprising 100 undertakings give an average load factor of over 20 per cent. If, therefore, we calculate our K E formula afresh from the results obtained by these 100 undertakings, we shall obtain an equation connecting E and K, in which the disturbing element anters to a negligible extent. enters to a negligible extent.

This equation is 
$$\log E = 0.577 - (\log E \times 0.189)$$
,  
 $E = 3.78 (E.0.189)$ 

This equation is  $\log E = 0.577 - (\log E \times 0.189)$ , or  $E = 3.78/K^{0.189} \dots \dots (2)$  and the logarithmic graph is represented in fig. 2. Here it will be seen that the full line which represents this equation passes through the mean of the first 10 points, represented by dots; the remaining 10 points represented by open circles, and composed of groups of towns having generally somewhat smaller load factors, fall above the full line. fall above the full line.

We are now in a position to study separately the influence of load factor on the working costs, and for this purpose we can employ, as has been said, the same method as that adopted for

studying the influence of maximum load. Thus, if we re-arrange our towns in groups of 10 in the order of load factor, commencing with the highest load factors, we again obtain 20 groups of undertakings, each of which will give us a pair of co-ordinates, but in these co-ordinates the disturbing influence of maximum load comes in, because the average value of the load is not the same for each group. If, however, we calculate from equation (2) what the cost should be with the average load factor of the 100 largest undertakings, and divide the actual average cost by this calculated figure, we shall obtain ratios varying from group to

group according to the mean load factor of each group, which ratios can be plotted as co-ordinates of their corresponding load factors. The logs of these co-ordinates are plotted in fig. 4.

The equation corresponding with this diagram, calling p the ratio of the actual to the calculated value of E, is

Log 
$$\rho = 1.072 - (\log \lambda \times 0.83)$$
, or  $\rho = 11.8/\lambda^{0.681} \dots \dots \dots (3)$ 

The quantity  $\rho$  is obviously a coefficient by which we must multiply a result obtained from equation (2), in order to make due

allowance for the influence of load factor.

These two equations combine into the expression

$$E = \beta/(K^n \times \lambda^n),$$

in which E is the total cost of production per unit sold, \$\beta\$ is a constant representing the value of E when K and  $\lambda$  are unity, and  $\pi$  and  $\eta$  are powers of K and  $\lambda$  respectively. Giving  $\beta$ ,  $\pi$  and  $\eta$  their numerical values, we obtain the equation

$$E = 44.5/(K^{0.160} \times \lambda^{0.63})$$
 ... ... (4)

. From this equation a diagram (fig. 5) has been prepared, showing the logarithms of E for various values of E and  $\lambda$ . It will be

seen from this diagram that for each value of  $\lambda$  a straight line alopes downward from left to right. The height of its intersection with the ordinate representing 0 is obviously the calculated value of **B** when  $\mathbf{K} = 1$ , viz.,  $\beta | \lambda^{0.81}$ , while the alope of the line (that is, the vertical distance of any point on it below the point of origin divided by the horizontal distance of the same point from zero) is 0.120. is 0'189.

Component Items in the Cost of Production.—The method we have employed for discovering an equation correlating the total cost of production per unit sold with  $\kappa$  the maximum load for the year, and with  $\lambda$  the load factor, may be employed in an exactly similar manner in order to obtain analogous equations, correlating  $\kappa$  and  $\lambda$  with the separate heads of expenditure of which  $\kappa$  is made up

It is not necessary to enter into the details of these calculations. It will be sufficient for the purposes of this article if the results are available. These are given in Table I, in which the constant  $\beta$  and the exponents n and n of n and n respectively are given for each item. These data are calculated from the averages of 200 municipal undertakings made up. municipal undertakings.

Sym- bol.	Description of item.	Log β	β	n	η
F	Coal and other fuel	0.694	4.95	0.193	0.418
ō	Oil waste water and stores	0.314	2.06	0 351	0.284
w	Wages of workmen	1.394	24.8	0 332	0.951
Ř	Repairs and maintenance	0.716	5.19	0.125	0.894
T	Bent, rates and taxes	0.267	1.85	0 092	0 821
M	Management, salaries, office and legal expenses, insur-				
	ance, &c	1.470	29.5	0.251	1 174
B	Total working costs	1.649	44.2	0.189	0.831
P	Average price received (total supply)	1.949	88.9	0.113	1.027

As an illustration of the use of this table, suppose we wish to find out if the cost per unit for, say, fuel, in a concern in which we are interested is above or below the municipal average.

The maximum load and the load factor we will assume to be

3,000 kw. and 16 per cent. respectively, while the actual coat for fuel is, let us say, 0.3d. per unit sold.

Now the average municipal cost is—

 $F = 4.95/(3.000^{6.198} \times 16^{6.418})$ , whence F = 0.331.

The fuel costs for the undertaking in question are thus  $(0.3/0.331) \times 100 = 91$  per cent., or 9 per cent. below the general average.

(To be continued.)

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communi-cations at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### Cab Signalling.

In view of the large number of mistakes that have been made by the Board of Trade and the railways respecting electrical signalling equipment, Mr. Ogden's exceedingly informing letter is very opportune.

Since Mr. Ogden's criticisms appeared, one technical journal has named the British railways that have adopted or tested cab signalling systems of various sorts. But judging from well-known facts, one is tempted to marvel at the unscientific and unbusiness-like way in which the railways and the Board of Trade have handled this matter.

If a real and satisfactory preventive of a certain numerous class of wrecks still remained undiscovered, one could understand why British railways in some instances had adopted, and in other cases were still experimenting with, very faulty kinds of cab signals. But inasmuch as a genuine preventive has been known to railway officials for at least four years, and to thousands of other persons for about half that time, two things are, to put it mildly, quite strange. One is that no railway has even tested the only satisfactory cab signal extant; the other is that no Board of Trade Inspecting Officer has ever taken the trouble to recommend a trial of this signal.

Some time ago, one technical editor published, as his own opinion, the statement that Mr. Dammond had "the sanest ideas" as to cab signals that he (the editor) had ever seen presented. Those who, like myself, saw Mr. Dammond's full-size tests, and have no interest in any signalling system, are strongly of the same

I think Mr. Acfield knows very well that Mr. Dammond has "made an advance" on the Great Western cab signal. Why, then, has the Great Western been allowed, and the Dammond refused, a test on the Midland Railway?

Along with other visitors, I was invited by Mr. Dammond to produce as many earths as we wanted in his full-size equipment. We did so, and every resulting error was a safe one. We were also invited to produce any number and any combination of earths and open circuits we wanted; and we did not get a dangerous error

any time we tried. Has not Mr. Acfield had the same opportunities

as we to test the Dammond system?
Will the "railophone" or the Great Western equipment on the Midland Railway pass these important tests?

May 24th, 1915.

THE ELECTRICAL

#### Cable Shortage.

I happened to visit a job the other day (a three-phase one) and found two men about to pull in six 7/14 cable into two pipes. The found two men about to pull in six 7/14 cable into two pipes. The total length of the pipes was 54 ft. 2 in., and allowing very sparingly for tails at main switch, motor and starter, I decided to cut each length 55 ft.  $-6 \times 55$  ft., being a complete 110-yard coil. A coil of cable by a well-known make unwrapped, measured out and cut, but to my, I may say disgust, the last length only measured 42 ft. 7 in., making a total of 317 ft. 7 in., or a shortage of 12 ft. 5 in of 12 ft. 5 in.

of 12 ft. 5 in.

Out of curiosity I measured two coils of a smaller size and found one to be 1½ yards short, while the other one was actually 5 yards over. I should very much like to know how the cable makers arrive at the length before labelling the coils 110 yards. Is it weighed or measured? During these times of keen competition and dear material, every contractor requires his full pound of flesh, and 1.760 wards to the mile. and 1,760 yards to the mile.

and 1.760 yards to the mile.

Coils of cable, such as the one I have described, may mean the difference between profit and loss, and I would be interested to find out other contractors' experiences in this direction.

If one item on the label is incorrect, namely, the length, what satisfaction is there in insisting on seeing the label for insulation

I trust that a few observations like this may lead to closer attention on the part of our manufacturers to ensure weights and measures, as well as their well-known quality, thus combining quantity and quality.

Contractor.

## Automatic-Lift Accidents.

I am glad that such an authority as Mr. Frank Broadbent has brought up the subject of electric-lift accidents.

brought up the subject of electric-lift accidents.

Lift accidents seem generally to fall under two headings, namely, those in which injuries are caused to persons by the opening of doors when the lift is away, and those in which injury is caused to the person in the cage or car. My experience goes to show that the latter are the more common.

As Mr. Broadbent has dealt with the first, I will confine myself

to the second class.

First case. Car switch lift, serving four floors of offices. On one occasion, when the lift was ascending, the foot of a lady passenger projected beyond the edge of the car, and became trapped at the next landing. As a result the toes had to be amputated.

amputated.

Second case. Full automatic push-button lift with gate contacts. A visitor accompanied by a boy ascended, the boy being told to wait in the lift. For some reason the gate was closed; it could never be ascertained whether the lift was called, or the boy pushed one of the buttons, but it was clear that he attempted to get out while the lift was moving, with fatal results.

Third case. This only occurred a few months ago, and may be described rather more fully. The lift in question was situated in a warehouse, and was chiefly used for packages about 2 ft. cube, averaging \(\frac{1}{2}\) cwt. Its travel was about 100 ft. per minute, was controlled by a handrope, and worked by a regular attendant, a man rather past middle age, but quite able bodied. There were the usual double-pole switch and fuses in the basement, and an additional double-pole switch and fuses on the top floor, where the

usual double-pole switch and fuses in the basement, and an additional double-pole switch and fuses on the top floor, where the motor, gear, &c., were also situated.

On hearing a cry one day a man, working on the top floor, rushed over and opened the double-pole switch.

The unfortunate lift operator was found so badly orushed between the floor of the cage and the landing that the flooring had to be cut away in order to release him. As life was extinct and there were no even order to release him. As life was extinct and there were no eyewitnessee, what actually occurred could only be conjectured, but
what apparently happened was this: The cage was well loaded,
the packages being placed on top of one another, leaving very little
room for the operator. One of the packages appeared to have
toppled over and knocked the attendant forward, possibly pinning
him down or jamming the handrope, with fatal results. A
fatality having somewhat similar features is recorded in the
fatality having somewhat similar features is recorded in the
fatality having somewhat similar features is recorded in the
fatality having somewhat similar features are:—

First, that every lift should be fitted with gates to the cage or
car, preferably with gate contacts.

Secondly, that the time is more than ripe for a clause to be
embodied in the Home Office Regulations to cover electric lifts.
Apparently as long as the motor is earthed and the fuses are not
on the live side of the switch nothing else matters.

on the live side of the switch nothing else matters.

It is, perhaps, hardly necessary to mention that every lift should be periodically inspected by someone competent to do so.

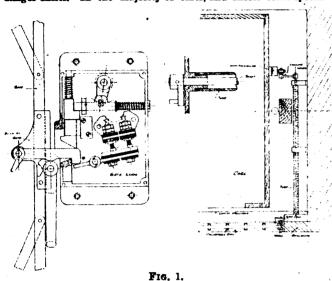

Ernest F. Butler. London, W.C., May 24th, 1915.

P.S.—I should be glad to know if any reader has succeeded in maintaining an arc on a door or gate contact when opened. I often tried to do so, but have only been successful on one

In connection with Mr. Broadbent's excellent article under the above heading, which appeared in your issue of May 14th, we notice that he draws attention to two points in the design of electrc-mechanical locking gear, which are capable of improvement:—

The first point is one which is easily overcome by placing the lever which actually looks the gates either at the "far" side or at the back of the car. This lever should rotate a shaft which is enclosed in a tube screwed into the lock, so that it is quite imposenclosed in a tube screwed into the lock, so that it is quite impossible to tamper even wilfully with the locking mechanism; such an arrangement is shown in fig. 1. The lock is fixed in the centre of the gate, as this is the point at which most force is applied; this is important, as with some locks fixed at the top of the gate it is often possible, by pulling at the lower end of the leading spigot of the gate, to bend it in such a manner as to release the catch.

The second point is the most important, as it is here that a real danger exists. In the majority of cases, and unless some special

device, such as we illustrate in fig. 2, is fitted, it is possible for anyone to open a landing gate or door as the lift cage passes. To obviate this possibility, we have designed a "pilot" or "car switch," which, when rotated into the "up" or "down" positions, operates a movable "ramp" through the medium of Bowden wire mechanism, in such a manner that the "ramp" is raised, and the gate actually locked, before the lift moves away from the floor, also the gates on the floors which the lift passes are not unlocked, and it is thus quite impossible for an accident such as Mr. Broadbent has described to take place. The only gate which is

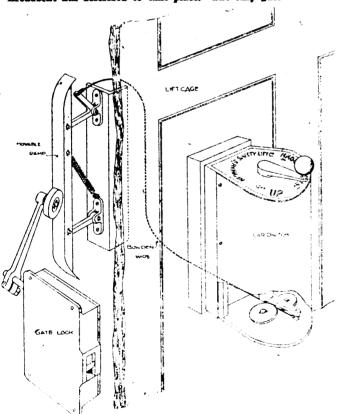

FIG. 2.

unlocked is that on the floor at which the lift stops, and even this

gate is not released until the lift has come to rest by the car switch bandle being moved to the "off" position.

The same arrangement can be fitted to push-button lifts and the "ramp" can be lifted either mechanically by the closing of the

inner cage gate, or by a solenoid.

It will be appreciated that this device is extremely simple and unlikely to get out of order, and it is, moreover, a purely mechanical job which could not be "short-circulated" by a lazy or incompetent engineer-in-charge. Unfortunately, however, these extra safety devices increase the first cost of the lift, and unless the purchaser is an engineer or employs a consulting engineer to act for him, the necessity and advantage of these safeconsulting

guards is often not appreciated.

The defects which Mr. Broadbent calls attention to exist in a greater or less degree in the majority of lifts in this country, while, in addition, in many cases no look of any kind is fitted, and when it is considered that the electric passenger lift is as much a public vehicle as say the motor-omnibus or taxi-cab, it is surprising that no special rules have been drawn up, to enforce the adoption and maintenance of suitable safety appliances.

For Medway's Safety Lift Company.

M. D. SCOTT.

London, S.E., May 25th, 1915.

The article in your this week's issue by Mr. Frank Broadbent does not do justice to the efficiency of the safety devices which are at present being used by the best makers. The form of doorlatch indicated by his sketch is, doubtless, the prototype of these devices, but the existing mechanisms do not permit of the conditions arising which Mr. Broadbent rightly criticises. The requirements of a satisfactory lock are: quirements of a satisfactory lock are:—
1. It must be impossible to unlatch any door normally, unless

the lift be at that door.

2. It must be impossible to move the car if any door be open.
3. It must be impossible to move the car from any door unless that door be latched.

4. It must be impossible to unlatch the door at which the car is

standing immediately current is applied for moving the car.

5. It must be impossible to unlatch the door while the car is passing that door without stopping.

6. The car at the landing should put the mechanism in a permissible condition for unlatching the door without actually unlatching it. A manual operation must follow to unlatch the door.

7. The device must be independent of springs or other appliances for its safe functioning.

Devices are at present in use which fulfil all these conditions, and the writer ventures to suggest that had such a device been used the socident could not have taken place.

used the accident could not have taken place.
Surely this is an opportune moment for inducing some recognised authority to formulate a set of rules to which all lift makers must conform if they desire to have their lift passed for service. Such rules exist in a great many foreign cities, and are generally administered by the police. The London County Council could make itself the authority in this matter and insist that no lift be passed for service until it were officially inspected and approved, a procedure which this body has adopted in other instances where public safety is concerned.

Gilbert Resembusch.

Gilbert Rosenbusch.

London, S.W., May 15th, 1915.

## INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

HYDERABAD (Deccan) is the premier Native State in India. It has an area of 82,698 square miles and a population of 13½ milliona. The principal city is Hyderabad, and not far distant is the military cantonment of Secunderabad, where a British infantry regiment is generally located. Electric power was first made use of in the Nizams' palaces about 10 years ago. Additional plant was laid down from time to time, and now the capital city can boast of a very fine electric installation equipped on the most modern linea. It is expected that two new steam turbine sets, each of 1,500 kw. capacity at 3,300 volts A.C., will shortly be put into commission; these should be sufficient for all ordinary wants for several years to come. The greater part of the electric power is used for lighting and fans for the Nizams' palaces—of which there are several.

The Mint and State workshops also consume a fair proportion

and rans for the Nizams palaces—of which there are several.

The Mint and State workshops also consume a fair proportion of the output, and the private consumer and street lighting call for a considerable load. The street lighting is on the glow lamp series principle, with constant current transformers in circuit, and automatic "cut-ins" in case of failure of individual lamps. Most of the principal streets of both Huderahad and Sacundarahad are automatic "cut-ins" in case of failure of individual lamps. Most of the principal streets of both Hyderabad and Secunderabad are lit with very satisfactory results. Mr. Gamlen is responsible for the design and lay-out of the modern part of the electric equipment, and has carried out his work in a highly commendable manner. In his twofold capacity as mint master and chief electrical engineer he is a tremendously busy man, and gives the State the best that is in him.

best that is in him. A huge dam is now being built not far from the lake to impound A nuge dam is now being built not far from the lake to imposine the surplus water of an extensive catchment basin. Primarily this is intended to prevent the possibility of any further floods—such as the coloseal one of a few years back, which caused untold damage to life and property; incidentally, it is expected that the water throttled back by this dam may at some time be used as "white coal" and through the account hadro-cleartrically

throttled back by this dam may at some time be used as "white coal," and turned to account hydro-electrically.

From the size and population of Hyderabad State it may be thought that large possibilities of electrical business should present themselves; but just yet this is not so. The population is mainly agricultural, growing cotton, rice and general foodstuffs. There are a few manufacturing industries such as spinning, weaving and ginning mills, but these are in a comparatively small way. Under the sway, however, of a progressive ruler, whose word is absolute law, one may expect developments in electrical as well as in other engineering lines.

## THE POWER SUPPLY OF THE CENTRAL MINING-RAND MINES GROUP.

MR. J. H. RIDER'S paper, of which we have published an abstract in recent issues, was discussed at a meeting of the Yorkshire Local Section of the Institution of Electrical Engineers at Leeds on Wednesday, May 12th.

Mr. Wright said he felt, as a manufacturer, that there were a good many points of great value in the paper, for the reason that it was often said that manufacturers' failings, especially in regard to plant and switchgear, were particularly to be found in the fact that they limited their experiences to the actual process of manufacture, and not to the actual working of the machinery and switchgear which they produced. Therefore, the failures mention in the paper were of great value to manufacturers of plant. It was often the practice of manufacturers of three-phase motors to earth one of the slip rings, but he assumed that that method would not be allowable in any of the motors installed on the supply dealt allowable in any of the motors installed on the supply dealt with by the author, for the reason that if they had an earthed slip ring and a liquid starter, when they started up they would have one of the phases short-circuited. He did not think it was good practice to earth one of the slip rings. With reference to the dimensions of the minimum radial air

With reference to the dimensions of the minimum radial air gap, it worked out as a very fair average for moderate speed motors, but he did not quite understand the last figure in the formula, namely, "minus .25."

Mr. Burnand said he had been interested in the braking with reverse current on the three-phase motors. The amount of energy wasted for the purpose of braking was really very large, and he wondered if the author had had any experience of putting direct current on to the primary of the three-phase winding motor; by that means they got quite an efficient brake, though he doubted whether they would brake down to quite as low a speed as they would be using the eddy-current brake described in the paper. The saving of energy would, of course, be very great—they would only use, perhaps, about be per cent. of what was used by reverse current braking. He did not care very much for carbon brushes on the slip rings, preferring copper cores impregnated with braking. He did not care very much for carbon brushes on the slip rings, preferring copper cores impregnated with graphite. With regard to oil rings, it was always desirable to be able to see the rings move, and there ought to be at least two rings. From the rather painful record of troubles, it appeared that the motors were all supplied by firms of worldwide repute, and he thought the fact that troubles such as the author had mentioned were possible, pointed to a very loose and unbalanced organisation. Many engineering works were run by commercial men rather than by engineers, and if the latter had control they would get a better balanced system of inspection and supervision than had previously been the case.

been the case. Mr. Shepherd said they were indebted to the author for Mr. Shepherd said they were indebted to the author for giving them such a full and candid opinion of the troubles which he, in common with all users of large plant, had found. With the experience which people had had now there was no excuse for any motor having a frame which was not of sufficient stiffness, particularly when such machines were subject to rapid reversals. Soft or loose cores were quite inexcusable. He knew of several cases where very large plants had given way owing to the external dovetail keys being insufficient in size and insufficiently secured in the circumferential frames to which they were attached. He had always

had given way owing to the external dovetail keys being insufficient in size and insufficiently secured in the circumferential frames to which they were attached. He had always insisted on the core plates being secured to external dovetails, and, as a further precaution, he had always found it better to fill in all spaces—if there were any between the keys—with white metal. He thought other people should follow the author's example in giving descriptions of plant which gave trouble or, rather, descriptions of the trouble experienced, because then engineers could soon come to some definite opinion as to what plant was good and what was bad.

Mr. Yerbury said he was pleased the author had mentioned the troubles he had experienced. He recalled instances of motors with too fine clearances, and in which the slip rings had been made of what appeared to be yellow brass instead of iron or gun metal, and where springs had entirely failed in brush-holders in a short time owing to dust accumulating in the holders. With regard to starting and running resistances, he found in many cases that there had not been a sufficient clearance for air—instead of its being properly circulated it had become stagnant. He was glad the author pointed out the desirability of modifying the proposals of the Engineering Standards Committee with regard to machines and apparatus designed to work within certain limits of pressure. He had had experience of rheostats failing when the pressure was reduced, owing to over-heating having taken place, and had always found that an ample margin of copper and attention to small details had proved a very desirable investment.

Mr. Thackery drew attention to the question of who decided the purchasing of the machinery in South Africa: he sue-

Mr. THACKERY drew attention to the question of who decided Mr. THACKERY drew attention to the question of who decided the purchasing of the machinery in South Africa; he supposed it was purchased against the specification which somebody had drawn up. He did not think it was altogether the manufacturer who was at fault, because if he put forward against a specification what was demanded, the order generally went to the lowest tenderer, and if there was no specification that the manufacturer was working against, it would not be wise for him to put in big air gaps and open slots, because he would lose the order on price. It was far better to have a metor which would stand rough usage than one which was very highly efficient, because the cost of repairing the machine was so much more than the extra cost of a reliable motor.

Mr. McClay said the author did not tell them whether the

mining companies found the change-over from steam to electric operation financially advantageous. No doubt, from the power company's point of view, the whole thing had been financially successful, but he would like to know what it had

mining companies found the change-over from steam to electric operation financially advantageous. No doubt, from the power company's point of view, the whole thing had been from the consumer's point of view, the whole thing had been from the consumer's point of view, the whole thing had been from the consumer's point of view. In this country they found it extremely difficult to persuade people to use electricity and to convince them of the savings to be effected by so doing, and he would like to know how they had done it on such an enormous scale in South Africa.

The CHAIRMAN (Mr. T. Roles) said he would like to know how the concerns for which the author had acted, viewed the matter of buying current from a power company as against providing plant of their own. In Yorkshire they often had great trouble in persuading large power users to obtain their supply in bulk from a power supply undertaking, and the private plant still flourished to a very great extent, notwithstanding the fact that prices for current were in many cases very cheap. He agreed with the author in regard to having a proper reserve of generating and transforming plant. Many undertakings had experienced trouble owing to having a very small margin of plant, and many corporation undertakings had been staved of the necessary plant to keep up a proper supply, and had had the pay for it as a result. His idea of reserve plant was that in the case of, say, four turbines, they should have one machine always standing by and another one which could be taken down for repairs at any time.

Mr. Rider, in replying to the discussion, said he had never come across a slip-ring motor with one ring earthed. He had not tried using direct current on three-phase stators for braking, because he considered that the complication was too great and he would have had to use a motor generator. If he had to go in for direct current at all, he would rather have a Ward Leonard winder and have done with it. The troubles he had mentioned taught a great deal if approached in the "I want £500 for that machine, and it ought to be £600," it was that man who was the dishonest one, and not the purchaser. If £600 was required for the machine, that amount should be asked for, and if a manufacturer came in and asked for £500 he was playing a low-down game on the purchaser in order to get the work for his shop, knowing he would give something that was not good. If the purchaser had a price put to him by the manufacturer he ought to be able to assume that he was dealing with an honest man, and was justified in taking the lowest price. In his own opinion an efficient machine was one which would do its work day in and day out as long as he wanted it to do it, and would not break down. In reply to Mr. McClay, he said that the change over from steam to electricity and from the old mine steam-driven compressors to the central air supply had been most successful from a financial point of view, and if anybody doubted the advisability of taking energy in large quantities from a respectable power company, he could assure them they need have no further hesitation at all. The firms looked upon the question of buying power from a company instead of getting it from their own plant from the point of view that if they put down a power station to electrify their mines it would cost, say, £750,000, and they could employ that money better in developing their mines. Therefore, they used the money in the mines, and the power company was left to raise the extra capital, and the firms bought their supply from the company. He thought that was a wise view to take, and he would always recommend anybody, if the circumstances were at all similar, to do the same thing. He expressed his agreement with the Chairman as to the desirability of having a at all similar, to do the same thing. He expressed his agreement with the Chairman as to the desirability of having a reserve of generating plant of about 25 per cent.

## THE BOMBAY HYDRO-ELECTRIC SCHEME.

(Discussion in London on paper read by MB. ALFRED DICKINSON, M.I.E.E., before the INSTITUTION OF ELECTRICAL ENGINEERS, April 29th, 1915.)

THE discussion in London was opened by Mr. ROBERT HAM-MOND, who congratulated the author on a paper covering so many branches of engineering. The turbine plant operated under one of the highest heads so far used; it would be interesting to know why such a high transmission pressure as 100,000 volts had been adopted for such a short distance, and to what extent a saving in line copper balanced more expensive apparatus as compared with, say, a 60,000 or 70,000-volt line. He thought the vertical shaft type of Pelton wheel allowed of more nozzles being used than was the case with the type adopted. In America, he believed there had been trouble with the swinging of lines carried on suspension involved. insulators.

Mr. T. CALLENDER thought Bombay was to be congratulated

insulators.

Mr. T. Callender thought Bombay was to be congratulated on having such a scheme at its door, and on having made up its mind to do better than the conditions existing in English and Continental manufacturing cities and to preserve its beauty.

Mr. J. H. Rider regretted that so much of the plant was of foreign origin; he also thought that a great deal was risked in going in for such a high transmission pressure, and that the efficiency was not improved. There appeared to be a drop of 14 per cent. in line pressure, and that did not agree with a line efficiency of 93 per cent. mentioned. Two separately driven exciters were used, but if one were shut down, and the one running failed, the station would be shut down. Why were not the big units provided with their own exciters? Would it not have been better to use the same voltage for exciters and switch control, so that the battery for the latter could have been used as a stand-by for both services? From experience, he considered belt-driven governors an abomination; they should be direct driven, but the turbine makers apparently would not do this. The author appeared to have deliberately avoided earthing; on the Rand, owing to lightning, they had been driven to earthing at several points. The seven-strand transmission cable offered more surface for corrosion than a single cable. He noted that six-unit insulators were used; the same number of units were employed with only 80,000 volts on the Rand.

Mr. E. Doelly said the belt-driven governor was usual, although the rigid drive had been tried; maintenance trouble arose in the latter case from the transmission of shocks. The security of the pipe joints was due to the water pressure, and this type of joint had been used for over 2,000 ft. head.

although the rigid drive had been tried; maintenance trouble security of the pipe joints was due to the water pressure, and this type of joint had been used for over 2,000 ft. head.

Major-General Berespord-Lovert said this was the first instance of such a scheme being financed on commercial lines in India; the promoters had tried to raise the capital here, but had in the end to obtain it in India. They were wise in obtaining expert advice as to the site of the dams, as an earth fissure might wreck such a scheme; they were also fortunate in being able to rail their plant from the docks to the power house, as this was not usual in India.

Mr. G. V. Twiss congratulated the author on the transmission tower construction; he would have been satisfied with a test to three times working load. He thought the insulator system used on the Rand transmission was of the interlinked suspension type, which was 20 per cent. less effective than the type of suspension insulators used by the author.

Dr. Railing said he supposed the low cost of labour had a great deal to do with the practicability of the scheme. It was an instance of diversity factor at the generating end; the water was stored during three months and used over twelve months. Judging from the data given, the temperature rise allowance in the field coils of the machines at the receiving station seemed fairly high; he would be interested to know the power factor of the line with a view to ascertaining the efficiency. power factor of the line with a view to ascertaining the

efficiency.

Mr. G. F. Sills said in America single-phase transformers Mr. G. F. Sills said in America single-phase transformers were usually adopted, possibly for ease of transport, and this practice was followed by the author, although it would appear that three-phase transformers were cheaper. He assumed that there had been some trouble in regard to right-of-way for the transmission. In Canada, the Hydro-Electric Commission had had to divert its 110,000-volt transmission route at Toronto to avoid crossing certain places, and the towers were placed in Lake Ontario.

The AUTHOR, in a short reply pointed out that a scheme of

The Author, in a short reply, pointed out that a scheme of that magnitude could not possibly have been carried out except by a combination of specialists, and any credit must be shared by those who had controlled the various sections of the work. In the lake area, as much as 540 in. of rain had fallen in 90 days, but some years it was much less. It was found that the valleys were full of land crab holes, indicating that water were always there and this was one reason for the that water was always there, and this was one reason for the use of the sites chosen for the dams.

Petrograd Telephone System.—The Petrograd telephone concession lapses in 1919. Down to 1/14 January, 1914, the development had cost 9.195,303 roubles. The decision as to its further exploitation must be taken in 1916. It is calculated that by 1/14 November, 1919, the subscribers will number 75,000, and a further concession, say for 18-20 years, should be based on 150,000 subscribers by the end of that time.

#### 0FTHE ELECTRICAL FUTURE BELGIUM.

THERE are in our midst a considerable number of Belgian electrical men who are waiting for the Allied Forces to drive out the somewhat firmly-entrenched invader. They naturally desire nothing so much as to return to their native soil, and resume as far as may be their former occupations; but while they remain with us they are anxious to turn to good account their expert knowledge of electrical affairs in Belgium. In that country, as in others, Germany played the card of economic domination in advance of military occupation. The gallant Belgian people, battered with mailed fist and trampled under foot meanwhile, will rise again, and in doing so they wish to snap for ever the shackles of domination of both kinds. We are strengthening our national organisation to break asunder those brutish military bands—what of the economic ones?

Reference to later pages of this issue will show that an effort has been made by Belgian gentlemen to secure the co-operation of British electrical firms in breaking the German economic hold upon Belgium's electrical trade. are not sure that their preliminary effort was launched under auspices the most likely to secure success-indeed, we are not quite clear as to what those auspices actually are—but we believe that we represent the position correctly when we say that British electrical firms, whose co-operation is sought, and who at heart, we believe, desire to co-operate, can hardly have been aware of the existence of the movement. We do not for one moment believe that the electrical industry, however busy it may be making shells, would, as a whole, have cold-shouldered a meeting called by the electrical refugees of a nation for which we unanimously have so high a regard. Had the event been announced in time for us to notify our manufacturers and commercial men through the electrical Press, there might have been a reasonable number of British electrical men present to hear the excellent paper that had been prepared by M. R. Steylaers, and to show that as an industry we are not apathetic or disinterested in regard to the electrical future of the stricken country.

However, the slip that we suspect to have been made in the preliminary organisation need not, and should not, stand in the way of suitable fraternisation between Belgian and British electrical engineers, or prevent an adequate discussion of the situation as it was and as it ought to be, and of the best means for bringing definite and practical cooperative effort into being.

In order to assist to that end we have devoted space to-

day to the publication of M. Steylaers's full statement, and we desire to ask our directors, principals, and managers of electrical businesses to study it with a view to discussion. It is proposed to hold a further meeting at which this paper shall furnish a basis for such discussion, and we hope that a goodly number of the aforesaid business men will find it convenient to attend and offer their observations upon the subject. It was obvious that our Belgian friends had somehow or other, somewhere or other, gained an unfortunate impression of the electrical manufacturers of this country, and if our firms had known of the meeting the impression might have gained some justification from the fact that they almost unanimously refrained from attending. Now the British manufacturer has quite enough to carry without being burdened with sins not his own, and we think that it will be as well if something can

be done either by our electrical firms individually or through

their organised body, to remove the opinion that we are

not interested in the future of electrical trade and industry

We are not suggesting that the situation that presents itself is not one of great difficulty, but we do think that nothing is to be lost and everything is to be gained by presenting an open ear and engaging in a free and frank discussion of the problems with those who know the position so well from long and practical experience and who come to us asking for our co-operation.

On two points last week's meeting seemed to be fairly unanimous and emphatic. Belgium asks the British manufacturer to make for her what Germany has made hitherto—not simply what the British manufacturer has been in the habit of making; she also suggests that we shall "change our mind" and "change our methods," so as more hopefully to join forces with her and secure millions of pounds' worth of new business annually.

Will British firms listen to the appeal? We trust that they will do so, and if at all possible will take advantage of

the opportunity. The time to consider is now.

THERE was some interruption of busi-The Rubber ness in crude rubber over the Whitsun Position. holidays, but the market has held together very well indeed, a good portion of the improvement witnessed previously having been retained. Business has been fairly active, consumers taking supplies with a good deal of readiness, for they are running chock-a-block with Government orders for tires, and, indeed, for all sorts of material into the composition of which rubber enters. With the end of the month, however, the demand met with on the open market underwent a contraction, but this is always the case when expiring contracts are being adjusted, and a full sets in pending a fresh movement. There has been lately a fully satisfactory demand for rubber on the part of There is not the least doubt that American interests. United States consumers are feeling the force of the war demands in great volume, and this necessitates the drawing upon the supplies of raw material which are in Europe to a considerable extent.

Rather a nervous feeling has manifested itself across the Atlantic lest there be any interruption in the shipments of material from here, and a distinct desire to cover future requirements has asserted itself. Large quantities of finished goods are being produced in America for shipment to Europe, but the precarious shipping facilities available, to say nothing of the dangers to navigation, have been acting as a deterrent factor in the forwarding of material. Possibly some day effective action will be taken against the Huns still at sea, and the waters cleared for the pursuits of peaceful vessels.

The reports issued by leading plantation companies indicate a steady improvement in the management of the estates. It is quite apparent that the comparatively poor times through which the companies have been passing have induced the exercise of an economy to which, in some cases, they were utter strangers in the heyday of the boom. Costs are now running lower, but there is a considerable divergence, which, however, is to be expected, between the returns of the better managed and more favourably situated concerns, and those which were floated as "ramps" upon the public.

An interesting report has just come to hand from the Acting Controller of Labour in the Federated Malay States, according to which the most notable feature during 1914 was the reduction in the labour force. The quarterly returns furnished to the Kuala Lumpur Labour Office showed a reduction in the Chinese working forces last year of 23,000, and a falling off in the Indian total of over 20,000. The fundamental cause is said to be the various economies introduced, arising from the relatively poor prices obtained for rubber and the consequent necessity of running plantations upon business lines. There was actually a decrease in the area of 474 selected estates of 25,000 acres, while it is rather startling to find that the area of cultivated land per labourer employed increased from 2.31 acres to 2.88 acres.

The F.M.S. cultivated rubber exports for March were 3,418 tons, making a total for the first quarter of 10,303

tons, against 7,323 tons for the corresponding period of 1914, an increase of 2,978 tons. The destinations were as follows:

	March, 1915.	JanMarch.	Corresponding period, 1914.
Straits Settlements		6,619	3,858 tons.
United Kingdom	921	3,407	<b>2,8</b> 60 "

THAT the Institution of Electrical The I.E.E. and Engineers has rendered valuable services the War. to the military authorities during the war will be denied by none, and full credit should be awarded to the President, Council and staff for the really arduous tasks that they have been called upon to undertake, and have willingly performed; the amount of labour involved in these duties is not generally realised, and would astonish the members if they were fully informed regarding it. The desire of the members of Council to do everything within their power to forward the interests of their country is beyond question; yet they exhibit a strange reluctance to take any effective action in industrial matters, though these are second in importance only to the urgent requirements of the naval and military authorities.

In our issue of May 21st we quoted a paragraph from the Annual Report of the Institution, which indicated that a special Committee had been appointed by the Council 'to keep in touch with the British Electrical and Allied Manufacturers' Association in regard to the question of securing for British manufacturers the trade hitherto done by Germany and Austria-Hungary." The appointment of a Committee to deal with trade questions was an admirable step, though the terms of its appointment were more than a little singular. As shown in the Report, the representatives of the B.E.A.M.A. deprecated any action on the part of the Institution, and the Committee came to the conclusion "that no useful action on the part of the Institution appeared to be possible." The Committee "remains in being for the purpose of advising the Council"—to keep on doing nothing, presumably.

We cannot but express our regret that, even in these strenuous times, the Council displays the same timidity, the same lack of backbone, the same mental paralysis that afflicted it in times of peace whenever that vulgar word "Trade" was mentioned in its hearing. Like the hermit crab, at the approach of an unwelcome visitor, it withdraws into its borrowed shell; on this occasion it seeks the shelter of the B.E.A.M.A. But why can it not act alone?

In the leader referred to above, we welcomed the revolutionary change that had been brought about in the attitude of the Government towards the world of science—a fundamental change that will, we hope and believe, exert a profound influence upon the future of this country in all matters pertaining to industry and trade. The Government announcement followed closely upon the visit of a deputation from the Royal Society, the Chemical Society, and the Societies of Chemical Industry and Analysts. Why had the Institution of Electrical Engineers no share in that deputation? Will the Institution offer its assistance in the nomination of the Advisory Council on Industrial Research? Does it contemplate any action in the matter at all?

In referring to this matter at the annual general meeting of the Institution, the President pointed out that the Council had been criticised on the score of its inability to act in industrial matters, and remarked that the decision that nothing could be done in this instance was arrived at with the full concurrence of the B.E.A.M.A. Things must be left to solve themselves. With all respect, we submit that this was neither an explanation nor an excuse, but rather an aggravation of the fault for which the Council has been taken to task. The assistance of the B.E.A.M.A. in doing nothing was hardly necessary. The trouble is that nothing is done.

## MERCURY-VAPOUR ARC LAMPS AND CONVERTERS.

Although the mercury-vapour lamp, and its associate the mercury-vapour converter, have been widely used in this country. they have not occupied a prominent position in technical literature of late; we have, therefore, made inquiries as to recent progress in this branch of electrotechnics, and believe the results will be found of interest.

The mode of operation of the mercury-vapour are is probably well-known to the majority of our readers; unlike the Moore light, it is a true are between mercury electrodes in an exhausted container, maintained by vapour distilled or otherwise evolved from the mercury surfaces. When used for illumination, the are passes through a tube of glass or quartz; at the end containing the anode a bulb is provided, which forms a cooling chamber in which the volatilised mercury is condensed, the anode consisting either of mercury, iron, or carbon, while mercury is always used in the kathode.

The arc is usually started by tilting the tube, when the mercury flows from kathode to anode and completes the circuit; on allowing the tube to fall into its normal position, the arc is struck and maintained by the vapour column. The tube may be tilted either by hand or by a magnetic device.

A momentary cessation of the current extinguishes the lamp, and therefore it cannot operate on a single-phase A.C. circuit; this difficulty, however, is ingeniously overcome with the aid of an autotransformer with its extreme terminals connected across the supply mains and to two anodes in the lamp, while the kathode, and by suitable design it can be arranged that the current never falls to zero. With three-phase supply, the kathode, and by suitable design it can be arranged that the current never falls to zero. With three-phase supply, the kathode is connected to the neutral point and the phases to three anodes. The accompanying illustration, fig. 1, shows part of a large installation of Westinghouse Cooper-Hewitt lamps, with automatic starting, recently put in at the premises of Messrs. Stretton & Sons, Leices

Another application to which the mercury-vapour lamp has been found exceptionally well adapted is photo-printing, the

tracing paper-the light passing through the drawing-paper to the sensitised plate.

to the sensitised plate.

The frame contains 8 lamps mounted in pairs on four tilting reflectors, having a total candle-power of 8,000 c.p., and taking 3.08 kw.; it is suitable for making process plates up to 40 × 40 in., and similar frames are made up to 70 × 40 in.

The use of the lamp for sterilising water and other liquids has been fully described in our pages*; the water is passed through a chamber in which it is exposed to the rays from Cooper-Hewitt quartz mercury-vapour lamps, quartz being used in this instance to enable the ultra-violet rays, which will

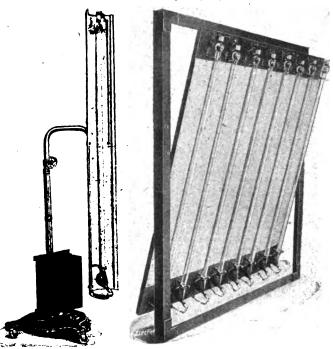

Fig. 2. Fig. 3. Mercury-Vapour Lamps for Photo-Printing.

not pass through glass, to escape, and to increase their production by running the lamp at a higher temperature, these rays being the sterilising agents.

These apparatus are largely used abroad for sterilising public purely apparatus.

These apparatus are largely used aurous for supplies.

One of the most interesting applications of the mercury-vapour arc is to the conversion of alternating to direct current, by virtue of the rectifying property already referred to. In this case the lamp is made in the form of a large bulb with a chamber at the bottom for the mercury kathode, and two or more tubes at the sides to contain the anodes—two for single-phase and three for three-phase current. The large bulb forms a condenser for the volatilised mercury. The great advantage of the mercury-vapour converter is that it has no moving parts whatever, and can be left working day and night without attendance—a very important feaever, and can be left working day and night without attendance—a very important feature. With single-phase current a transformer with a middle terminal is used as described above; the transformer may be an auto-transformer where the A.C. supply is at the right voltage, but if this is not the case, separate windings are employed, giving any desired ratio of transformation. In circuit with the kathode or the D.C. leads of the single-phase converter is an inductance coil (as in the case of the lamp) which prevents the current from falling to zero between successive half-waves.

Used as a converter, the lamp has the

the current from falling to zero between successive half-waves.

Used as a converter, the lamp has the advantage that the power dissipated in the arc is proportional not to the square of the current, but simply to the current, there being a practically constant drop of about 15 volts between the electrodes at all loads. Obviously, therefore, the higher the voltage employed the better the efficiency, the latter being at 200 volts over 92 per cent for the bulb alone; the additional losses in the transformer and sustaining coil are quite small. Also the voltage regulation at all loads is very good.

While the converter has been largely used in the United States for running D.c. arc lamps in series from an A.C. supply.

and is being tried for traction on railways, in this country it has been used mainly for supplying kinematograph arc lamps and charging batteries. Many picture theatres have been equipped with Cooper-Hewitt converters, but the tendency to employ very large currents—often exceeding 100 amperes—of

* Elec. Rev., Vol. 73, p. 516.

Fig. 1.—Sewing-Room Lighted with Mercury-Vapour Lamps.

light being rich in actinic rays, while its colour in this connection is wholly immaterial to the user. Fig. 2 shows a single Cooper-Hewitt lamp mounted on a stand which enables it to be adjusted to any desired position; this lamp is of 2,000 c.r., taking 660 watts, and is used for photographic printing. Fig. 3 shows a swinging frame fitted with similar lamps, which is used for "transfer" photo-printing from drawings on paper—not

* Elec. Rev., Vol. 73, p. 516.

late has militated against their more extended use for this purpose. It is probable, however, that future improvements in the projectors will enable smaller currents to be employed, and in any event it is, of course, possible to run several converters in parallel. For charging batteries, the converter offers exceptional advantages, owing to its self-regulating property

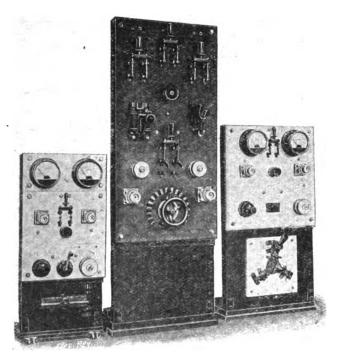

FIG. 4.—COOPER-HEWITT CONVERTER PANELS.

and the impossibility of reverse current flowing from the battery through the converter.

We illustrate in fig. 4 some converter panels recently installed by the Westinghouse Cooper-Hewitt Co., Ltd.; that on the left is one of many supplied to the Metropolitan Asylums Board for charging ignition batteries in connection with their

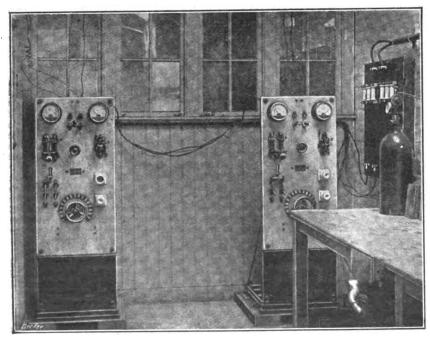

Fig. 5.—Converter Installation at the Naylor Battery Co.'s Works.

motor ambulances (the Board use these converters at all their ambulance stations). The first was supplied for this purpose six years ago. The panel shown works on a 215-volt 83-cycle supply, and gives 5 amperes D.C. at three voltages, for charging circuits of 4, 8 or 12 cells, without supplementary resistances, except the small regulating resistance seen at the foot of the panel. The panel on the right is to be supplied to the Eastern Telegraph Co., mainly for charging batteries, at 10 amperes, 150, 100 and 75 volts, from a 119-volt 75-cycle supply. A special shunt is fitted to provide a small artificial load, enabling the

converter to be kept running whilst supplying an intermittent demand for induction coils, etc. The centre panel is one built to the Post Office specifications, to give 30 amperes at 40 volts, when supplied at 200 volts, 50 cycles. The Post Office authorities have a considerable number of these converters in use for heaving a tetraining at the converter of the second of the converters in use for the property of the second of the converters in use for the property of the second of the converters in use for the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second of the second

when supplied at 200 volts, 50 cycles. The Post Office authorities have a considerable number of these converters in use for charging batteries in telephone exchanges, and it is especially interesting to note that the converter has to be suitable not only for charging the stand-by battery, but also to charge a battery that is actually connected to the exchange switchboard, without affecting conversations. Further, it must be capable of supplying current direct to the switchboard in the event of both batteries being put out of use.

By the courtesy of the Naylor Battery Co., we have been enabled to inspect and photograph a pair of panels which they have employed for the past twelve months for forming and charging their accumulators at their works in Balham. An earlier set was installed in 1912, and though at first some difficulties were experienced, these were successfully overcome—as will be gathered from the fact that additional sets were installed. These supply 80 amperes D.C. at 160 to 200 volts, and are fed from an A.C. supply at 205 volts, 50 cycles. Regulation is effected by tappings on the transformer primary. The fact that the apparatus can be left at work for days together without supervision is particularly advantageous in this connection, and the long life of the bulbs—some of which have run for over 4,000 hours—is in their favour. By means of a time switch, the charging process can be stopped at any time desired, and the properties of the apparatus render it particularly suitable for use in garages where electric vehicles are charged—a purpose to which the Naylor Battery Company's installation has been regularly applied, the company having an electric delivery van of their own. In view of the increasing use of electric vehicles, the matter is worthy of the attention of garage owners in areas supplied only with alternating current.

## ANGLO-BELGIAN ELECTRICAL CO-OPERA-TION IN BELGIUM.

In response to an invitation issued "under the auspices of the London Chamber of Commerce and the Belgian Committee for Trade with the Allies," we attended a lecture delivered at Cannon Street Hotel, E.C., on Thursday afternoon last week, the objects of which were announced as follows:

"To bring tegrather the British electrical

noon last week, the objects of which were announced as follows:—

"To bring together the British electrical supplies manufacturer, and the Belgian buyers, for the mutual consideration of the practical ways and means to establish business relations, immediately the invaded territories are free.

"1. How can the British supplies manufacturer secure the Continental electrical trade, hitherto in the hands of enemy countries?

"2. The desirability of the constitution of a U.B.E. (Union of Belgian Electricians) to act as intermediary between the British manufacturer and the Continental consumer.

"3. The selling and organising policy necessary to achieve this object, on a cooperative basis."

The chair was taken by Mr. A. H. Lawrence, Vice-President of the British Chamber of Commerce in Belgium, who, in opening the proceedings, referred to the opportunity that existed for England to capture the very large business that had been done between Belgium and Germany. The trade was there for the Englishman if he was prepared to make some little effort and sacrifice, but such effort and sacrifice would be well repaid. On behalf of the London Chamber, the speaker said that they would be pleased, through their Electrical Section, to give every assistance to any gentleman who might require it in these matters. The Chairman trusted that the British Chamber in Belgium would be of some use to them and that when they were once again established in Brussels, the Belgian Committee of Trade would be in existence, and that hand in hand with that committee they would be able to drive out the commercial German from Belgium.

The proceedings which followed were chiefly conducted in Erench. The lecturer M. R. Steylards, an electrical engineer

The proceedings which followed were chiefly conducted in French. The lecturer, M. R. Steylars, an electrical engineer who had been prominently connected with a number of Belgian concerns prior to the war, read his lecture, and for part of the time it was read in sections in English also by Mr. Barwick. About half-way through, however, owing to the

meeting consisting almost entirely of Belgians—about thirty were present—the English translation was dispensed with. We refer on another page to what we believe to be one of the reasons for the un-English character of the audience.

M. STEYLARRS first expressed thanks to the London Chamber of Commerce and the Belgian Committee of Trade with the Allies, for their efforts in convening the meeting. He was

we refer on another page to what we believe to be one of the reasons for the un-English character of the andience.

M. STEYLARES first expressed thanks to the London Chamber of Commerce and the Belgian Committee of Trade with the Allies, for their efforts in convening the meeting. He was approached by the Belgian Committee to develop through the medium of a meeting such as that a definite and positive policy that could be operated immediately Belgium and Northern France were free. The speaker considered that an open discussion was preferable for the mutual exchange of ideas, to an individual exposition, hence the calling together of the manufacturers of British electrical supplies and Belgian buyers to study the most appropriate means of realising the object expressed in the invitation. Addressing himself to Belgians present, he regretted that at the exhibition along the lines of the Leipzig Fair, recently held at Islington, for toys and cheap ware, space could not be allocated for the exhibiting of the productions of British manufacturers who would take part in the rebuilding of Belgium, and whilst appreciating the spirit that prompted the exhibition, suggested that, as Belgians, they would have been interested in seeing those products which would enter into the industrial rebuilding of their country. It was admitted that the exhibition was for the development of British trade at home and in the Colonies, but the British manufacturer could not successfully confine his efforts to the British Empire alone. If he was to beat German competition, he must find a world market. The production of cheap articles necessitated an enormous demand, which could not be responded to by the British Empire alone. There was, however, a scheme under consideration to organise an exhibition of the products in which they were interested, and steps were being taken by various committees to obtain a venue for this purpose. When these arrangements were completed an announcement would be made in due course. These introductory remarks wer

ment. For present purposes, it was necessary to make a careful analysis of the conditions as they existed before the war.

The greater part of the electrical supplies was either directly or indirectly controlled by Germans. In Belgium there was first, the Belgian Union Co., Ltd. (A.E.G.), in reality a branch of the renowned Allgemeine Elektricitäts Gesellschaft, Chaussée de Charleroi in Brussels, similar to the Parisian concern, the Société Francaise d'Electricité (A.E.G.), 72, Rue d'Amsterdam. As a matter of fact, these companies were Belgian and French in name only. The Belgian company had (if the speaker remembered rightly) a capital of one million francs, and the French company a capital of two million francs. The object of the company expressed in the articles of association was "for the exploitation of workshops for the construction of electrical supplies generally, and particularly the production of the Allgemeine Elektricitäts Gesellschaft, Berlin Co., Ltd., with a capital of seventy million francs. The name of the directors of the so-called French company would indicate their nationality: Messrs. M. Mamroth, Ross, and Koch, together with Messrs. Thurnauw and Burrell, the last two gentlemen being also on the board of the French company for exploiting the Thomson-Houston patents. Due to these directors being associated with both companies, it need only be said that the two interests were not allowed to clash. There was also in Belgium the Siemens-Schuckert Co. and the Siemens & Halske Co. (Rue Thérésienne in Brussels, and Rue de Dunkerque 52 in Paris). The articles of association of these companies stated "that their object was for the sale in Belgium and France of the productions of the two German companies, Siemens & Halske and Siemens-Schuckertwerke Aktien Gesellschaft mit Beschränkter Haftung. Further, the French Siemens' company acquired a large monetary interest in the French concerns of La Companies, with head offices at 19, Rue Louis le Grand, in Paris. This company was the former French concern

La Société Industrielle d'Energie Electrique, 30, Rue Caumartin, Paris. Directors: Messrs. Cahen, Petri, Simler.
 La Société d'Electricité de Varsovie. Directors: Messrs.

Salomon and Cahen.

3. La Société Continentale de Traction et d'Eclairage. Directors : Messrs. Cahen, Petri, Rosenbaum.

4. La Société des Applications de l'Electricité à la Traction. Directors : Messrs. Von Chauvin, et Von Siemens Natalis.

4. La Société des Applications de l'Electricité à la Traction. Directors: Messrs. Von Chauvin, et Von Siemens Natalis.

The aggregate capital of these four companies was 32 million francs in shares, and ten million francs in debentures.

In Belgium there was also the Electric Dynamo Co., Lahmeyer, recently acquired by the A.E.G. Against these big German corporations (which, the speaker incidentally remarked, he regretted were partly financed by French and Belgian capital) there existed the Belgan concerns—the Ateliers de Construction de Charleroi, under the financial control of the Belgian group Empain; the Pieper Co., in Liége, for the construction of electric motors; and the Ateliers des Cables de Seneffe, for wire and cables. In France there was the Electricité, the Nancy Co., and Electromecanique Co., producing high standard dynamos, The British trade was represented by the Westinghouse Co., the British Thomson-Houston Co., and the Tudor Accumulator Co., and, prior to the war, the General Electric Co., for supplies. For these concerns, however, the competitive fight was unequal against the financially strong German trusts. The latter, due to their resources, were able invariably to secure the business, being in a position to cut their profits to a minimum. They were able to engage in aggressive selling policies, and, in certain instances, their productions were of a superior quality, particularly the German Siemens productions. This company was favoured with many French and Belgian Government contracts. In France, La Compagnie d'Electricité de Creil (controlled by the German Siemens Co., as stated) were fortunate enough to number among their clientèle the orders for searchlights for the fortifications of Bizerte, the electrical equipment for the departmental railways in the Province of Haute Vienne, and the electrical railways of the Bois de Boulogne. In Belgium it was the same; Government contracts were secured by these firms, and, in view of the circumstances, it was interesting to remember the harbour of

same remarks applied to the electrical equipment of the forts around Antwerp.

In the wholesale business the same policy was apparent. A concern in Brussels, with a wide Continental reputation, Messrs. Poock & Hermann, possessed perhaps the most complete stock of electrical supplies on the Continent, comprising some 5,000 specialities. Belgian electricians would remember the principals of this company visiting Belgium some ten years ago in the capacity of ordinary salesmen submitting samples. A few years later, backed by the financial support of a number of manufacturers of German electrical supplies on a co-operative basis, they acquired a unique standing in the Belgian market, securing a substantial portion of the trade. Catalogues of an expensive and elaborate nature were freely distributed by this house, and, when one considered the modest nature of their operations in the initial stages, it was obvious that the success attending their activities was only possible with the support of the manufacturers they represented. There were, of course, Belgian wholesale houses, but they were unable to compete with the German wholesaler. These concerns endeavoured to sell outside the Trust, but high individual selling cost, and the question of individual credit, initigated against them to such an extent that their success was limited.

Immediately before the war, the A.E.G. Co. were respon-

mitigated against them to such an extent that their success was limited.

Immediately before the war, the A.E.G. Co. were responsible for the last phase of their carefully and skilfully prepared scheme, and approached the consumer direct, thereby eliminating the intermediaries' profit. This company submitted prices for the execution of electrical installations not only in large enterprises, but also those of minor import.

Naturally (as was always the case when the middleman's position was endangered) the retailer resented what he considered was a violation of his rights; therefore, when this sidered was a violation of his rights; therefore, when this sidered was strongly expressed, the A.E.G. Co. concessentment was strongly expressed, the A.E.G. Co. condescended to withdraw their quotation in favour of a Belgian concern, on the mutual understanding that in the event of the particular concern securing the business, the order for the material necessary for the execution of the installation be placed with the A.E.G. Co. They might, therefore, assume that 95 per cent. of the Electrical Supplies business was dominated and controlled by German manufacturers. They secured the contracts of the public services and private businesses. How could the Belgian workshops (however soundly established) profitably meet this competition? They even feared to try, because they realised that the object of this competition was that inseparable from trust and monopolies, namely, to crush every suggestion of competition by selling almost at, and sometimes below cost, and when the purpose competition was that inseparable from trust and monopolies, namely, to crush every suggestion of competition by selling almost at, and sometimes below cost, and when the purpose was achieved, to inflate prices, and thereby redeem the small profits of the past, and create large profits for the future.

The position was identical in the telephone and electrical lamps part of the industry. In Belgium the Telephone Co. La Societé de Téléphonie Privée recently had to contend with aggressive competition from the Berliner Co., L' Otomat, who, by skilful and persistent publicity, invaded the public services,

Banks and Government Offices. Paris had also to contend with this competition where the German company competed against the French company under a French name, flooding the market the French company under a French name, flooding the market with German raw material and telephone apparatus, employing German labour, and gaining entry into the administrations of the French Government, the military circle of the Avenue de l'Opera in Paris, 'the town councils of the 9th and 10th arrondissement in Paris, the town councils of Clichy, Dunkirk, and Maubeuge, and obtained the concession of the telephone installation of the International Exhibition in Lyons. It was not surprising that this free licence of entry had been utilised to advantage by German espionage agents.

Relative to the electrical lamps sold in Belgium and France, it was only necessary to name the concerns and trade-marks to determine their origin. As a matter of fact, all the German

to was only necessary to name the concerns and trade-marks to determine their origin. As a matter of fact, all the German houses selling these lamps had their own offices in Brussels. They were the Osram Lamps (Auer Gasglühlicht A.G.), A.E.G. Lamp (A.E.G. Aktien Gesellschaft), Pope Lamp (German Pope A.G.), Wotan Lamp (German Siemens). Against this combination the only competing lamps were the Philips and Tantal Lamp, of Dutch manufacture, and the Z Lamp, of Belgian manufacture.

Lamp, of Dutch manufacture, and the Z Lamp, of Belgian manufacture.

Appealing to his own countrymen, the speaker queried them as to whether they were prepared to continue to be dominated by the German manufacturers, and suggested that the spirit animating all Belgians was the desire to recover their economical independence, in the same way as they were reconquering their territorial independence. The problem, however, was not a simple one, and presented many difficulties. It would necessitate the co-operation of all the interests engaged—the co-operation of the British manufacturers, the co-operation of the Belgian consumers. In a legitimate manner it was possible to commence where the German manufacturer left off, to ascertain by analysis the causes of his success and development, and to extract the best from his operations and development, and to extract the best from his operations and apply them to the scheme of reconstruction. But he must be kept out, and the Belgian Parliament must, and would, create

Examining the causes of the development of the German industry generally, and not only confined to Belgium and France, they arrived at the following conclusions as to

essentials:

1. Large stocks on spot, and keen competitive prices resultant of an actual knowledge of productive costs.

2. An elastic credit policy, together with an efficiently trained celling organisation, and the operation of intensive and extensive selling policies.

3. The extensive publicity to focus attention upon German productions.

productions.

Relative to the question of stocks, the Belgian and French retailer or contractor had given, and would continue to give, the retailer or contractor had given, and would continue to give, the preference to the supplier who was in a position to execute his (the retailer's) requirements from stock, in large or small quantities, thereby avoiding the investment of his capital in stock. British concerns established in Brussels before the war could substantiate this statement. Purchasers would not hold stocks, and the difficulty of importing material from countries where the language, currency, and measures were different would be appreciated. The Continental electricians worked practically always with the capital of the wholesaler. The ultimate purchaser desired to see samples before purchase, and refused to buy on catalogue. The prevailing conflict had demonstrated that psychologically the German was prone to err, but he appreciated this Continental commercial weakness, and adapted his methods accordingly, with advantage to himself.

The British manufacturer, on the other hand, appeared to be obsessed with the selling power of his catalogue, and con-

The British manufacturer, on the other hand, appeared to be cosessed with the selling power of his catalogue, and considered that through this medium he could create sales and induce customers to carry stocks. Frankly, he was wrong, and the possibility of his securing business along these lines was not only remote but almost impossible. The Continental purchaser sent an employé to the wholesaler for his daily or weekly needs, and often took the liberty of returning any surplus he was unable to utilise.

The policy of cut prices by the German producer might, from the point of view of the British manufacturer, superficially appear to enhance the difficulty of taking advantage of this new market, but a closer investigation would satisfy him, that by a system of specialisation it was not only possible to produce the goods in which the Germans specialised, but to produce them at a profit.

to produce the goods in which the Germans specialised, but to produce them at a profit.

Now was the opportune moment for the British manufacturer to take advantage of the forced residence in this country of the Belgian electrical specialists, to collaborate with them as to the potential requirements, and to carefully analyse the question of price and productive cost, and by this process to arrive at such an understanding as to establish a sound and estificatory foundation.

satisfactory foundation.

Concerning the question of credit. Not only had the German manufacturers co-operated in order to maintain stocks, but man manufacturers co-operated in order to maintain stocks, but they had skilfully organised the credit side. Practically the whole German commercial policy was based on extensive credit, made possible by the German banking system, which had nade possible German industrial development of the markets of the world. In fact, immediately before the war, it was not unusual for credit to be extended by bankers to the German manufacturer over a period of one or two years, particularly in fancy articles. The complicated process of this credit system might be interesting to consider. The basis was the repeated renewal of bills on the customers in the markets of London and Paris by the German banker, the manufacturers discounting the bills on the customer in the same way with their bankers, with the cash from the operation in the London or Paris market.

Paris market.

A common process was as follows:—When a manufacturer's business reached a volume where his own financial resources would not allow the execution of same, he went to his bankers. who satisfied themselves as to the financial status both of manufacturer and his customers, and entered into an arrangement with the manufacturer as follows:—They, the bankers, agreed to advance 15 per cent. to commence operations, 25 per cent. on the completion of the manufacture of the goods, and 25 per cent. against bill of lading, the outstanding 35 per cent., which represented gross profit, remaining in the bank as a nucleus fund for the next operation on similar lines. Backed by such a financial system it was not surprising that the German manufacturer by the might of his credit monopolised the Belgian market.

In regard to Selling Methods and Publicity, the selling representative was carefully selected and trained, was paid a substantial remuneration which gave him a good social position and made an impression on the customer. If it was not possible for financial reasons to engage such a salesman, the manufacturer would co-operate with other manufacturers producing non-competitive products appealing to the same customers, and

and made an impression on the customer. In twas not possible for financial reasons to engage such a salesman, the manufacturer would co-operate with other manufacturers producing non-competitive products appealing to the same customers, and the expenses would be shared. The German manufacturer was not a successful pioneer, but essentially a copyist. If he desired to exploit a new market he instructed his most progressive salesman to go to this new market and procure samples of the goods commanding the best sale, with prices and discounts allowed by the manufacturer. He then analysed the proposition to the minutest detail, eliminated any feature that he considered superfluous, and based his productive costs on an enormous output. A few weeks later the salesman was back again offering a copy of the article in question, at lower prices and on better credit terms, so that he was able to secure large orders and contracts immediately. It was this process of elimination that had been responsible for the stigma associated with German manufactures on the Continent, viz., "German rubbish."

The indirect system was more insidious, and was a system of commercial espionage. A German clerk subsidised by a German manufacturer entered a Belgian office or factory, under the pretence of learning the language at a very low salary, and dispatched to his employers the names of potential customers, and kept them furnished with data and information that could be used to advantage. Addressing his Belgian friends, the speaker emphasised the dire necessity to free themselves from the corrupting and pernicious influence of the German domination. Direct and indirect trade with Germany must be met and defeated by aggressive policies, and he called for the abolition of German companies trading under Belgian names.

It was clear that immediately the invaded territories were free and capable of reconstruction, the German supply of cables, tubes, dynamos, wire, materials for high and low tension, supplies for installation, fittings, etc., woul

free and capable of reconstruction, the German supply of cables, tubes, dynamos, wire, materials for high and low tension, supplies for installation, fittings, etc., would not be available, even assuming the Belgian electrician was prepared to purchase from this source. Practically everything would have to be replaced. In Belgian factories cables were being appropriated by the Germans for the utilisation of the copper for producing shells. The electrical conduit systems central stations and sub-stations were totally or partly destroyed, and as had already been suggested, when the invaded towns were reoccupied the destruction would be complete. The problem therefore resolved itself into the question, "Where are these supplies to come from?"

The United Kingdom, and to a certain extent France, produced high standard electrical supplies, and nothing seemed easier than to transfer the business to these countries, but the difficulties were more real than apparent. In the first place the supplies used hitherto were of a different character and nature to those supplied by the United Kingdom and France. In fact it would be necessary, were English supplies sent as used in England, to educate the workmen along totally different lines to what they were accustomed to, and therefore it was obvious that it would be necessary to reduce this difficulty to a minimum. The customer was conversant with his needs and expected to have them satisfied, and would not tolerate having to alter his methods and change conditions to what the manufacturer considered his needs should be. tions to what the manufacturer considered his needs should

The object, therefore, of the Belgian electricians should be to induce the British manufacturer to produce such goods as would meet his actual requirements, habits and working

methods.

They must not be deceived into the belief that the resource-They must not be deceived into the belief that the resource-ful German manufacturer would lose the market without making an effort to retain it. If it was possible to get supplies through to a country with which he was at war, the ways and means would be found with less difficulty after the war to retain this business. The speaker was of the opinion that his countrymen would have to fight hard to be masters in their own house.

It was necessary that the Belgian trade should suffer as

It was necessary that the Belgian trade should suffer as little as possible as a result of the change involved. This particularly referred to the small retailer who would require all the assistance he could get in order to restore the normal current of industrial activity, interrupted by this crisis for which there was no precedent in the economic history of any

nation in the world. The British manufacturer, however, could not be expected to change entirely his commercial methods for the express benefit of Belgium. The primary consideration of the express benefit of Belgium. sideration of the British manufacturer before exploiting a new field was that of the safety of his credit. He desired to make good his operations, and if he was satisfied that the risks were too great he preferred to leave the matter alone. The question expressed frankly was, "The Belgian electrician desires credit, and the British manufacturer wants the business and the money." How can these interests be reconciled?

The speaker had occasion to discuss this matter with British results a proper with British manufacturer.

The speaker had occasion to discuss this matter with Bri-The speaker had occasion to discuss this matter with British manufacturers in his initial efforts to interest them in the Continental markets. His impression was that whilst they were prepared to stock their goods on the Continent, they would only do so after a demand had been created for them. He suggested that this would be willing the ends without the means, but appreciated their reluctance due to the fact that the exploitation of a new market necessitated additional capital. The system of banking prevailing in the United Kingdom did not encourage the manufacturer along these lines, and he was therefore abandoned to turer along these lines, and he was therefore abandoned to his own financial resources, and must develop his business slowly. It was necessary to adopt financial measures for the slowly. It was necessary to adopt mancial measures for the constitution of a corporation to act as a clearing house to transmit orders to the Allies, the development of Belgian national manufactures taking place during the interim.

The proposal was, therefore, that an organisation be created to act as a connecting link with the manufacturer and the purchaser. This organisation would appeal to the wholesale trade and replace the Comman organisation operating before

trade, and replace the German organisation operating before the war. The speaker's suggestion was the creation of a corporation under the name of "The Union of Belgian Elec-tricians" (U.B.E.), displacing the other Union, which was Belgian in name only.

The U.B.E. must be a strong representative association of Belgian electricians with an initial capital of not less than one million francs (£40,000). Its object would be to represent on the Continent British and French manufacturers of electrical supplies, and, when conditions permitted, to encourage the Belgian electrical supplies manufacturer.

Such a corporation patronised, solidly backed, and scientifi-cally organised in regard to the selling policy, would obtain better credit terms from the manufacturers than those ex-

better credit terms from the manufacturers than those extended to any individual outside its scope.

The manufacturer would be in a position to make good his credit immediately. He might give credit as occasion demanded—30, 60, or 90 days, or as the case might be—and he would be in a position to discount his bill on this corporation with his bankers. It would encourage him to place stocks at the disposal of the Corporation and to draw on the corporation for such stock at 90 days, six months, or nine months.

Further, the corporation being on the spot, would have a better knowledge of the financial status of each customer and, moreover, would of necessity be more conversant with the

moreover, would of necessity be more conversant with the prevailing conditions.

It would be part of the task of the U.B.E. to encourage

Belgian industry by placing their orders with the concerns specialising in a certain phase of electrical supplies and who were hitherto exporting their productions, such as the dynamos manufactured by Pieper Co., Liege, already referred to.

In short, the U.B.E. must be the financial crutch whose chieft was to expire the Belgian latest when the species of the production of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the context of the c

In short, the U.B.E. must be the financial crutch whose object was to assist the Belgian electrical industry to rise above its industrial upheaval, with the assistance of foreign suppliers, who would in turn benefit by their share in the enormous demand for their goods. All specialities handled by the corporation would be sold under the manufacturers' name and trade marks, and every effort would be made to place the business with those manufacturers interested in the corporation, thus creating a goodwill for the manufacturery goods. Was this proposal worthy of consideration by the British manufacturer? The time for talking was past, the time for practical effort was now! The opportunity must be accepted NOW, otherwise Belgium would be reluctantly compelled to re-open relations, because of urgency, with the nation which had prostituted all that she held most dear. A peroration of rhetoric in regard to the national side of this A peroration of rhetoric in regard to the national side of this people would not be acceptable to business men met together for a business purpose, but would it not be repugnant to the finest feelings of this nation to be obliged to turn to her enemies for the material to rebuild her battered cities, her demolished and ruined towns and villages, made such by the ravages of these enemies? The prospect of Germany making profit at the expense of the brokenness of Belgium would be an inconceivable irony. an inconceivable irony.

Belgian electrical experts in this country waiting for their country to be freed—might be here a few weeks, or perhaps a few months. This period should be utilised by these gentlemen and British manufacturers for an interchange of ideas, because the moment the invaded territories were free the refugee population in this country and France would rush

retugee population in this country and France would rush back to their homes and would commence themselves to rebuild their country out of the ashes. The speaker, in closing emphasised that which had punctuated the whole of his discourse—"THE TIME TO ACT IS NOW!"

Mr. TOWNSEND, who said he represented the selling end. addressed the meeting at some length. He was disappointed to see so few British manufacturers present, and dwelt generally upon such matters as the study of productive costs, the importance of the selling end being right, the necessity for

standardisation of specialities, the importance of co-operation and intensive advertising. "Combination must be met by and intensive advertising. "Combination must be met by combination, syndicate by syndicate, publicity by publicity." Suggestions having been made that the absence of British was due to appathy.

suggestions having been made that the absence of British electrical manufacturers from the meeting was due to apathy on their part, Mr. Albert Bridge (Electrical Review) asked those present to suspend their judgment on that matter until they knew whether British electrical manufacturers were aware of the proceedings, whether they had been approached through their organisations, and whether such notices as were issued to the Press were issued too late for the matter to be announced in any way before the meeting actually took place. He thought Belgian gentlemen present could feel assured He thought Belgian gentlemen present could feel assured that British electrical men were not indifferent or apathetic in regard to the future position of electrical affairs in Belgium. It had been the ELECTRICAL REVIEW's privilege to welcome to this country and assist many electrical engineers who had come here after the German onrush, and he believed that the hearts of all British electrical men were with them; let them not too, hastily hold them guilty of apathy. M. Steylaer's excellent address contained much valuable material, but it told again the cause crow as had been heard for many but it told again the same story as had been heard for many years past of the methods adopted by German interests in all parts of the world for undermining others' trade. He believed that British electrical manufacturers were with those present in their desire and determination to rid Belgium for the future of the German electrical domination,

As the result of suggestions from the meeting, it was proposed that another meeting be held on a date to be fully and well announced so that British electrical firms should be afforded a better opportunity of discussing the subject, M. Steylaer's paper forming the basis for such discussion.

### GERMAN BUSINESS METHODS.

In the course of his address to the Sales Managers' Association on "German Business Methods as seen by a Canadian Resident in Berlin," Mr. J. H. Vickery said he was not qualified to refer to those business methods in detail, but he spoke as a lawyer who came into contact with a great many kinds of business in Germany. He was first struck by the "great wedding," "the nuptual union between theory and practice, the fructification of science by its application to commerce, to industry," and to the welfare of the community generally. Mankind did not exist for science, but science existed for mankind. The Germans had been more practical then we in the application of science to increase the store of tical than we in the application of science to increase the store of human happiness (Who said Lusitania? Who said Zeppelin?). Some 21 great German Universities had taken a leading part in Some 21 great German Universities had taken a leading part in the study of applied science—that was a difference between the German and British University. Oxford and Cambridge were magnificent institutions, but they were not perfect. An American professor in Berlin had said that the German University was not an institution of education, but one of instruction, to instruct the mind, to give it a store of knowledge, to fit it out with all the details which it required to enter into the practical work of commerce and industry. Those who left the British Universities might not have the mind stuffed so very full of the facts of human knowledge, but they possessed a greater ripeness of character, and a greater knowledge sessed a greater ripeness of character, and a greater knowledge of the mutual psychology of the people. The American professor of the mutual psychology of the people. The American professor thought that the American University combined the better features of both systems; certainly on its practical side the Cornell University was admirably fitted to prepare a young man to enter his life's work. University education had come to be regarded in Germany as a sine quâ nun for almost every man who made any pretension to "culture." There were 21 such institutions of learning with a total student membership of pressly 70,000 and learning, with a total student membership of nearly 70,000, and there were 11 technical high schools with something like 17,000 students. There were 400 other institutions of various kinds for the study of almost everything that entered into human life, and there were the so-called continuation schools for enabling the student, when he went into the workshop, to keep up the habit of being a student, in his spare hours. Scientific training was the one great thing upon which they had expended their best efforts—in the eyes of an analysis of the property than the property that the property in the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the observer there was nothing comparable to it in the American whole world.

The speaker next referred to the subject of selling, marketing, and distributing goods, and said that the power of the people to develop their natural products and to create artificial products had been supported by a wonderful linking up of the scientific institutions and of the administrative, political, and even diplomatic institutions of the Fatherland. That was one reason why their success had been so prominent. There had been no working at cross purposes; there had been team work. In regard to linguistic aids to marketing and selling, the ability to command one or more foreign languages constituted an aid of undoubted value. The commercial value of foreign languages had long been recognised by Germany; facility of acquiring and speaking them had constituted a most valuable factor in the development of German commerce and industry. We must spend less time studying The speaker next referred to the subject of selling, marketing, German commerce and industry. We must spend less time studying ancient languages and devote more to a better understanding of the languages spoken by the Allies. The influence of law upon commerce and industry was next referred to by Mr. Vickery. He gave a few illustrative examples to show the process of linking up law with actual business. Accident insurance was mentioned, also

The question of internal transport was one that had received close and thorough consideration in Germany from many points of view. The Government owned and controlled the railway system, and there was a truly wonderful system of inland waterways linking up the German rivers and harbours. reaching State control of the railways had been exercised in the interests of business and of the industrial public, and therefore by necessary implications in the interests of the State itself. It had been found possible to combine rigid economy of administration with high efficiency of service. The canal system afforded a remarkably cheap transport for allow freights, and at all times of the year except mid-winter long lines of man, horse and machinethe year except mid-winter long lines of man, horse and machine-propelled barges might be seen gliding slowly along the canals of the Fatherland, laden with goods; the main thing was that the freight was remarkably cheap. On the influence of political policy on business, the speaker raid that the chief business of the statesman and the chief business of the diplomat was to order commerce and industry in their widest sense as the foundation of human existence from day to day. According to the German view, commerce, industry and they reaccond presents here must and payed of a large militant other peaceful pursuits became part and parcel of a huge militant system founded on power, brutal, egotistic and devoid of that altruism of a people who recognised and welcomed the rights and claims of other nations. According to this view there was no room in this game of life which men and nations play, for anything like friendly competition or for generous rivalry, such, for instance as had been found compatible with the hundred years of thing like friendly competition or for generous rivalry, such, for instance, as had been found compatible with the hundred years of peace as touching the relations of the United States and Great Britain. According to the German ides, all was war! war! war! Peace was merely another state of war—it was warfare in abeyance until the rivalries happily ripened into the hostilities of the battlefield, and war became the noble consummation of the conflict for which the so-called peaceful pursuits had laid the foundation. This was the process which had been going on in the mind of militant Germany for a number of years. This fact explained of militant Germany for a number of years. This fact explained the remarkable growth of the Social Democratic party in Germany, which, although everything had been done to make it happy and contented, as, for instance, accident insurance, old age pensions, sick insurance, education, and the greatest possible freedom in personal habits. habits, was, nevertheless, discontented, did not like the Kaiser, did not like his ministers, and did not like the whole business. When the war was over a good many things were going to be discussed in the Fatherland, and he thought that the Social Democrats would play a leading part in that discussion. We, to-day, were fighting the same fight as the Social Democrats had them social properties of the same fight as the Social Democratic had them. selves been fighting for years, the fight for constitutional responsible Government.

Mr. Vickery put in a plea for a reconciliation in this country between Free Trade and Protection. The matter was acquiring a between Free Trade and Protection. The matter was acquiring a new meaning in these days, that was his excuse for touching it. The gradual evolution of Greater Britain into something which might be called a federation must, in the course of the years, bring with it as an economic and historical necessity something like an extension of the principles of Free Trade in the shape of inter-Imperial trade. The necessity for the better linking up of the functions of Greaternest and of business and deposition inter-Imperial trade. The necessity for the better linking up of all the functions of Government and of business and education -the mobilisation of our resources—was Mr. Vickery's closing

## WAR ITEMS.

War Exhibition.—In view of our incalculable indebtedness to the gallant Belgian nation, a War Exhibition has been organised to assist the funds of the Belgian Red Cross Anglo-Belgian Committee. It is designed to present in an interesting and instructive mittee. It is designed to present in an interesting and instructive manner an idea of the extent to which science and industry arebeing utilised in every branch of the present gigantic struggle. There will be a magnificent 13,700 sq. ft. mural panoramic representation of Belgium. This portrays amongst other scenes the beauties of Brussels. Antwerp and its magnificent port, Bruges (the Venice of the North) with its many bridges. Ghent, Ostend and the Coast, Liege, Namur and the Valley of the Meuse, including the ill-fated Dinant, Louvain, Malines, Ypres, and Viré, the first town to fall temporarily under the iron heel of the barbaric Hun. Season tickets are being issued at £1 ls. each, carrying the privilege of the holder admitting a different friend at each visit if desired. It is hoped that a large application by the public who desire to help will be made for these season tickets, and it may be mentioned that they will be available on all the National and mentioned that they will be available on all the National and International Days which are being arranged throughout the season. The Exhibition comprises seven sections, No 4. of which will relate to science and industry as applied to war, including the latest scientific instruments used in connection with war. The the latest scientific instruments used in connection with war. The Prince's Skating Club, Knightsbridge, S.W., has been selected as the most suitable place in which to hold the Exhibition. Offers of interesting War Trophies as loan exhibits, or assistance of every kind towards making the Exhibition the great success it deserves to be on account of its object, will be welcomed by the Hon. Organising Secretary, War Exhibition, London Chamber of Commerce, 97, Cannon Street, London. E.C.

Reard of Trade Inquiries.—The R of T. Commercial Intelliging

Board of Trade Inquiries.—The B. of T. Commercial Intelligence Branch has issued list No. 22, to date May 22nd, of inquiries received by it for sources of supply of goods.

Commercial Travelling after the War.—At the annual conference of the United Kingdom Commercial Travellers Association held in Manchester last week, Sir William Mather, of the firm of Messrs, Mather & Platt, Ltd., was elected president. He

was unable to be present, but in the course of a letter which he wrote to the conference, Sir William said that after the war the education necessary for an efficient commercial traveller must be largely developed on the lines of cultivating the scientific and largely developed on the lines of cultivating the scientific and technical, as well as the literary branches of knowledge. A higher general intelligence and all-round capacity would be needed to improve Great Britain's position among the progressive nations of the world. Though they must at any cost crush the vain-glorious and infamous means which the German Government had adopted with the object of enabling Germany to become the autocrat of the world, they could not, nor did they desire to, prevent the people of that country from reaping in the future the results of their indomitable perseverance and extreme efficiency in every department of peaceful activity which their educational methods had created. We could not conquer to subjection the people of Germany as competitors in trade and industry, but we could command our due share of the fruits of knowledge and enterprise throughout the world, so that we might continually enjoy, if we developed world, so that we might continually enjoy, if we developed continuously the high intelligence necessary, a pre-eminent place in the competition of intellect that would follow this world war. Touching on the cultivation of closer relationship with Russia, Sir William said that the study of the Russian and French languages would amply repay the commercial traveller.

Would amply repay the commercial traveller.

Glasgow Tramway Recruiting.—Glasgow tramway officials are meeting with much success in recruiting for the various battalions raised by the T.C. Last week 400 men were enlisted for the 15th, 16th, and 18th Highland Light Infantry, the Royal Engineers and the Royal Field Artillery. The infantry corps are located at Gailes Camp and the artillery and engineers at Ayr.

Depôt companies are being formed for the 15th and 16th H.L.I., the main hodies having gone to the South of England to complete the main bodies having gone to the South of England to complete training.

Anti-German Outbursts in South Africa.-Our Cape Town orrespondent writes:—"As a protest against the sinking of the /usitania, the employes of the Victoria Falls Power Co., at Brakpan, sent an ultimatum to the management stating that unless all Germans, naturalised or unnaturalised, were dismissed, they would

In the rioting at Johannesburg the offices of Siemens, Ltd., and of the A.E.G. Co. have been destroyed by fire. In Cape Town the hardware and electrical stores of K ich & Dixie were set on fire and all windows smashed; a considerable amount of stock was also damaged. Some damage was also done to the premises of Leemans Bros., electrical contractors, in mistake, the firm being H .llanders and not German."

British Industries Fair, 1916.—We are informed that in view of representations made by the exhibitors and buyers at the British Industries Fair, which was recently held in the Boyal Agricultural Hall, the Board of Trade have decided to hold another Fair in London early next year.

Personal.—Mr. Arthur B. Crump, late of the staff of Mesare. Willams & Robinson, Ltd., of Rugby, has received a commission as lieu enant in the South African Heavy Artillery, and is on service in German South-West Africa. When at Rugby he was in the Howitzer Battery.

Mr. T. A. Nacmick of Mesaketers.

Mr. T. A. Nuawick, of Manchester, has received a cable from Mudros, from his son, Midshipman A. C. Nuawick, late of H.M.S. Triumph, stating that he is safe and well. He has also received a

telegram from the Admiralty to the same effect.

Mr. Haydn Harrison has been appointed lieutenant in the R.N.V.R., attached to H M.S. Vernon for special work in connection with the Admiralty. This will, of course, necessitate his absence from town, but his business at 11, Victoria Street, will be carried

on as usual.

The following appear in the Lordon Gazette among the names of aliens to whom certificates of naturalisation have been granted

during May, 1915:—
Myhre, Einar (Denmark), electrical engineer, residing at Blackheath

Parshall, Horace Field (U.S.A.), consulting engineer, Vasile (Vessel), George (Roumania), electrician, residing at

Vasile (Vessel), George (Roumania), electrician, residing at Ferndale, Glam.

Mr. P. Grice, who has just been gazetted Second Lieutenaut, is the second son of Mr. and Mrs. J. Grice, of Charnwood House, Rothley Plain, Leicestershire. After leaving the Leicester Technical School, he spent three years at Messre Siemens Broad Dynamo Works, Stafford, prior to accepting a position with the Newcastle-on-Tyne Electric Supply Co., Ltd. After a stay of four years—during which time he was a member of the Newcastle Section of the Institution of Electrical Engineers, and gained an Institution premium for a paper read, Mr. Grice obtained an appointment with Messrs. A. Reyrolle & Co., of Hebburn-on-Tyne. When the war broke out, together with several friends he Tyne. When the war broke out, together with several friends he came to London and joined the Royal Engineers (Signal Co.).

Roll of Honour.—Private Robert Davies, of the 2nd East Lancashire Regiment, formerly in the employ of Messrs. Chas. Macintosh & Co., Manchester, has died at Boulogne from wounds

Manintosh & Co., Manchester, nas died at noungue from woulder received in the fighting at Ypres.

Private Tom Hayes, of Thornton, Fylde, who has been killed in the Gallipoli Peninsula, was formerly electrician at Rossall School.

Corporal John Albert Carroll, of the King's Own Royal Lancaster Regiment, Queen's Road, Harpurhey, Manchester, formerly employed by the National Telephone Co., Manchester, has been killed in action

at Ypres.

The Times reports that Senior Engineer Stanley John Reed, who lost his life in the Princess Irene, received his engineering training at Barrow, and was an expert in turbines and submarines. He had received the Telford Medal of the Institution of Civil Engineers for a paper on turbines.

115

## BUSINESS NOTES.

Consular Notes .- BRAZIL .- The Diario Oficial of March 2nd reports a new development of American enterprise in Brazil in the authorisation of the establishment of a branch in Rio de Janeiro of the National City Bank of New York. American Government has recently been studying carefully the question of the effect on trade with South America of the nationality of the banks, and has determined as far as possible to develop American hashing banks of the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South American banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking the South Banking

nationality of the banks, and has determined as far as possible to develop American banking business with South America, largely with the view of facilitating commerce with that country.

URUGUAY.—The American Consul at Monte Video reports that the new president of the National Power Houses Board, Senor B. Lascoity, Usina Electrica de Monte Video, has given out an interview stating the intentions of the Government in regard to electric power in Uruguay. The object is to give good service to the public and to devote profits to improvement of the service and the reduction of rates. It is hoped to reduce the rate for small industries in Monte Video from 5½ to 4½ cents per Kw.-hour, an advantage already enjoyed by the larger industries; those taking power on a larger scale get it for 2 cents. The board is also considering means to reduce the rates for poor people and for employés of the power house. The present tariff is 12 cents per Kw.-hour, and a reduction of from 2 to 4 cents is anticipated. Light and power will be extended to the principal towns. La Paz and Las Pildras are about ready. At Pando and Tacuarembo the power houses now building will be the principal towns. La Paz and Las Pildras are about ready. At Pando and Tacuarembo the power houses now building will be finished in four or five months. The Government expects to purchase the Corporation-owned power houses, and is already negotiating for those at Paysandu, Rivera and San Jose. It is stated that part of the profits of the national electric light and power system will be applied to the construction of the national telephone lines, which will be underground in the capital city and aerial in the interior. Tenders will be called for to supply either an automatic or a manual system, and the kind of system will be decided upon after the bids are made. The line will cover a wide area, embracing the capital and contiguous departments. The total cost is placed at about \$500,000. To effect all this the governmental power house (Usina Eléctrica de Monte Video) must be considerably improved. It is intended to increase its capacity with an alternating turbine of \$,000 kW. Another plan under consideration is to transform some of the boilers in order to burn crude petroleum, which is cheaper than coal and vacillates less in price.

There are two electric car lines in Monte Video—La Transatlántica, a German company, and the Sociedad Comercial, which is English. In addition, the Uruguayan Government operates a horse car line, the Tranvia del Norte. It has been decided to electrify this line, and a meeting of the directors will be held as soon as the President, who has been ill, can attend. Certain details will be decided upon and bids invited. It is estimated that about £300,000 will be spent for rails, cars, wires, &c.; in fact, everything will be purchased except (quipment for a power house) about £300,000 will be spent for rails, cars, wires, &c.; in fact, everything will be purchased except (quipment for a power house, which the Government already operates. The first work is to cover a line of about 10 miles, but will later be extended to twice that length. "The power house will necessarily be enlarged later, at which time there will be an opportunity to sell American machinery and equipment. The present machinery is of English make. The director from whom this information was obtained does not think it is worth while to send mail offers or catalogues. The only effective method is to send a representative who can close the deal in one or several lines. He should bring photographs or drawings and data to lay before the board, and be prepared to stay until the deal is completed. No further details can be had at present."

Catalogues and Lists.—MESSRS. OZONAIR, LTD., 96. Victoria Street, London, S.W.—Illustrated and priced leaflet

describing their Ozonair domestic water steriliser.

MIDLAND ELECTRIC MANUFACTURING CO., LTD., Stafford Works, Rèa Street South, Birmingham.—New catalogue (42 pp.) giving prices, brief particulars, and illustrations of their various "Mem" switchgear, including ironclad switches, switch and fuse units, supply panels, ironclad fuses and fuseboards, fuse carriers, tubular switches, open traction switches, accumulator switchboards, and other manufactures. The list contains a number of new lines, and an accompanying circular which refers to delays consequent upon war conditions, gives dates upon which delivery can be given of particular lines shown in the catalogue.

MESSES. BROWN BROS., LTD., Great Eastern Street, London, E.C.—Leaflet giving tabulated prices of round polished silver steel in 13-in. lengths.

MESSES. J. & W. B. SMITH, 15-23, Farringdon Road, London, E.C.—New illustrated price list (8 pages) of electric fans of ceiling, desk and bracket, ship and railway carriage types.

Lamp-Colouring Varnishes.--Messrs. Siemens Bros. DYNAMO WORKS, LTD., announce that owing to the increase in the price of aniline dyes they have found it necessary to advance the price of lamp-colouring varnishes by 20 per cent. The price of Siemens's lamp obscurer, which is an etching fluid, is also advanced 20 per cent.

Battery Manufacture in Spain. — La Sociedad Fabrica Nacional de Accumuladores, S.A., is the name of a new company which has lately been formed in Madrid to establish works for the manufacture of accumulators in accordance with the patents taken out by D. R. Serrano and D. José Mendoza.

Book Notices. - Micrometers. By A. W. Marshall and G. Gentry. London: Percival Marshall & Co. Price 6d. net.—
This little book will be found useful, not only by amateurs, for whom it was primarily intended, but also by engineering students, apprentices and others, who in these days of precision must be acquainted with the construction and use of refined instruments of measurement. All the appliances in common use appear to be included, and the treatment is lucid and interesting.

included, and the treatment is lucid and interesting.

Every Boy's Book of Electricity (Percival Marshall, price 1d.) is a simple introduction to electrical apparatus and the uses of electricity, in the plainest language, and with clear illustrations. It should have a wide vogue amongst our budding Edisons.

"Bulletin de la Société Internationale des Electricians." Vol. V.

No. 42. May, 1915. Paris: Gauthier-Villars, Price 3 fr.

"Tait's Electrical Directory of Australia and New Zealand."

1915. Melbourne: The Commonwealth Engineer. Price 5s. 1d.

Journal of the Institution of Electrical Engineers, Vol. LIII,

and Shipbulders." Vol. XXXI, Part I. May, 1915. Newcastle:
The Institution. Price 5s.

Private Arrangements.—Atlas Electrical Co., Ltd., High Street, Charing Cross Road, London, W.C.—A meeting of the creditors was held on Tuesday at the offices of Messrs. Peter the creditors was held on Tuesday at the offices of Messrs. Peter Thomas & Clark, solicitors, 53, Cannon Street, E.C. The statement of affairs presented showed liabilities of £670, all of which were due to trade creditors. The total assets were £714. From that amount had to be deducted £450 due on debentures, leaving net assets available for the creditors, subject to the costs of the receivership, of £263 16s. 4d. It was stated that the company was a private one and was formed in May, 1913, with a nominal capital of £100 divided into £1 shares. Debentures for £450 were issued for cash in November, 1913. When the company was formed only about 25 shares were subscribed for in cash. Recently creditors pressed, and the debenture-holders appointed a Receiver. The principal debenture-holder was Mrs. Clegg, the wife of Mr. W. H. Clegg, the managing director of the company, and that gentleman was appointed to act as the Receiver. After a short discussion, a resolution was passed in favour of an application-being made to the Court for the appointment of Mr. G. Corfield to act as the liquidator in the voluntary winding up. The following are oreditors: creditors :

£90 183 101 80 Fanger, J. United Incandescent Lamp Co.

W. T. CORNELL, LTD., electric light engineers, 4, Church Walk, Kensington, London, W.—A meeting of the creditors was held on Saturday, when the liquidator reported that the liabilities to the trade amounted to £210, while the assets were valued at £48. The company was registered on April 5th, 1914, with a nominal capital of £500 in £1 shares. The directors were Mrs. Cornell and her son. The former held 493 shares, while the remaining seven shares. were held by the signatories. The company was formed to acquire the business previously carried on by the late Mr. W. T. Cornell. The principal creditors were the General Electric Co., whose claim amounted to £130, and at their wish the meeting was adjourned.

J. T. MAYFIELD, electrical engineer, 63, Cannon Street, London, E.C.—A meeting of the oreditors was held on Monday, when a statement of affairs was presented showing liabilities of £605. The statement of affairs was presented showing liabilities of £605. The indebtedness to the trade was £535, and there was a partly secured cash creditor for £190. The business was originally carried on by the father, Mr. J. T. Mayfield, who died intestate in June, 1910. An arrangement was then entered into by which the debtor should take over the business and pay his mother an annuity of £200. The partly secured cash creditor was the debtor's mother, and her security consisted of an assignment of the book debts. After a short discussion, it was decided that a deed of assignment should be executed to Mr. G. E. Corfield, of Corfield & Cripwell, who was instructed to make a further investigation, and report to an adjourned meeting. adjourned meeting.

Prices Advance.—Messrs. A. P. Lundberg & Sons announce that in consequence of further increases in the costs of labour and material, the net amounts shown on invoices will be subject to an increase of 15 per cent. until further notice, instead of 5 per cent. as hitherto.

MESSRS, SIEMENS BROS. DYNAMO WORKS, LTD., announce that owing to increased prices of raw material, they have found it necessary to advance the list prices of fittings and glassware by 10 per cent. as from June 1st.

Bankruptcy Proceedings.—C. WRAY, mechanical and electrical engineers, Bradford.—A supplemental dividend of 7td, in the £ is payable to day (June 4th) at the Official Receiver's office, 12, Duke Street, Bradford.

Liquidation. — COAST DEVELOPMENT CORPORATION, LTD.—This company is winding up voluntarily, with Messrs. A. F Whinney and J. F. Stovell as liquidators.

Portland Cement Works for Queensland.—Owing to the shortage of German and Belgian supplies, a good deal of attention is being given to the manufacture of Portland cement in the Colonies and other places abroad where limestone, shale, or clay and coal can be obtained of suitable quality, and in sufficient quantities to make the manufacture likely to be successful and remunerative.

The Queensland Cement and Lime Co., Ltd., has now arranged to establish a works at Darra, near Brisbane. The plant is designed to produce about 40,000 tons of cement per annum. The complete contract for the supply and erection of the plant has been placed with Messrs. Noyes Bros. (Sydney), Ltd., engineers and contractors, who have had a large experience in connection with similar work in Australia.

The plant will be of the most modern description, and is all being obtained from British manufacturers. The grinding mills will be of the combination ball and tube mill types. The kiln will be 140 ft. long and 8 ft. diameter, and with the elevators, conveyors, slurry mixers, pumps, &c., will be electrically-driven, direct coupled wherever receible. rever possible.

The motors are for three-phase, .50 cycles, 440 volts, and the works will be complete with its own electrical generating plant, including alternators, direct coupled to vertical high-speed engines,

condensing plant, boilers, &c.

The general lay-out of the plant shows that it is expected that very soon the works will be duplicated, and later on further increased.

Bennis Contracts. -- Messrs. Ed. Bennis & Co., LTD, of Little Hulton, Bolton, inform us that something like 80 per cent, of the work on which they are at present engaged is in connection with War Office contracts. They have sent us an imposing list of other contracts recently placed, including the

Rotherham Corporation Electricity Station.—Four sprinkler stokers and compressed air furnaces for 8-ft, diameter Lancashire boilers; also two pair of chain grates, 6 ft, 6 in, wide by 11 ft, 5 in, long. Repeat order,

order.
Liverpool Corporation Electric Supply Department, Lister Drive Station.
—Relinking two chain grates of another make, with the Bennis patent links.

Hastings Tramways Co., St. Leonards-on-Sea.—Relinking four chain grates of another make, each 4 ft. wide by 11 ft. 8 in. centres.

Fire Prevented. -The sensitiveness of electric fire alarms was well exemplified in a recent instance when the Fire Brigade was automatically called to a printing office in the City at 10.35 p.m. There was no fire, but the heat given off by a gas jet, which had been left burning in a confined space, and had already blackened some wood laths, had sufficed to actuate the alarm in time to prevent an outbreak. The system was installed by Associated FIRE ALARMS, LTD.

Patent Application.—Mr. A. C. Hyde and the Vactite Wire Co., Ltd., have applied for restoration of Patent No. 17,817 of 1907 for "Improvements in making electrically conducting joints in metallic-filament incandescent electric lamps."

For Sale.—Offers are invited by the borough electrical engineer of Leigh (Lanes.), for the purchase of a boiler, 3,175 sq. ft. heating surface. MESSES. P. HUDDLESTON & Co. will sell by auction a large quantity of electrical apparatus, including motors, cable, switches, telephones, &c., at Dalling Road, Hammersmith, W., on June 9th. Particulars are given in our advertisement pages to-day.

Trade Announcement.-Messrs. Fletcher's Elec-TRIC FITTINGS Co., LTD., electrical fittings makers, are vacating their premises at 30, Sutton Street, Holloway Head, Birmingham. are vacating

## LIGHTING and POWER NOTES.

Aberdeen.—The Electricity Committee reports that the number of units of electricity generated last month showed an increase of 40,000 over the corresponding period of last year.— Aberdeen Journal.

Aylesbury.—E.L. SCHEME INAUGURATED.—The electricity works, constructed by the U.D.C., were opened on May 27th, the scheme being explained to the visitors by the resident engineer, Mr. W. H. Turnbull,

Bath.—The Diesel engine at the Corporation electricity works, which has been dismantled since early in 1914, is to be reassembled with the addition of certain improvements, at an estimated cost of £150, and will be running in about 10 weeks' time.

Birmingham. - YEAR'S WORKING. - The annual accounts of the Corporation Electricity Supply Committee, for the year ended March 31st, 1915, show that the total number of units sold as compared with the previous year was as follows:

Low-tension-			1915,	1914.
Lighting		•••	8,726,306	8,341,027
Power		•••	21,460,143	19,192,301
High-tension		• • • •	28,536,161	22,193,274
Tramway supply	•••	•••	24,186,574	24,040,573
	Total	•••	82.909.182	73.767.178

The total value of units sold was £379,625, compared with £346,561 in 1914. The output for lighting and power, excluding

tramways, shows a substantial increase, the units sold being 181 per cent. higher than in the previous year. The money value of this supply shows an increase of 14'1 per cent. The output for tramway supply shows an increase of 0.6 per cent. The gross profit on the undertaking was £192,376, and after meeting all charges for interest, &c., there remained a balance of £60,385, of which £25,000 has been carried to renewals fund, leaving £35,385, which it is proposed to carry to the credit of the borough rate. This is approximately £10,250 more than the contribution of the previous year.—Birmingham Daily Post.

Bispham .--Loan Sanction.—The U.D.C. has received from the L.G.B. sanction to a loan of £3,586 for E.L. purposes.

Blackburn.—New Scheme Deferred.—The scheme for the new generating station at Whitebirk has had to be deferred owing to the refusal of the Treasury and L.G.B. to sanction the necessary loan.

Bolton.—Increased Prices.—In view of the increased cost of generation, due to the price of fuel, the Electricity Committee has decided that, from May 28th, current for lighting be charged at 4d. per unit instead of 3'5d. For power purposes the charge will be increased over the present prices by about 10 per cent. For the first time for a number of years, no grant is being made to the relief of the rates.

-REDUCED E.L. CHARGES.—According Bournemouth. to a local paper, the Bournemouth, Poole and District Electric Supply Co. is making a reduction of '12. per unit in the price of current. This is equivalent to an 8 per cent. reduction.

Bury.—RATE RELIEF.—Of the profit of £2,088 on the electricity undertaking for the past year, £1,000 has been allocated towards the relief of the rates, and the balance has been pleased to recover form. placed to reserve fund.

Cape Province.—The ratepayers of Beaufort West have passed a resolution urging the Municipal Council to proceed at once with the electric lighting scheme, sanctioned eight months ago, but postposed owing to the war.

Carshalton.—Refuse Destructor.—The U.D.C. has decided not to join with other local authorities in the provision of a refuse destructor, it being considered that the power from a destructor cannot be utilised for other remunerative purposes.

Continental Notes.—Spain.—A new company has been formed in Barcelona with the title La Sociedad Central Electrica de Villarrodona to establish a small central station for the supply of electrical energy for lighting and power purposes in the town and district of Villarrodona.

FRANCE.—Our contemporary, the Gas World, quoting a French paper, refers to the damage done to Rheims gas and electricity

works. It appears that the electricity works were struck by two shells, damaging the machinery, and that both underground and overhead mains have been badly out about. The damage to the gasworks was much more extensive, but by prompt action serious results appear to have been avoided.

-The following persons have been granted per-Cuba.mission to install electric power and lighting plant:—Senor Wenceslao Súnchez Cifuentes, at San José de los Ramos, Province of Matanzas; Senores Pérez y Hno., at Nueva Gerona, Isle of Pines; Senor Lino Rodriguez, at Florida, Province of Camaguey; and Senores Abreu y Hno., at Florida. The Gaceta, which contains particulars regarding the installations to be carried out, may be consulted at the Commercial Intelligence Branch of the Board

Darlington.—Increased Prices.—In view of the high price of coal, and to meet the additional charges for war bonuses to employés, the Electricity Committee of the T.C. has increased the price of current for lighting by ½d., and for power by ½d. per

-LOAN SANCTION .- The T.C. has received the sanction of the L.G B. to a loan of £12,550 for E.L. purposes. The E.L. Committee has recommended the Council to increase the charges for current by 10 per cent. in consequence of the high price of coal.

Dublin.—YEAR'S WORKING.—The report of the Electricity Committee for the year ended March 31st last shows a net profit of £748 on the year's working, as compared with an estimated profit of £9,024. The falling off in consumption during the year was 284,000 units, representing £8,687. The decrease in the working expenses as compared with the estimates amounted to £2,753, but capital charges increased by £2,443. For the current year the capital debt charges are estimated at £55,653. If the present rates are retained the Committee estimates a deficit on the current year of, approximately, £21,334, and it is suggested that the deficit should be spread over more than one year by utilising the small reserve of working capital, which, with the slight profit of the year just closed, should amount to £9,600, and to make an increased charge of \$\frac{1}{2}d\$, on the lighting rates and \$\frac{1}{2}d\$. per unit on the power rates, the additional charge to be borne for two years.

Erith.—BULK SUPPLY. — The U.D.C. has decided, subject to the approval of the B. of T., to afford a bulk supply of current to the West Kent Electric Co., for distribution to houses being erected in Colyer's Lane,

Glasgow.—It is considered that the Electricity Committee will be faced with the necessity of increasing the rates both for lighting and for power by 10 per cent., owing to the increased cost of coal, &c.

Haslingden.—Revised Prices.—The Corporation has decided that the charge for electricity supplied to places of worship, workshops, offices, banks, warehouses, and to other shorthour users, be reduced from 5d. per unit to 4d. per unit from July 1st next. In future 2½ per cent. discount is to be allowed on accounts for electricity for heating purposes, provided payment is made within 14 days. made within 14 days.

Hebden Bridge.—In order to encourage the day load, the Electricity Committee has introduced a new scale of discounts, varying from 5 to 62½ per cent., according to quantity taken. If the total consumption exceeds 100,000 units a year, the excess units will be charged at &d. per unit without discount.

Hereford. — Year's Working. — During the year ended March 25th, 1915, the Corporation Electricity Department sold 1,303,800 units, as compared with 850,011 in the previous year, showing a phenomenal increase of 453,789 units, or 53 per cent. The power units sold numbered 1,039,114; the maximum load reached 585 kW., and the load factor 25'44 per cent. The generation cost per unit sold was '651d., as against '771d., and the total cost 1.52d. as against 2d. per unit. The average price obtained was 1.512d. per unit, this showing a surplus of £105 in the previous year. The total revenue was £8,215, and the gross profit was £3,605. The report of Mr. Kerr, the city electrical engineer, mentions that eight months of war had decreased the lighting revenue by £300; a deficiency of condensing water—since remedied—is also estimated to have made a difference of £300 in production costs, and in addition the rising price of fuel has adversely affected the costs. Over 120 consumers were added during the year, and the consumption per head of were added during the year, and the consumption per head of population is now 56.73 units.

Owing to the increased cost of production and the decreased consumption of current, the Electricity Committee has decided to

increase the charges for current, except where prices are fixed by

contract, by 10 per cent. as from June 1st.

Holmfirth.—E.L. SCHEME.—The erection of the generating station for the E.L. scheme has been commenced by Mr. R. Turner; the poles for the overhead lines are being put up by Messrs. Broadbent.

India.—ELECTRICAL MINING REGULATIONS.—According India.—Electrical Mining Regulations.—According to Indian Engineering, the question of arranging for a more systematic inspection of electrical installations in coal mines in India is at present under the consideration of the Government of India. At present inspections of electrical machinery, whether installed in mines or elsewhere, are made by Inspectors under the Electricity Act. In order to make them more thorough and effective, an Inspector under the Electricity Act will probably be required to reside permanently in the principal coal-mines area, probably at Dhanbaid, and to devote practically all his time to inspections of installations at the mines.

London.—At the recent conference between the County Council and municipal electricity suppliers in connection with the London electricity supply, it was pointed out to the L.C.C. that to ensure any Bill it might wish to bring in being successful, it would be necessary to consult the B.C.s before the Bill was formulated and not after it was drawn up, so that the B.C.'s suggestions might be embodied. According to the *East London Advertiser*, the L.C.C. has agreed to meet the Councils concerned on the question.

Mansfield.—The T.C. has decided not to increase the generating plant at the electricity works at the present time on account of circumstances arising out of the war.

-Electric Cooking, Street Lighting, &c. The T.C. has decided to purchase, at a cost of not exceeding £40, suitable electric cooking apparatus, and to grant a war bonus to the electricity works staff. Provided the order for conversion is placed at once by the Highways Department, the Electricity Committee has decided to take over and light 97 street gas lamps on the route of existing mains in November next. There was a net profit of £878 on the working of the electricity

undertaking during the year ended March 31st last,

Salford.—PRICE INCREASE.—The Electricity Committee has decided that the price of energy for lighting and power be increased 7½ per cent. from July 1st next, except as regards that supplied to the tramways department, or under special agreements for unexpired periods, entered into prior to October 1st last.

Sidmouth.—Refuse Destructor.—The question of providing a refuse destructor for the urban district has been deferred, owing to the refusal of the L.G.B. to sanction a loan for

Southampton.—Electric Vehicles, Loans, &c.—In view of the successful operation of the electric van which was put into service recently, the Electricity Committee has decided to exercise its option on an additional chassis, and equip the same for use on the mains. At the outbreak of war the Government for use on the mains. At the outbreak of war the Government commandeered the 500-kw. rotary converter on order from the

British Thomson-Houston Co. In view of the fact that since the Stritch I domson-Houston Co. In view of the fact that since the service of tramcars has been increased, the electrical engineer now supplies the cars from the 1,000-kw. sets, the company was approached as to the cost of a 750-kw. set arranged so that the tramways could be supplied from it when required. It has now been decided to purchase the machine at £1,909, and to apply to the L.G.B., for sanction to borrow the cost. In reply to the Council's application for further sanction to loans of £8,000 and £6,000 for mains and services, the L.G.B. has intimated that it is not prepared to give its sanction unless in respect of extensions to factories engaged in the making of munitions.

Southport.—PRICE INCREASE.—Au advance of 10 per cent. on the price of electricity to consumers for all purposes is to take effect from June 24th next. Following the lead of Southport, the Birkdale District Electric Supply Co., Ltd., which supplies the Birkdale area, has announced an increase in the price of electricity of 10 per cent. of 10 per cent, to commence on June 30th.

Spenborough.—Price Increase.—A new scale of the electrical charges has been prepared in connection with the Council's electricity undertaking, which will operate from July 1st, and provides for (a) the abolition of a 10 per cent. addition on the net amount of consumers' accounts, which came into force on the net amount of consumers' accounts, which came into force on January 1st, 1913; (b) that charges for current for heating and power be  $2\frac{1}{2}d$ . per unit on a minimum consumption of 150 units per quarter per H.P. of demand, and  $1\frac{1}{2}d$ . per unit above such minimum, with sliding scale discount for payment within a month of demand; and (c) that the charge for lighting current be  $4\frac{3}{2}d$ . per unit, with a discount of 5 per cent. for payment within a month of demand.

Stalybridge.—PROPOSED LOAN.—The Joint Tramways and Electricity Board has decided to apply to the L.G.B. for sanction to borrow £4,000 for transformers and mains for munition

L.G.B. sanction has been received to the borrowing of £12,921, and mains extensions are to be carried out.

Walthamstow.—Increased Prices. — The Lighting Committee has decided to increase, as from the June quarter, the prices charged for current by 15 per cent., except in the case of contracts. As regards prepayment meters, it is proposed to charge the consumer an equivalent of 15 per cent. upon the sum taken from the meter. The engineer is to negotiate with those consumers who have period contracts, with a view to their paying the increased price without prejudice to the terms of the contract.

West Bromwich.—YEAR'S WORKING.—The accounts West Bromwich.—Year's Working.—The accounts of the electricity undertaking for the year ended March 31st last show a net profit of £878, which is to be carried to net revenue appropriation account. The total income of the undertaking was £20,252, or an increase of £1,938 as compared with the previous 12 months. The receipts from the sale of current show an increase of £1,824. The L.G.B. has sanctioned the borrowing of £3,300 for mains and £3,444 for new boiler, pipework, feed pump, transformer, switchgear, regulator and cable connections. Application is to be made for the consent of the B. of T. to put up another overhead main in order to give a larger supply of current to the premises of Mesers. J. Brockhouse & Co., Ltd.

Wharfedale.—Proposed E.L. Scheme.—The conference of representatives of various local authorities to consider the possibility of a joint scheme of electric supply, in view of the withdrawal of the Yorkshire Electric Power Co.'s Bill, was held last week at Yeadon. Representatives were present from the Councils of Yeadon, Rawdon, Guiseley, Otley, Burley and Wharfedale Rural Councils. A resolution was adopted in favour of the production of the current inside the area covered by the local authorities represented, and a committee was appointed to obtain information as to the cost of purchasing energy in bulk from every available company or Corporation within reach, and also as to the best means and the cost of obtaining a combined provisional order.

Worcester.—WAR BONUSES.—The Electricity Committee has recommended the T.C. to grant a war bonus of 2s. 6d. per week to certain members of the electricity works staff, and 2s. per week to others.

## TRAMWAY and RAILWAY NOTES.

Australia.—A very large expenditure is contemplated in connection with the electric tramway extension for the eastern suburbs of Melbourne. Two lines already in hand involve an estimated expenditure of £215,000, and other lines are in contemplation involving a further expenditure of £148,500.—Melbourno

Birmingham. - YEAR'S WORKING. - The annual accounts of the Corporation tramways department for the year ended March 31st last show a total revenue of £647,014, as against £635,471 for 1914. Working expenses amounted to £473,879, as compared with £445,507 in the previous year, leaving a gross balance of £173,135,

and after paying interest and sinking fund charges, the net surplus for the year was £47,596, of which £17,596 was placed to reserve fund, the balance, £30,000, being transferred to the credit of the borough rate account. The total car-miles run were 14,232,902; the average traffic revenue per car-mile 10'793d., as against 10'563d.; the average working expenses per car-mile 7'991d., as against 7'494d. in 1914; and the percentage of working expenses to receipts 73 as against 70 per cent. in the previous year. It is believed that the loss in traffic due to the war was between £40,000 and £50,000 .- Birmingham Daily Post.

Bolton.—Strike.—A settlement of the tramway strike was arrived at on Tuesday, and the car service was resumed on Wednesday, after three days of idleness. The men returned to work in consequence of an offer made by the Committee that no notice would be put up requiring them to work proposed extra cars; this overtime will be worked voluntarily. A further promise was made to the men that other grievances would be considered.

Chester.—The Tramways Committee has received a letter from Capt. Gosset, stating that it was quite possible that senction could be obtained for wounded soldiers, who were unable to return to the Front, to soccept positions as tram conductors, and so relieve those eligible for enlisting. The Committee has agreed to employ such men as are capable of doing the work, as vacancies

Coventry.—FEMALE LABOUR.—Women conductors are to be employed on the less frequented tramway routes.—Birming-ham Daily Post.

Glasgow.—YEAR'S WORKING.—The tramway department's financial year closed on May 31st, and it is stated the net ment's mancial year closed on may 31st, and it is stated the net receipts will reach £1,070,353, or about £8,000 below the record total of last year. The number of passengers carried was about 300,000 less, though this is looked upon lightly, as last week, for instance, the number of tickets issued reached the remarkable figure of 7,039,490. This represents more than the total population of the city patronising the cars daily.

Hull.—YEAR'S WORKING.—A net profit of £14,574 was made on the tramways for the year ended March 31st last £10,000 of this has been allocated towards relief of the rates, and a sum of £6,076 has been carried to reserve fund.

London.—L.C.C. TRAMWAY STRIKE.--The executive of the two Tramwaymen's Unions decided late on Monday night to recommend all L.C.C. tramway employés who are

above military age to return to work.

A notice was issued on Monday by the Council's tramway manager that since the majority of the men above Army age have returned to work, although men who are eligible for service in the Fore:s will not be taken back, those who enlist will receive favourable consideration for reinstatement, as far as may be possible, after the war; and any man of military age unable to enlist may appeal to the chief officer and state his reasons, and he will consider whether any special circumstance allows a secretical contents. will consider whether any special circumstances allow an exception to be made in his case.

The M.E.T. Co.'s employés have all returned to work, the company having made no stipulation in regard to enlistment.

Newcastle-on-Tyne. - FEMALE LABOUR. - At a meeting of the Tramways Committee on May 26th, the general manager reported that since the last meeting 48 women conductors had been trained, 24 were in full charge of cars, and the rest were in training on cars. Their employment had been an unqualified success, and had surpassed all anticipations. Applications for further women conductors were desired. The Committee decided to abolish 31, workmen's fares, the minimum fare to be 1d.

Ramsbottom.—Railless Traction.—The first of the new railless cars, which has been built on stronger lines than the earlier ones was delivered last week, and a trial run was stated to be satisfactory. The chassis is heavier, the wheels larger in diameter and provided with wider tires, while more flexible springs are fitted. Another car is on order, and the older cars are to be altered to conform with the new design.

Salford.—FEMALE LABOUR.—The women who have been training as tramway conductors are to be on duty about  $z_1$  hours daily (Sundays excepted), to work "emergency cars" in the mornings and evenings, when people are going to or from business. Mr. G. W. Holford, general manager, has addressed a notice to the men exp'aining the circumstances under which the women are being employed and asking the men to assist the new-comers as far as possible. A notice has also been issued in which the Tramways Committee appeals for the kind co-operation and consideration of the travelling public under the new conditions.

Stalybridge. — The Stalybridge, Hyde, Mossley and Dakinfield Joint Tramways and Electricity Board, on May 26th, sealed precepts on the four Corporations amounting in the aggregate to £7,000, being the amount of the deficiency in the net revenue of the Board to March 31st last.

Sunderland .- YEAR'S WORKING .- During the past year the Corporation tramways earned a total revenue of £75,616; the total working expenses were £11,549, and the amount carried to net revenue account £34,066. Interest on capital absorbed £6,463; repayment of loans, £10,374; renewals fund, £9,602, and £5,000 was paid to the brough fund in aid of the rates. The reserve and renewals fund, which stood at £39,508 on March 31st, 1914 is now increased to £45,014. 1914, is now increased to £45,044.

-SUBURBAN RAILWAY ELECTRIFICATION.—The U.S.A.report of the engineer of the Wisconsin Railroad Commission. following an investigation of transportation facilities in the metropolitan district of Boston, recommends the electrification of the following lines centring in that city, which the Public Service Commission promises to consider with a view to their gradual conversion:—The Saugus and Medford branches of the Boston and Maine Railroad; the West Roxbury branch of the New Haven, and the Newton Circuit of the Boston and Albary Line. These and the Newton Circuit of the Boston and Albany Line. These are steam-operated at the present time, and it is proposed to reconstruct them by the laying of parallel track for local trains which would be run from the termini of the Boston Elevated Railway's present tunnels and elevated structures. The scheme contemplates the creation of three main routes intersecting at the centre of the branch; about \$15,000,000 would be required.—

**Electrical Review and Western Electrician.**

NOBFOLK AND WESTERN ELECTRIFICATION.—According to the Railway Garatte, this is the first line where the high power also.

Railway Gazette, this is the first line where the high-power electric locomotive has superseded the Mallet compound steam locomotive. The line electrified is in the Pocahontas coalfield, about motive. The line electrified is in the Pocahontas coalfield, about 35 miles in length, and the traffic consists principally of coal. This is handled under closely competitive conditions, and a very large volume has therefore to be moved in order to make the traffic profitable. At present the amount carried daily is from 40,000 to 60,000 tons, and it is conveyed in trains weighing about 3,250 tons, consisting of steel hopper cars of 100 tons capacity carried on six-wheel bogies. There are long and heavy grades, rising 1 in 75 and 1 in 100, and a long 1 in 50 down grade. Hitherto, three Mallet compounds have been required, and the average speed has been 7 M.P.H., but with the new electric locomotives, the motors of which, during acceleration, develop as much as 11,000 H.P., and while running at regular speed on the up grade a continuous output of 8,000 H.P., take the trains at an average speed of 14 M.P.H. In view of the serious financial strain through which the railways of the United States are now passing, and the fact that no railway would at present undertake electrification unless the prospects were very reassuring, the work now being done on the Norfolk & Western, and on the Chicago, Milwaukee & St. Paul, is very significant. is very significant.

West Bromwich .- YEAR'S WORKING .- The net profit of the Corporation tramways last year was £192, which is to be carried forward. On the other hand, on the motor buses there was a net deficiency of £135, which will be a charge on the borough fund during the current year.

York.--TRAMWAY EXTENSION.—The L.G.B. has sanctioned the proposed extension of the tramways from Nessgate to Hull Road.

## TELEGRAPH and TELEPHONE NOTES.

A Telegraph Spy.—It is reported that the parish priest of Caporatto, an Austrian village, has been court-martialled and shot by the Italians for treasonably communicating with the Austrians by means of a secret telegraphic apparatus.

Argentina.—It is announced at Buenos Ayres that telegrams for Germany and Austria must in future be sent by way of the U.S. wireless station at Sayville.—Journal Telegraphique.

New Cable.—The Greek Ministry of Ways and Communications has decided to connect the Epirus with the Isle of Corfu by a submarine cable via Santiquaranta. -Télégraphique.

North Sea Cable.—It is reported that Great Britain has given the Norwegian Government a guarantee that she will respect the Great Northern Telegraph Co.'s steamers while they are repairing the Anglo-Norwegian cables. Norway has asked Germany to give a similar guarantee, but no reply has been received.

Panama Canal.—The U.S.A. Government is building three steel towers 198 m. high near the Canal, to carry the antenue for the Panama wireless station. The towers measure 45 m. wide at the base and 3 m. at the top, and will weigh about 1,000 tons .- Journal Telegraphique.

Straits Settlements.—The American Consul at Singa-Straits Settlements,—The American Consul at Singapore reports that a permanent wireless station at Singapore has recently been erected to be controlled by the Government. It was anticipated that the plant would be in operation by the middle of April. The apparatus is a complete Marconi 5-kw. outfit, having a range of 400 miles, which can be exceeded under favourable conditions. The towers are 250 ft. high, and the total cost is estimated at about £23,000. At the outbreak of war a temporary wireless station was erected on the top of a building in the centre of the city, but it is not a high-power station, and has been maintained for the Naval Intelligence Bureau. It is aunounced in the Government Gazette of the Federated Malay States that 10 acres have been acquired in Penang and Butterworth for a wireless telegraph station. for a wireless telegraph station.

Truguay.—Dr. Enrique Wilson, on behalf of a North American syndicate, has applied to the Government for permission to establish a powerful wireless telegraph station, with which Uruguay would be able to communicate directly with Panama and New York, and by means of these stations, with Europe.—

Review of River Plate. 400 S

## CONTRACTS OPEN and CLOSED.

Aberdeen.—Corporation Electricity Works. One year's supply of small steam coal. Mr. J. A. Bell, City Electrical

Australia. - Melbourne. - July 14th. Victorian Railway Commissioners. Supply of 60,000 flame are carbons for use in Ganz flame are lamps (Contract 28,811).—Australian Mining Standard.

Victorian Railways. July 14th. Aluminium feeder, insulators, anchoring clamps, &c., for the St. Kilda-Brighton electric atreet railway. Contract No. 28,817. Particulars at Contractor's Room, railway. Contract No. 28, Spencer Street, Melbourne.

Spencer Street, Melbourne.
August 11th. One 1,000 kw. D.C. generator complete, liquid starter, &c., for City Council. See "Official Notices" to-day.
ADELAIDE. — July 14th. Galvanised-iron wire, for P.M.G.'s Department. See "Official Notices" to-day.
SYDNEY.—July 12th. Metropolitan Board of Water Supply and Sewerage. Two steam turbines and condensers at Ryde pumping station, for the Chatswood pumping plant. Secretary, 341, Pitt Street, Sydney.
July 19th. Council. Meters for the Electric Light Department, Town Hall. Specification 10s. 6d.
July 19th. Council. Maximum-demand indicators. Specification (10s. 6d.) from Electric Light Department.

(10s. 6d.) from Electric Light Department.

July 19th. Municipal Council. One or two 12,000 kw. turbo-alternators (Contract No. 363). A copy of the specification can be obtained from the City Electrical Engineer, Sydney.

July 19th. Steel towers for 33,000-volt transmission line. Specification (10a. 6d.) at E.L. Department, Town Hall.

July 21st. N.S.W. Government Railways and Tramways Department. One 250-K.V.A. turbo-generator.*

PERTH.—July 7th. Deputy P.M.G. 31,000 porcelain or alternatively stoneware insulators (Schedule 432 W.A.).*

Specifications for the items marked * can be seen at the B. of T. Commercial Intelligence Branch in London.

Birkenhead.-June 10th. Rough slack (washed and unwashed) and small coal (washed and unwashed) for the electricity stations for six or twelve months. Borough Electrical

Bridlington.—2,000 tons of coal, for the Corporation electricity works. Mr. A. J. Beckett, Electrical Engineer.

Cleckheaton.—June 9th. Slack coal (3,000 tons) for the Spenborough U.D.C. electricity works. Mr. J. H. Linfield, Clerk, Town Hall.

Dublin.—June 7th. Electric passenger lift for Irish United Assurance Society. See "Official Notices" May 28th.

Eccles,—June 9th. Corporation. Installation of the electric light at the Auson Street Council Schools, Winton. Forms of tender (10s.) from Mr. E. Parkes, Town Clerk, Town Hall.

Edinburgh.—June 21st. Two 5,000-kw. turbo-alternators and condensing plant, for Portobello supply station. See "Official Notices" May 21st.

Glasgow. - June 7th. The Trustees of the Clyde Navigation invite tenders for a year's supply of electrical stores. Mr. T. R. Mackenzie, General Secretory and Manager, 16, Robertson

-June 10th. U.D.C. Six or twelve months' supply of Griff, Babbington or Stockingford hard steam coal for the electricity station. Electrical Engineer, Grays Thurrock U.D.C.

Kirkcaldy.—June 14th. Corporation. 100 half-watt 1,000-c.P. lamps and lanterns for street lighting. See "Official Notices" May  $28 \, \mathrm{th}$ .

London.-L.C.C.-June 4th. Installation, 260 wiring points, 345 lights, also electric bells, at the County Secondary School, South Hackney. See "Official Notices" May 21st.

St. Panchas.—June 14th. Corporation, Twelve months' supply of Welsh and steam coal for the electricity stations and baths.

WEST HAM.—June 14th, Installation of lighting and water-heating apparatus at Knox Road Special School, for Education Committee. See "Official Notices" May 28th.

Manchester.—June 16th. 40-kw. steam dynamo for Cottage Homes, Styal, for Manchester Union. See "Official Notices" to-day.

Rangoon.—August 11th. Installation of a system of fire-alarms for the municipality. Specification (10a.) from Messrs. Ogilvy, Gillanders & Co., 67, Cornhill, E.C.

Redditch.-June 14th. H.T. three-phase switchboard. See "Official Notices" May 28th

U.D.C. Water-storage tank electricity works. See "Official Rhondda.—June 4th. (30,000 gallons), for Porth electricity works. See Notices" May 28th.

Tasmania. — Launceston. — July 26th. Sub-station equipment. Section I, Converter machine, switchgear, &c.; Section II, Underground feeder cable. Specification (21s.) from the City Electrical Engineer, Town Hall.

-July 5th. Lead-covered telephone cables; glassware and other material for batteries; telephone instruments, & 2., for P.M.G.'s Department. See "Official Notices" May 28th.

### CLOSED.

Bridlington.—The Electricity Committee recommends the acceptance of the tender of the New Destructor Co., Ltd., at £6,332, for a refuse destructor on a site adjoining the electricity

Buxton.—The U.D.C. has accepted the tender of Messrs. Day & Ferguson for 2,000 tons of Pilsley hard slack coal for the electricity works.

Derby.—The T.C. has sealed a contract with the Derby Kilburn Colliery Co., Ltd., for coal for the electricity works.

-The Corporation Committee of Supplies has recommended the acceptance of the tender of Messre. J. McKelin and Co., for 12 months' supply of Scotch steam nute, at 25:. 11d. per top, for the electricity generating station.

Hammersmith. - The Electricity Committee reports that for the annual supply of box frames, covers, boxes, &c., Messrs. W. Lucy & Co., the second lowest tenderers, have intimated that they would require an additional 7½ per cent. on the prices tendered by them. In view of this increase and that the requirements of the department will be less than was anticipated, the Committee recommends the purchase of these items in the open mark it as favourable opportunities occur. The Committee reports the purchase of 50 tons of Babbington 2-in. slack coal, at 19s. 6d. per ton.

Haslingden.—The Tramways and Electricity Committee has accepted the tender of Mr. J. Milne, for petrol required during the period ending March 31st next.

Leyton.—The U.D.C. has entered into contracts with the Electrical Apparatus Co., Ltd., the British Thomson-Houston Co., Ltd., and the Reason Mauufacturing Co., Ltd., for ordinary meters, and with the B.I. and Helsby Cables, Ltd., for slot meters, for a period of twelve months.

Manchester.—The Engineering Sectional Committee of the Education Committee has approved the renewal of certain

plates in the Tudor storage battery, at £250.

The Education Committee has accepted the tender of Messrs.

R. Seddon and Sons for installation of electric light at the new Islington School Clinic, and the tender of Messrs. R. O'Brien & Co. for a telephone at Alder House.

The following tenders have been accepted by the Electricity

Committee :-

Three 1,200 K.Y.A. static transformers.—British Westinghouse Co. Cable.—B.I. & Helsby Cables, Ltd.
Purchase of scrap copper and scrap cable.—B.I. & Helsby Cables, Ltd.

The Tramways Committee has accepted the tender of Messre. Isaac Bentley & Co., Ltd.. for lineeed oil.

Meter Contracts.—Messrs. Ferranti, Ltd., have secured a contract from Glasgow Corporation for the supply of continuous-

current electricity meters for the year ending May 31st, 1916.

Messre. Chamberlain & Hookham, Ltd., have received contracts for meters for the coming year from Glasgow and Falkirk.

The Hornsey B.C. has placed a contract with the British Thomson-Houston Co., Ltd., for their direct-current ampore-hour meters for 12 months.

New Zealand.—WHANGAREI.—For electric wiring and the installation of meters for the B.C. the following tenders were received :-

National Electrical and Engineering Co., Ltd. .. (accepted) 27,946 

-New Zealand Shipping and Commerce.

Salford.—The Electricity Committee has accepted the following tenders :-

H.T. cubicle and control panel, £371.—British Westinghouse Co. Wet air filter, £327.—Heenan & Froude, I.td. Transformer, £160.—Ferranti, Ltd. Purchase of scrap copper, £154 (approx.).—B.I. and Helsby Cables, Ltd.

South Africa. - The Johannesburg Municipality has accepted the tender of the Telegraph Manufacturing Co. for five miles of trolley wire, at £99 15s. per mile. - S. African Mining Journal.

## FORTHCOMING EVENTS.

Association of Mining Electrical Engineers (Notts. and Derbyshire Branch).—Saturday, June 5th. At 3 30 p.m. At University College, Nottingham. Paper on "Experinces with Electrical Plant," by Mr. A.

Royal Institution of Great Britain.—Monday, June 7th. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 5 p.m. At 11 a.m. In the rooms of the Geological Society, Burlington House, Piccadilly, W. General Meeting.

Friday, June 11th. Visit colliery sinkings near Coventry.

North of England Institute of Mining and Mechanical Engineers.— Haturday, June 19th. At 2 p.m. At Newcastle-on-Tyne. General Meeting.

Salford Technical and Engineering Association,—Saturday, June 12th.
Visit. Manchester Corporation Electricity Works, Stuart Street Power

#### NOTES.

The Electrical Future of Belgium.—With reference to our leading article on this subject and the full report of a paper by M. Steylaers, we have pleasure in publishing the following

"Sir,-Referring to our letter dated 17th ult. we are now in a "Sir,—Referring to our letter dated 17th ult. we are now in a position to inform you that we intend to convoke a new meeting between the Belgian and English manufacturers within two or three weeks. We will inform you the exact date within a few days. The Belgian Committee for Trade with the Allies have put their rooms at our disposal in 43, Shoe Lane. Will you be in a position to induce the English manufacturers to attend this meeting, which seems more necessary than ever to begin to talk about taking energetic measures towards the production of our future business against German trade?

"I do not know whether you are fully aware of what is happening at the present time in Germany with regard to preparing for the economic struggle with the Allies after the war. It will be sufficient to state that at the present time already hundreds and thousands of small labels are being made in Germany in electro-type with the mention, 'Not made in Germany.' Do you see what this means? Are you fully aware that Germany after the war is going to conduct, through neutrals and even through many of our own countrymen, a campaign against her own goods, and is going to brand her own goods with her own labels, 'Not made in Garmany'?

"This may be something like a false signature, but we are

already getting accustomed to such mean acts, which would be reproved by the honest tradesman. I will tell you something more. Are you aware that already now active steps are being taken by German business men with neutrals, and also with Belgian and English people, to induce them to act after the war on behalf of German trade, as what we call in French Prite Nom? This means that :

(1) The Germans realise perfectly that they have absolutely lost

(2) That they have absolutely lost the goodwill;

(3) That they consider the end of the war to be much nearer than many people think, a fact which they know better than ourselves, because they can calculate better what is their real power and resistance on the economic point. All these facts stated above are proved by personal witnesses actually in Germany who are studying these economic sides to the very foundations.—Yours faithfully,

"R. STEYLAERS.

"7, Idol Lane, London, E.C., June 1st, 1915."

The Latest "Magnetic" Invention.—One of the most bare-faced devices to ensure the credulous that we have ever met with has recently been brought to our notice by the city electrical engineer of Londonderry, Mr. R. V. Macrory, who laments the fact "that hands are now employed in producing such rubbish at the present time, when so much useful work is being delayed." It consists of two thin wires, of iron and some other metal, about 7 in. long, twisted and soldered together at one end like the letter Y, with the tail of the Y coiled in the form of a small helix. This device is called the "sun-ray magnet," and is described in cleverly-written leastet ("No. 1, Vol. I") as a "Great scientific gardening discovery," a "simplified 'wireless' method of electrifying the soil and its plant life with 'Sun-Ray Magnets.'" The leastet is ornamented with quotations from Swift and Emerson, and on the last page, with consummate impudence, refers to our articles on the uses of electricity in agriculture and horticulture. The two straddled legs of the "magnet" are to be pushed into the soil a few inches from the plant, in a position The Latest "Magnetie" Invention.—One of the horticulture. The two straddled legs of the "magnet" are to be pushed into the soil a few inches from the plant, in a position "that is most open to the sun and the atmospheric electric currents." If the soil is hard, it should be loosened all round the plant—a process which, it will be noticed, is itself likely to aid plant growth, though the improvement will, by the superficial, be attributed to the use of the "magnet." Careful instructions are attributed to the use of the "magnet." Careful instructions are also given to water the plant regularly, on the score that "a plant aided by a 'Sun-Ray Magnet' is able to absorb more moisture," and we are artlessly informed that "in continuously dry soil the Electrically-stimulated plant does, perhaps, less well than without Electricity". As a proof that the "Magnet" possesses electrical properties, the two ends are shown connected to a sensitive galvanometer, while the soldered junction is held between the and thumb. Naturally, the thermoelectric current thus produced deflects the needle, and the doubter is convinced. But it is claimed that in use "the 'Sun-Ray Magnets act as 'conductors' of the Infinite Electrical Currents of the atmosphere,"

We will not follow the leasiet through its ingenious manipula-We will not follow the leasiet through its ingenious manipulations of genuine experimental facts on the effect of electricity on the growth of plants, its clever illustrations of plants alleged to be grown with and without the "sun-ray magnet," its specious arguments, undoubtedly compiled by some person of education and ability who ought to be better employed. We only hope that our readers will miss no opportunity of putting their florists, seedsmen, ironmongers and other tradesmen on their guard against this plausible imposition—which is priced at 1s. for 6 and 5s, for 40. for 40.

I.M.E.A. Meeting, 1915.—The twentieth annual general and business meetings, which this year take the place of the usual Convention, will be held in London at the Institution of Electrical Engineers, Victoria Embankment, W.C., on June 17th and 18th, as follows:

follows:—
June 17th, 10 a.m.—Report by A. S. Blackman (Sunderland) and
T. Roles (Bradford), on behalf of Point Five Association, on "The
Practical Result of the Point Five Tariff," followed by a discussion.
2.30 p.m.—Report by F. Ayton (Ipswich) on "The Use of
Electrical Vehicles in Municipal Service," followed by a discussion.
5 p.m.—Parade and demonstration of electrical vehicles on the

Embankment.

June 18th, 9.30 a.m.—Council meeting.

10 a.m.—Annual general meeting.

A meeting of the Point Five Association will also be held at Tricity House, Oxford Street, W., at 7 p m., on June 17th.

The Council's headquarters will be at the Hotel Cecil. The usual

visitors' list will on this occasion be suspended; there will be no social functions, and it is not proposed to invite ladies. The meetings will be restricted to members and official delegates, and these are invited to consider themselves hon members of the Municipal and County Club, Whitehall Court, on the dates mentioned.

The secretary is Mr. C. McArthur Butler, 28, Bedford Square, W.C., to whom inquiries should be addressed.

Cricket Match. - A match - British Westinghouse Electric and Manufacturing Co., Ltd., Supply Department v. Harland Engineering Co.—was played at Birohdelds Park, Manchester, on Wednesday evening, May 26th, the result being an easy win for the former. The following are the scores:—

Indian Notes.—Our Indian correspondent writes:—
Naini Tat.—The United Provinces Government have before them
a scheme for a hydro-electric installation for the hill station of a scheme for a hydro-electric installation for the hill station is Naini Tal, which is about 7,000 ft. above sea level. The town is a fairly populous one in the hot season. There are at present three or four isolated electric plants, but coal fuel is extremely expensive, oil is also costly, and the Forest Department look with disapproval on wood-consuming plants; hence it is that a bydro-electric plant is looked on with much favour. The details of the latest and the plants is the station of the latest and the plants are not extend to the plant tenders may be safed for within scheme are not yet obtainable, but tenders may be asked for within a reasonable time

The electrical inspector to the United Provinces, Mr. Tufnell, has just taken a commission in the Army, and has left India for the front in Flanders; he has left a very capable assistant, Mr. Warren, to take over his duties during his absence. Electrically speaking, the United Provinces is tremendously busy just now, with Lucknow, Allahabad, Agra, and possibly Bareilly and Naini Tal on the cards, each for electrification within the near future. Progress may, however, be slow as the capital for the undertakings has to be obtained not from Government, but from the public, and at the present moment capitalists are not over anxious to come forward and put their money into undertakings no matter how probable might be their success. The electrical inspector to the United Provinces, Mr. Tufnell,

Acetylene Corrosion.—With the increasing use of acetylene gas the risks of its corrosive effect on pipes and metal containers should be better known. Tests have shown that moist containers should be better known. Tests have shown that moist acetylene, as generated, attacked zinc, lead, brass and nickel to a alight extent; iron was affected at about six to seven times the ra's; phosphor-bronze about twice as much as iron; but copper suffered more than any other metal tested. Copper was quickly changed into a soft, porous black mass. Tin, aluminium, bronze, german silver, and solder were practically unaffected. Thus it would appear that copper and brass or other copper alloys should not be used as piping for acetylene gas supplies, and that iron should be well tinned rather than galvanised or nickel-plated.—

## ADMIRAL SIR HENRY JACKSON, K.C.B., F.R.S., M.I.E.E.

The announcement that Admiral Sir Henry B. Jackson has been appointed First Sea Lord of the Board of Admiralty, in succession to Lord Fisher, is of particular interest to our readers, on account of the fact that he is a member of the Institution of Electrical Engineers, and has attained to a high place in the scientific world, being one of the very few naval officers who have been honoured with the highest distinction that science can bestow—the Fellowship of the Royal Society. The new First Sea Lord is comparatively unknown to the general public, but electrical men cannot fail to be aware of the important

aware of the important position which he occupied when, as Captain Jackson, he was engaged in developing the applications of wireless telegraphy to naval operations, and in adapting the apparatus to the conditions met with on board ship.

As a matter of fact. Sir Henry Jackson's connection with wireless telegraphy goes back a great deal further than is generally known, for as long ago as 1891, shortly after his promotion to commander of H.M.S. Edinburgh in the Mediterranean, his thoughts were occupied with the problem of communication between warships by means of Hertzian waves; we may point out that Prof. Lodge's first public demonstration of the transmission of signals by this agency was performed at Oxford in 1894, and Mr. Marconi carried out his demonstrations in conjunction with the Post Office in 1897, so that the claim of Commander Jackson to be one of the earliest investigators in this region cannot be disputed. Continuing the work in his spare

time, he succeeded in effecting communication over short distances in 1895, when he was commander of the torpedo training ship Defiance, at Devonport; his experiments were known to the Admiralty, but were treated as confidential matters. In 1896 he made the acquaintance of Mr. Marconi, and it is said that the two men collaborated in the development of their inventions, which were destined to exercise so vast an influence upon naval strategy.

Sir Henry was placed in charge of the wireless equipment of the Navy, and, as Captain Jackson, continued in the control of this important department until, in 1906, he was promoted to the rank of Rear-Admiral. During this period he was successively in command of the torpedo depôt-ship Vulcan, Assistant Director of Torpedoes at the Admiralty, Commander of the battleship Caesar, Captain of the torpedo-

school ship Vernon at Portsmouth, and, finally, Third Sea Lord and Controller of the Navy.

Sir Henry received the Order K.C.V.O. in 1906, and remained at the Admiralty until October, 1908, after which he was in command of the Cruiser Squadron in the Mediterranean for two years. He next represented the Admiralty at the International Conference on Aerial Navigation at Paris in 1910, and a few months later was appointed to command the new Royal Naval War College at Portsmouth. Whilst holding this office he commanded the Seventh Squadron in the Naval manceuvres of 1912. In the follow-

ing year he became Chief of the War Staff at the Admiralty, a post which he occupied practically up to the commencement of the war; had peace prevailed, he would probably have become Commander - in Chief in the Mediterranean.

In 1901 Captain Jackson, as he was then known, was elected a Fellow of the Royal Society on account of his researches into electrical physics, and in 1902 a paper entitled "On some Phenomena affecting the Transmission of Electric Waves over the Surface of Sea and Earth" was pub-lished over his signature in the Proceedings of the Royal Society; in this paper he described a series of experiments which he had carried out on wireless communication between ships equipped with his own apparatus, with a view to ascertaining the screening effect of mountains and hills of intervening between the stations, and the effect of atmospheric changes on the intensity and range of signals. Sir

Elliott & Fry]

ADMIRAL SIR H. B. JACKSON.

[London.

Henry was the first to observe that signals ceased to arrive when high land intervened between two ships, one of which was close to the land in question.

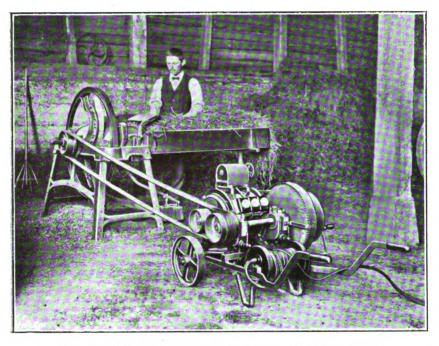

From the brief particulars given above, it will be seen that Sr Henry Jackson is by no means merely an electrician, or an engineer, or a sailor; he is an admirable combination of all three, and is regarded by the Navy as one of the most accomplished officers in that distinguished service. The diversified appointments that he has held, together with years of study of the modern problems of strategy and tactics, and a unique insight into the priceless services that science can perform in the defence of our Empire, render him one of the most able of the many brilliant naval officers of the present day, and should inspire confidence not only in the Navy—which knows him well—but also in the general public, which knows him hard'y at all.

## ELECTRICITY IN FARMING.—I.

FROM time to time attention has been drawn in our columns and elsewhere to the subject of electricity supply for agricultural purposes, more particularly to the developments which have taken place on the Continent and in America, where considerable results on a practical scale have been achieved.

That these results are encouraging and worth following up can be gathered from the data which has been published,

OERLIKON THREE-PHASE TRUCK MOTOR DRIVING CHAFF CUTTEB.

but naturally there are difficulties, and it is not surprising that the limitations of such work should form a subject for discussion in the States. What concerns us most, however, is whether in view of the results obtained abroad there is not scope for similar developments in this country.

A paper by Mr. J. L. White, of the Oregon Power Co.,

which throws some light on the difficulties encountered in Pacific Coast farming districts, points out that the farmer is of the "show me" class, and therefore must be convinced of the economical and practical value of electricity in performing his work before he will spend any great amount of money for its adoption.

This is the real difficulty, and it is probably more pronounced in this country, the supply authorities in farming centres being themselves unconvinced; we only know of one chief engineer who has had sufficient prescience to make a business of supplying local farmers, by means of cheap pole lines, but the question is being considered in several directions.

The author goes on to point out that it

will not pay to make long and costly transmission line extensions solely for the purpose of serving a scattered farm load, although it is equally true that a farming load will pay as a by-product when such extensions already exist or are being made to take care of other classes of business.

The stumbling block is the capital investment, and this has been met in several ways; in some cases the farmers have financed distribution systems, purchasing energy and retailing it amongst themselves, or they

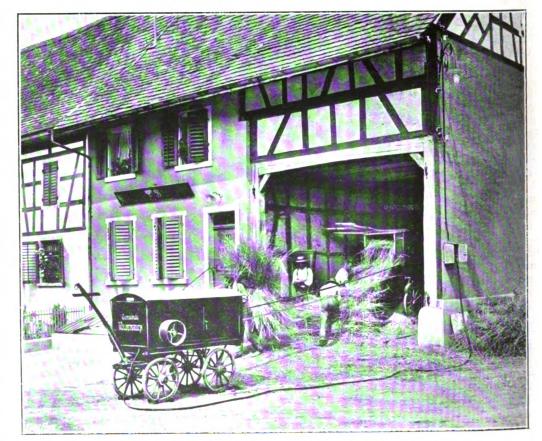

retailing it amongst themselves, or they have paid the whole or part of the cost of the line, or have guaranteed a minimum income to the authority carrying out the work, this guarantee being such that the cost of the line is returned in from one to three years.

In some cases the consumer contributing a proportion of the capital cost has this returned to him if he succeeds in inducing others farmers on his line to take a supply.

Any attempt to deal with farming supply evidently resolves itself into a question of cost of service, and a short article from an American source gives the cost of a mile of rural service line, using poles 200 ft. apart, as follows:—

	Unit	1tem
27 poles (25 ft. high with	price.	cost.
5-in, top)	\$1.15	\$31.05
10,560 ft. No. 8 copper wire	0 16	126 40
27 telephone cross-arms	0.13	3.51
27 through bolts	0.02	1,35
54 locust pins	0.013	0.70
54 insulators (porcelsin)	0 03	1.62
54 square galvanised washers	0.009	0 50
Guy anchors (average)	-	5.00
Labour and hauling	_	7.200
Total field expense for		-
material and labour	-	\$242 23

This includes nothing for supervision, tools, insurance, interest, &z., and the all-in cost is about \$300 (£60) per mile, but the company's initial investment is only one-third of this amount, as the farmers deposit the remainder, subject to its being refunded later in the form of electrical energy. The company requires a minimum of four con-

WAGON MOTOR DRIVING THRASHING MACHINE.

sumers a mile before commencing operations, and at least £7.2 a year is required from them to cover interest and depreciation charges on the mile of line.

The company's farmer customers in a comparatively limited area now number 214; of these 23 have been connected in a year, and the average income from each of them for the first year was £3.5, which was regarded as satisfactory if not profitable, although the supply company's financial charges are also on a reduced scale in the development stage.

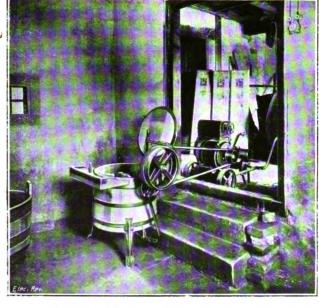

A writer in a recent issue of the General Electric Review gave some statistics as to the electricity used by American and German farmers, which showed that 150 American farms in the central west, averaged 190 acres each, and had an average electrical installation of 35 per cent. lighting and 65 per cent. power. The revenue derived from them was £10 2 per farm, or about  $13\frac{1}{2}$ d. per acre per year.

The statistic include some dairy farms, which are large users of electric power, and the charge for current varied between 2d. and 5d. per unit.

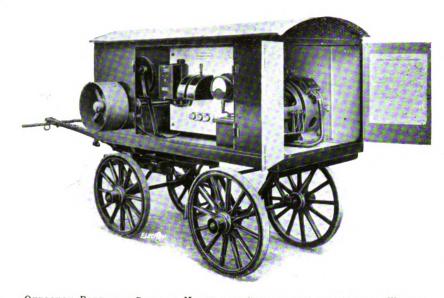

Corresponding German figures for an average 63 acre farm show that lighting and small power applications give a return of about 11d. per acre per year, but these gave only 20 per cent. of the revenue derived, the other 80 per cent., consisting of thrashing, ploughing and traction, bring up the

total yearly revenue per farm to over £16. The prices charged are about 5d. per unit for lighting and  $2\frac{1}{2}d$ . or less per unit for power.

The writer points out that the average farm load-presumably in America -has an excellent diversity factor, and that the peak load comes during the summer months, and is essentially a day load, with the exception of a small amount of lighting. On strictly country lines an appreciable lighting peak is noticed in summer between 4.30 and

PORTABLE MOTOR DRIVING CHURN.

OERLIKON PORTABLE DRIVING MOTOR AND SWITCHGEAR, MOUNTED ON WAGON.

5.30 a.m., and in winter between 5 and 7 a.m., while very little lighting used in the evening.

The amount of power likely to be required per farm appears to vary within wide limits; three cattle breeders, for instance, head the list with an average of  $17\frac{1}{2}$  KW. per farm, and use 30 units per kw. installed per month.

Two classes of dairy farms average 7 and  $10\frac{1}{2}$  KW., and use 31 and  $9\frac{1}{2}$ units per kw. per month respectively -the former high figure being due to

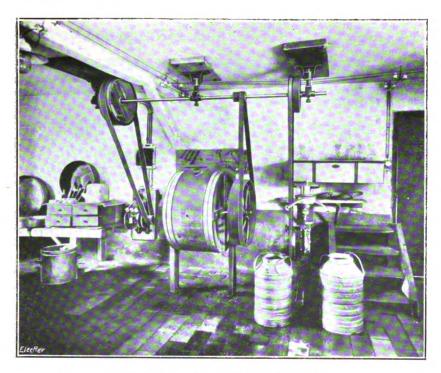

the use of cold storage and milking machines and cream separators.

An average small motor and lighting farm requires some 2.6 kw. of plant, and uses 15.8 units per Kw. installed per month; while the market gardener averages some 2 kw. of plant and 19 units per kw. per month, principally for pumping operations.

The writer's concluding advice, that if such farm lines can be built now to give only a small return, they should be constructed in order to forestall the isolated plant, which is hard to displace if once installed, is equally applicable to this country, where small petrol and oil engines are being adopted in large numbers by farmers.

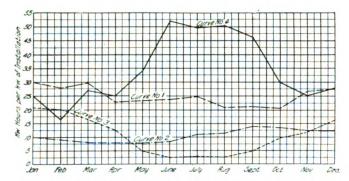

The question naturally occurs as to whether such data as that given is applicable to farming in this country; in fact, whether the average British farm can be compared to an average American farm of the class referred to by the writer.

In point of size, it is interesting to note that a *Times* article on British farming of a year or two back stated that the greater part of the land of the

FIXED MOTOR PRIVING DAIRY MACHINERY.

country is held by men occupying single farms of from 150 to 500 acres, which compares sufficiently well with

Curve 1, lighting, irrigation, and general farming: Curve 2, lighting; Curve 3, huskers, shredders and feed grinders; Curve 4, pumping and refrigeration.

CURVES SHOWING COMPARATIVE CURRENT CONSUMPTION OF FOUR PRINCIPAL TYPES OF AMERICAN FARM LOADS,

the average of 190 acres given for the American farms. The article proceeded to point out that America and the

INTERIOR OF ELECTRIC AMBULANCE FOR DURBAN (see p. 799).

Colonies, so often quoted as examples of modern farming, had nothing to teach us, from which we may infer that

our farming community is sufficiently progressive to adopt electric light and power if it is brought within its reach on competitive terms, especially in view of the necessity nowadays of economising in manual labour.

The position of the farmer in regard to motive power on the land was indicated by one of them in an article in the World's Work, who thought there would be a great opening in the future for it, and pointed out that farmers said they would have farm motors if they were cheaper, while the manufacturers replied that they could easily make them cheaper if more were bought.

The oil-engine builders are fully alive to the possibilities of farm business, and some of their booklets demonstrating the farm uses of the oil-engine should convey a hint to electrical people in this country, who do not appear to have studied the problem.

On the Continent electrical firms have designed special equipment to meet the requirements of the agriculturalist, and through the courtesy of the Oerlikon Co. we are able to illustrate some Swiss farming applications in which it will be noted that portable types of apparatus are employed. These are constructed with either direct or alternating-current motors, in the smaller powers on two-wheeled hand trolleys, while heavier motors are mounted on four-wheeled trucks.

A typical outfit of the smaller class includes a motor geared to a second motion shaft having different sized pulleys at either end, in addition to a pulley on the high-speed motor shaft.

The gear ratio of the spindles is usually 5 to 1, and the arrangement gives pulley sizes and speeds to suit most

THE LATE HARRY GUSTAV BYNG Sec. Lt. 2nd Border Regiment (see p. 799.)

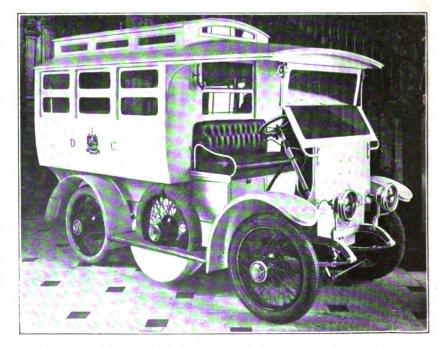

requirements. A starter and fuses are mounted on the motor frame and coupled to a cable drum on the trolley, carrying some 10 m. of cable fitted with a suitable end connector for coupling to the supply mains.

A portable 4-HP. three-phase motor equipment of this kind would cost about £30; no fixing is required for driving purposes, the weight of the apparatus being sufficient to retain it in position.

Larger apparatus, of more elaborate design but similar in principle, is utilised for driving thrashing machinery.

In this case the motor, switches, cable, drum, &c., with 100 m. of cable, are carried in a sheet-iron van, from the sides of which the driving pulleys project.

The simple squirrel cage motor is favoured for this class

ELECTRIC AMBULANCE SUPPLIED TO DURBAN CORPORATION, SOUTH AFRICA (-ee p. 799).

Digitized by Google

of work, and by the use of star-delta starters, and fast and loose pulleys for the larger motors, line disturbances at starting can be avoided.

An American instance of the use of similar apparatus was described in the *Electrical World*; in this case the farmers in a district combined to purchase an electric set for thrashing purposes, consisting of a 2,200/220-volt transformer, 30-H.P. single-phase motor and switches, mounted on a steel-frame truck, at one end of which a temporary ladder pole is placed to carry the 2,200-volt lines. This outfit cost some £200, and it is reported that the farmers' league saved 25 per cent. by using it in place of steam tackle.

In this country farms in the vicinity of towns, where manual labour costs probably 20 per cent. more than in the more remote districts, should present little difficulty to the tactful electric supplier, especially if portable apparatus such as that referred to can be hired out on similar terms to those with which the farmers are familiar for other plant.

## THE LATE HARRY GUSTAV BYNG.

THE war has robbed the electrical industry of one of its most promising sons by the loss of Second Lieut, Harry Gustav Byng. He was the third son of the late Gustav Byng (founder and late chairman of the General Electric Co., Ltd.) and Mrs. Byng, of 32, Bryanston Square, W. He was born in July, 1889, and educated at Harrow, where he was captain of the school gymnasium eight, monitor and head of his house, for which he played both cricket and football; he also played for the Harrow Association football team. After leaving Harrow he joined Faraday House, and was awarded the silver medal in his year. He then completed his education at Harvard University, where he distinguished himself by passing all his examinations He enjoyed extraordinary popularity, with honours. both socially and as a good sportsman. He was captain of the Harvard Association Football XI. When leaving Harvard he joined an exploring expedition into the lesser-known parts of Canada, and after a short return home joined the General Electric Co., of Schenectady, as a pupil. He distinguished himself in the test room and was on the fair road to success, when his duty towards his family called him back in order to take part in the work of the General Electric Co., Ltd. He settled in Warwickshire so as to live near the works at Witton, and was on the point of assuming a position of responsibility when war broke out. His sense of duty to his country made him join His Majesty's Forces during the first week. He trained with the Artists Rifles and went to France with them at the end of September, returning home on March 21st on five days' leave, during which time he married Miss Evelyn Curtis, of Boston and Beverley Farms, Mass., U.S.A. Immediately after he was gazetted 2nd Lieutenant of the Second Border Regiment and fell in battle on May 16th, near Festubert, in France, whilst leading his platoon. His Commanding Officer wrote:

Mr. Byng was wounded whilst most gallantly leading his platoon in action on May 16th. He was universally popular in the regiment. He had done very good work reconnoiting the enemy's trenches, and his loss is very great to the battalion.

The Adjutant of his regiment wrote:-

He was shot whilst leading his men, and fell actually on the enemy's trenches. He lay quite uncomplaining, and would not allow any of his men to carry him back, because of the danger to their lives.

Those who knew the late Mr. Byng will remember him as a young man of exceptional promise and charm. His death comes as a great personal loss to his family, to whom we tender our deep sympathy, and to his many friends in electrical and other circles.

# CARTER ELECTRIC AMBULANCE FOR DURBAN.

WE illustrate on page 798 an electrical motor ambulance recently supplied by Messrs. Carters, the ambulance specialists, of New Cavendish Street, W., for the Corporation of Durban, South Africa. While the makers have proceeded on definite and well-known lines in regard to the chassis, the mounting of the vehicle and the design of body with the interior accommodation are quite new and offer many advantages. The chassis is of a type identical with two of those now in use in the City of London, fitted with Greenwood & Batley 8-H.P. twin motor and Tudor Ky. B. 9 type battery; the controller gives six speeds forward, reverse, and electric brake, and, in addition, hand and foot brakes are provided. The chassis runs on Rudge-Whitworth steel detachable pneumatic-tired wheels. The body of the car is of teak throughout; the interior is lined with aluminium, and finished like the exterior in white Ripolin. Special ventilation is obtained by the adoption of a lantern roof with opening glass frames, window fasteners to the main window frames, and glass louvred windows in metal frames in the front end and the door. The car is intended for general use in Durban and provides accommodation for twoinvalids or injured; the stretchers are fitted with Carters' patent extension gear and a number of accessories are provided.

This is, we understand, the first electrical motor ambulance to be used in South Africa, and in view of its excellent features, it is quite safe to predict that other municipalities will follow the example set by Durban.

#### REVIEWS.

Polyphuse Currents. By ALFRED STILL. Second edition, ravised. London: Whittaker & Co. Price 6s. net.

The many friends of the first edition of this little book will be glad to see that its success has led to the issue of a new edition, which will, in its turn, make new friends.

The edition before us does not differ in essentials from its predecessor, but the contents have been to some extent rearranged and rewritten, while the diagrams have been mostly redrawn in order to make them agree with the International Convention regarding the direction of rotation of alternating vectors. The symbols have also been brought into agreement with the present standard conventions.

It is assumed that the reader has a fair knowledge of continuous currents, but that he comes to the study of the book without any knowledge of alternating currents. The book consists, in fact, of an introductory study of the principles of alternating currents, so far as this can be undertaken by the application of graphical methods depend-

ing on the use of the simple vector diagram.

Questions of construction and design are wisely left aside for treatment in books devoted to this side of the subject, while the author confines his discussion to the main underlying principles of the generation, transmission and conversion of alternating currents. The experimental aspect of the subject is also left almost entirely on one side for treatment elsewhere. The author's treatment is simple, clear and effective, while he displays high qualities as a teacher and evidence of painstaking thoroughness in his work. Throughout, the method of analysis is non-mathematical and based almost entirely on graphical constructions; but in several directions (for instance, in dealing with unbalanced loads) the author shows how the simple vector diagram may be extended beyond the limits of application usually assigned to it in elementary text-books.

It will be gathered from what has been said that the book is not a general text-book, but rather an introduction to the study of alternating currents confined to one aspect of that subject. Within these modest limits the book is quite excellent, and can be cordially commended to the

student.

Polyphase induction motors come within the scope of treatment, and the simpler forms of circle diagrams are

clearly given, although these are not developed into the forms which are usual in commercial practice. Some space is occupied in explaining the principle of the polyphase compensated motor provided with a commutator. It seems a pity that the author did not extend this treatment to include some of the better known forms of single-phase motor having a commutator. Perhaps this would have taken him too far—at all events, he has omitted all discussion of single-phase motors, whether with or without commutators.

Frequency converters, rotary converters and motor-converters are treated in a simple and interesting way in a chapter which begins by showing the development of the asynchronous generator from the polyphase induction motor.

Electric Bells, Alarms and Signalling Systems. By H. G. WHITE. London: Rentell & Co. Price 1s. 6d. net.

As indicated by its title, this book deals chiefly with electric bell, alarm and signalling applications and systems. Circuits for every bell and indicator application of any importance are represented by clear diagrams; but mechanical details of apparatus are described no more than is necessary to explain their use. By adhering rigidly to this very reasonable limitation of scope, the author is able to give in small compass an exceptionally useful treatment of his subject, and this work should certainly be in the hands of every practical man engaged in bell and indicator work or interested in their installation, as well as every student of the subject. Bells and indicators are not so simple as they seem, particularly in respect of their connection for special purposes, and endless trouble is frequently occasioned by neglecting to study this subject properly.

Chapter I is devoted to simple bell circuits and includes useful notes on selection of bell resistance, transformers and reductors for high-voltage circuits. Chapter II deals with indicator systems and is exceptionally useful; a study of the information and diagrams presented should go far to remove the vagaries and troubles so frequently experienced in indi-A comprehensive treatment of the cator installations. general principles of fire-alarm systems and of open and closed circuit burglar alarms is presented in Chapter III, the connections of private alarms and public call systems being included. Fault localising and points to be observed in wiring form the subject matter of a short but very valuable chapter, and, by including a chapter on mine signalling systems, the author has greatly increased the value of the book while extending the range of its readers. The bearing of Home Office Regulations on this branch of signalling is kept well to the fore. The work is indexed thoroughly and constitutes excellent value for money.

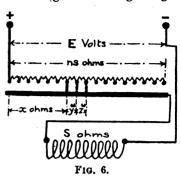

# SOME NOTES ON SHUNT REGULATING RESISTANCES.

BY THOMAS CARTER.

(Concluded from page 753.)

HII. A Special Grading for Ordinary Regulators.—
While in very many cases of shunt regulation by the ordinary method, the standard connections for which are shown in fig. 6, the successive steps of resistance can be determined to suit some specified condition of regulation without reference to anything else, it is necessary in an increasing number of cases to consider the question of sparking between contacts as the resistance is introduced into circuit. The use of motors with increasingly great speed ranges on high-voltage circuits means that, with more volts to be absorbed in the regulator, the volts between contacts tend to increase in consequence of modern practice. The point at which sparking begins varies with many conditions, such as the amount of current dealt with, the shape of the contacts and their material, and the nature of the sliding contact. Once more experience alone indicates the correct conditions. It may be permissible to allow more volts

between contacts at the low-current end of a regulator than at the high-current end; but, at any rate, as a starting point, it is useful to get out the grading for equal volta

between contacts. The conditions upon which this depends will now be investigated.

The exciting voltage, E, has across it the field winding, whose resistance is s ohms, and a part x, of the regulator, whose total resistance is n s ohms. Suppose the resistances of the next two sections to be introduced to be y ohms and z ohms respectively. Also let e be the voltage between contacts on introducing any step of resistance, e being constant. Then—

$$e/E = z/(s + x + y + z) = y/(s + x + y)$$
.  
Hence, by the ordinary rules of ratios,

$$e/E = (z - y)/\{(s + x + y + z) - (s + x + y)\} = (z - y)/z = 1 - y/z, \text{ or } y/z = 1 - e/E.$$

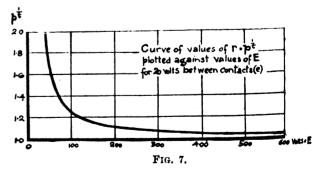

Thus if e is constant y/z must be constant, and therefore also (s + x + y)/(s + x + y + z), which from the shore is equal to y/z, must also be constant and equal to 1 - e/e. That is to say, the resistance must be graded so that the successive totals between terminals, of field plus regulator resistance, form a geometric series. Let r be the ratio of this series. Let the ratio of maximum to minimum shout current, determined experimentally as in Section II, be p. Then clearly p = n + 1, since the maximum shout current is E/s and the minimum is E/s (n + 1) = E/p by definition. The value of n is, therefore, in this case also experimental.

experimental.

The first term of the series is s, and the last is s (n + 1). Let there be t terms, or steps of resistance. Then—

$$r = \{s (n + 1)/s\}^{-1} = (n + 1)^{-1} = p^{-1}$$

It has already been shown that e/E = 1 - y/z. Now y/z = (s + x + y)/(s + x + y + z) = 1/r, and hence  $e/E = 1 - 1/r = 1 - 1/p^{\frac{1}{\epsilon}} = (p^{\frac{1}{\epsilon}} - 1)/p^{\frac{1}{\epsilon}}$ , or  $E/e = p^{\frac{1}{\epsilon}}(p^{\frac{1}{\epsilon}} - 1)$ , which can be put into the form  $(E/e^{-1})/(p^{\frac{1}{\epsilon}} - 1) = 1$ , which is a rectangular hyperbola with

asymptotes E/e = 1 and  $p^{\frac{1}{\ell}} = 1$ . A simpler form of the same expression is obtained thus:

$$1/p^{\frac{1}{t}} = 1 - e/E = (E - e)/E$$
, or  $p^{\frac{1}{t}} = E/(E - e) = f$ . This gives a relation between  $p$ , which is determined by the design of the machine and the conditions to be fulfilled;  $t$ , the number of steps in the regulator, which is to be determined;  $E$ , the exciting voltage, which is known; and  $e$ , which is fixed from experience.

Consider now a definite case on general lines. Take at 20 volts. Then a curve can be plotted, as shown in fig. 7.

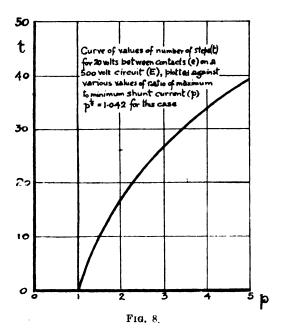

showing the relation between the ratio r, or  $p^{\frac{1}{t}}$ , of the geometric series, and the line voltage E. The curve is plotted from the following values, derived from the ex-

pression 
$$r = p^{\frac{1}{t}} = E/(E - e) :$$

E... ... 40 70 100 200 300 400 500 600 E - e ... 20 50 80 180 280 380 480 580  $r = p^{\frac{1}{t}} = E/(E - e)$  200 140 125 111 1072 1052 1042 1035

Other curves could be plotted on the same chart for different values of e, and these would at once give the ratio of the geometric series necessary, at any value of E, to limit e to any desired amount. It is clear, then, that for a given

value of E, the value of  $p^{\frac{1}{4}}$  is constant for a definite value of e. It now remains to investigate the relation between

t and p as p increases in value. As an example, do this for a 500-volt circuit, for which it has already been shown that for e=20,  $r=p^{\frac{1}{4}}$  must have the value 1.042. If  $p^{\frac{1}{4}}=$ 1.042, then clearly  $t = \log \rho/\log 1.042$ , and the following relation is obtained :-

The curve shown in fig. 8 gives the relation between p and t graphically, and shows how, for a 500-volt circuit, the number of steps of resistance required to limit the volts between contacts to 20 increases as the ratio of maximum to minimum shunt currents increases. A set of curves like this would enable the number of steps necessary for any given case to be read off at once. Or, if the dangerous point is not frequently reached, the value of / for any specified condition is readily calculable from the simple

expression  $p^{\frac{1}{t}} = E'(E - e)$ , which, solved generally for t, becomes  $t = \log p \log E/(E - e)$ .

The case considered in this section is one which can be most conveniently dealt with by a set of symbols in the shape of a formula rather than by a set of curves; the curves have been illustrated, however, to show the general shape assumed by the variables entering into the calculation, and there might be cases where a set of curves on the lines indicated would be useful in no small degree.

It is scarcely necessary to mention that in all problems connected with geometric series, in which the extraction of a root such as, say, the 36th or the 50th, is involved, the use of a log-o-log scale on a slide rule is of the greatest possible value as a time saver. There are several of these on the market; the writer has his own favourite, while others, no doubt, prefer other types. But the principle embodied in such slide rules enormously increases their range of usefulness.

In the setting-out of the calculation of a resistance with geometric grading, successive totals between terminals are obtained as the terms of the series, beginning with s and

ending with (n + 1) s = p s. Successive steps are then obviously obtained as the differences between the successive totals so found, and the current capacities at each step are found by dividing E by the total between terminals up to and including the step considered.

#### NOTES.

(Continued from page 791.)

Fatalities,-In the Stirling Sheriff Court last week Sheriff Moffat and a jury held an inquiry into the death of John Sheriff Moffat and a jury held an inquiry into the death of John Stirling, coal-cutting machineman, Haggs, who was fatally injured in No. 3 Broomrigg Pit, Dennyloanhead, belonging to the Banknock Coal Co., on April 19th. David Todd, certificated colliery manager, Dennyloanhead, and William McCallum, chief electrical engineer to the Banknock Coal Co., were warned that, in view of possible future proceedings, they need not answer questions which might appear to prejudice them. Sheriff Moffat, in addressing the jury at the close of the inquiry, said it was quite apparent from the medical evidence that all the appearances were consistent with death resulting from electric shock, and there was quite clear evidence that at the time of the accident deceased was grasping a highly-charged electric coal-outting machine which was in a defecdeath resulting from electric shock, and there was quite clear evidence that at the time of the accident deceased was grasping a highly-charged electric coal-outting machine which was in a defective condition. The chief electrician (McCallum), who was a most reliable witness, said the machine was defective owing to the nonuse of the bolt, which caused the connection of the cable not to be tight. This, in turn, brought about the leakage of electricity into the frame of the machine, and naturally was the cause of death. The fact that the coal-cutter became alive might also be due to the defective state of the leads through the body of the machine. He did not think any fault or negligence could be attached to Mr. David Todd, the manager. He was not an electrician and did not examine the machine. Then it was quite apparent it was not Mr. McCallum's duty personally to examine the coal-cutter, as he stood more or less in the light of an adviser to the company. It was unfortunate that McCann, who was the electrical engineer at the pit, had been absent from the inquiry, and that the principal person who had had the supervision of the machine had not had an opportunity to give evidence. In the circumstances it would not be proper to say that any particular individual was at fault, but, they could say that the coal-cutter itself was faulty. The jury returned a verdict that the socident occurred through the faulty condition of the machine, caused by want of proper insulation. The jury added a rider to the effect that there seemed to have been some negligence, but they did not feel called upon to lay the blame of that negligence at the door of any narticular person. upon to lay the blame of that negligence at the door of any

particular person.

A boy of seven received a fatal electric shock on May 27th while

Volk's electric railway at Brighton. The inquest trespassing on Volk's electric railway at Brighton, was adjourned for expert evidence.

Newfoundland.—Mr. T. L. Wilson, formerly of Ottawa, has made registration at St. John's, Newfoundland, of a company with a capital of \$20,000,000, to develop electrical energy in that Colony for the manufacture of nitrogenous fertilisers from the nitrogen of the atmosphere,

Penalty for Exporting Carbons.—At East Ham on Wednesday, according to the Standard, Messrs. Duncan Macneill and Co., Winchester House, Old Broad Street, E.C., were fined £5 and £3, together with £10 10s. costs, on two informations for failing to comply with the provisions of the Customs and Inland Revenue Act, and failing to comply with the orders of the Customs Consolidation Act. Mr. Cecil Simpson, who prosecuted for the Customs and Excise, said the first offence was that the defendants cent to the Royal Albert Dock two cases of searchlight carbons Customs and Excise, said the first offence was that the defendants sent to the Royal Albert Dock two cases of searchlight carbons which were supplied by an electrical company. The goods were prohibited for export by Royal proclamation. The second offence was for not making a proper entry with the Customs before shipment. The goods were to be used by a navigation company on rivers in India. Mr. Basil Watson, for the defence, admitted the charges, and said the goods were only valued at £25. An apology was offered was offered.

Cab - Signalling Needed. — Lieutenant-Colonel von Donop in his report to the Board of Trade on the derailment of a Midland Railway express passenger train from York to Sheffield at Chaloner Whin Junction, York, on the North-Eastern Railway on March 28th, states that it was another instance of an accident mainly due to a driver not noticing that his distant signal was at danger.

Electrical Trade in Hong-Kong.—We learn that the opportunity for the introduction of cheaper grades of electrical supplies in the Hong-Kong field growing out of the closing of the trade to German manufacturers as a result of the war, is being taken advantage of by Japanese manufacturers, and many lines of electrical goods are going into the market from that country. There are three well-equipped factories for such goods in Japan, according to Hong-Kong importers concerned in this trade, and all of them have carried on an active campaign in behalf of their goods, which include practically all lines of ordinary electrical supplies, aside from electrical machinery, and the finer grades of electrical apparatus.—Eastern Engineering.

Educational. — Northampton Polytechnic Insti-TUTE (LONDON).—A free scholarship, of the value of £30, open to all comers, is being offered to students of optics, in which the chances have been greatly enlarged by the shutting-off of alien supplies due to the war. Particulars can be had from the hon. secretary and treasurer, Mr. Henry F. Purser, 35, Charles Street, Hatton Garden, London, E.C.

Institution and Lecture Notes.—Junior Institution of Engineers. - A lecture was recently given on Diesel engines,

by Mr. W. A. Tock y.

Institution of Electrical Engineers.—The report of the
Committee of the Newcastle Local Section, presented at the annual general meeting on May 17th, shows a decrease in membership, mainly in the Students' Section, the total now being 261.

The growing importance of the Tees-side sub-section is clearly The growing importance of the Tees-side sub-section is clearly shown in the report. The following were nominated and have been duly elected as efficers and committee for next Session:—Chairman, Mr. P. V. Hunter; vice-chairmen, Messrs. H. W. Clothier and A. H. Marshall; Committee, Messrs. E. Fawssett, G. L. Porter, W. F. T. Pinkney, H. S. Ellis, C. Turnbull, W. G. Guns, T. Carter, M. G. S. Swallow, C. S. Vesey Brown, R. W. Gregory, J. B. Beard, G. L. Drury, H. Henderson, Dr. W. M. Thornton, Messrs. F. O. Hunt, A. P. Pyne, J. R. M. Ellistt, and W. Cross; Hon. Treasurer, Mr. C. Vernier; Hon. Secretary, Mr. J. R. Andrews. Mr. J. R. Andrews.

Volunteer Notes .- 3rd Batt. (OLD BOYS) CENTRAL LONDON REGIMENT (VOLUNTEERS).—This is a voluntary organisation, consisting of Old Public School and 'Varsity men and their friends, and is affiliated to the Central Association of Volunteer Training Corps. Drills take place every evening in Regent's Park and other centres, and a week-end camp is held at Wembley Park, N.W. An O.T.C. Class is also held at Lord's Cricket Ground, N.W., for men desirous of obtaining commissions. Over 350 have already obtained them through the Cours' internations. obtained them through the Corps' instructions. A large number of electrical men are members of the Corps. Men wishing to join the Corps should send in their applications immediately to the Hon. Secretary, 205, Oxford Street, W.

BATTALION ORDERS BY COLONEL S. G. GRANT (OFFICER COMMANDING).—Week-End Paradéé.

Saturday:—The Battalion will parade at Baker Street Metropolitan Station at 2.30 p.m. "C" Company, under the command of Captain R. J. C. Estwood, will proceed direct to Wembley Park and take up a defensive position to meet an attack coming from the south-easterly direction. "A," "B" and "D" Companies, under the command of Mr. H. O. King, will detrain at Neasden and attack the camp at Wembley. Route to be followed will be communicated later. later.

Sunday: —7 a.m. -7 acm. Reveille. 10.20 a.m. Companies' Parade. 2.15 p.m. Battalion Parade. 10.20 a.m.

The Quartermaster has made arrangements for serving tea to friends of members, on Sunday next. Price 6d. each. Tea will be served between 4 o'clock and 5.30 p.m. in the marquee set aside for the purpose. . . A. G. JOINER, Captain and Adjutant.

Late Legal.—ADNIL ELECTRIC Co., LTD., v. BRITISH TRADERS' ASSOCIATION.—By, a majority the Court of Appeal on Wednesday dismissed an appeal by the Adnil Electric Co., Ltd., from orders by Mr. Justice Ridley staying actions brought by them against the British Traders' Association for money had and received, and against Andcole & Turner, Ltd., for goods supplied. It appeared that in 1909 the plaintiff company was formed to take over the business previously carried on by Marples & Leach, Ltd. The shareholders were mainly German, and Mr. Marples and Mr. Leach were appointed joint managers. Solicitors were also The shareholders were mainly German, and Mr. Marples and Mr. Leach were appointed joint managers. Solicitors were also appointed. The British Traders' Association were a debt collecting agency who obtained judgment against a debtor in the name of the plaintiff company. In respect of that judgment this action was brought. The action against Andcole and Turner was for goods supplied. The question was whether the solicitors acting for the company had authority to bring the action. They had been instructed by Mr. Marples and Mr. Leach, but since the war broke out had received no particular instructions from the directors. There were three directors—a Dutchman and a German, both resident in Germany, and an Englishman who was interned there. Mr. Gore Browne, K.C., for the company, sub-mitted that there was authority to bring the action. Lord Justice Swinfen Eady said he agreed with Mr. Justice Ridley in that the evidence did not satisfy him that Marples & Leach had authority evidence did not satisfy him that Marples & Leach had authority to bring those actions. Lord Justice Phillimore assented. Lord Justice Bankes concurred with Lord Justice Swinfen Eady. The appeals were, therefore, dismissed.

CITY AND SOUTH LONDON RAILWAY CO. v. H.M. POSTMASTER-GENERAL.—A special case stated in this action to determine questions as to the right of laying telegraph and telephone wires, was before Mr. Justice Neville in the Chancery Division on Wednesday. Mr. Harmann, representing the plaintiffs, stated that the matter was somewhat complicated, but there was a prospect of a settlement. Under these circumstances, he asked, with the consent of the defendants, that the case might stand over, with liberty to restore it to the list for hearing on seven days notice. His Lord-ship allowed that course to be adopted, and the case stood over generally as arranged,

The King's Birthday Honours.—The List of Honours which appears just as we go to Press with the last page of this issue, contains the following announcements that will -The List of interest our readers :-

Upon Sir Henry Norman a baronetcy is conferred.

The honour of knighthood is conferred upon Lieut.-Col. Wm.
Forbes, general manager of the Brighton Railway; Edward Rigg, Esq., C.B., Superintendent of the Operative Department of the Boyal Mint; and W. Slingo, Esq., Engineer-in-Chief of the Ganeral Post Office. Post Office.

Mr. David Mitchell Stewart, Superintending Engineer, General

Post Offica, is appointed to the Imperial Service Order.

To all these gentlemen the ELECTRICAL REVIEW tenders its congratulations. An account of the career of Mr. Slingo appeared in our pages at the time of his appointment to succeed Major O'Meara as Engineer-in-Chief (ELEC. REV., March 8th, 1912).

Fire Prevention.—The British Fire Prevention Committee has issued a "Warning" circular (No. 16) for factories and works engaged on Government and war emergency supplies, containing useful advice as to the precautions that should be taken to prevent the outbreak of fire, of which the risks are increased at a times of high pressure and all-night working. Copies can be obtained free on application to the Committee at 8, Waterloo Blace Bull Mail Say. Place, Pall Mall, S.W.

Appointments Vacant.—Switchmen (30s.) for Newport electricity department; assistant electrical engineer (£150), for Government of Malts.

Electric Vehicle Costs.-In a recent issue, our con-Electric Vehicle Costs.—In a recent issue, our contemporary, the Commercial Motor, gave some particulars of the electric vans employed by Messra. J. Lyons & Co., Ltd., the well-known caterera. These comprise one G. V. and seven Edison visibles, and for four weeks ended April 16th, for two 4-ton vehicles the average current cost per mile was '45d. on a mileage of 222'3; for two 2-ton vehicles the average cost of energy per mile was '73l. on 192'1 miles; for one 5-ton vehicle the average cost of current per mile was 1'3d. on a mileage of 195'2. One Edison 4-ton and one Edison 2-ton vehicles have each run over 7,000 miles between November, 1914, and May, 1915, while the other five Edisons, each covered between 3,000 and 5,000 miles in that time. While the initial outlay is greater. Messra. Lyons that time. While the initial outlay is greater, Mesers. Lyons find the working cost of the electric compares very favourably with their petrol vehicles, and they intend to extend their "electric" fleet.

Anti-Aircraft Appliances.—A County Council report mentions that a new motor "emergency tender" has been put into commission. This appliance carries a number of smoke helmets, and, in addition, is fitted with a dynamo, partable searchlights, and an electric blower for forcing air into places where dense smoke or poisonous gases exist. It is manned by specially selected fremen, who devote considerable time to maintaining the apparatus and training and practising therewith,—Nandard.

## OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials. — The newly constituted Spenborough U.D.C. has decided to retain MR. ALBERT PICKERSGILL

Spenborough U.D.C. has decided to retain MR. ALBERT PICKERSGILL as electrical engineer, at the same salary and on the same conditions as hitherto attached to the appointment.

MR. E. BROAD has been promoted to the position of shift engineer at the electricity works of the Heston and Isleworth U.D.C., taking the place of Mr. J. Fletcher, who has been appointed station superintendent at Worksop.

Derby Corporation E.L. Committee recommends that the salary of MR. A. THOMSON, charge engineer, be increased from £2 7a. per week to £130 per annum.

per week to £130 per annum.

Tramway Officials.-Mr. W. Tuke Robson, late manager of the South Shields Corporation tramways, who proceeds manager of the South Shields Corporation tramways, who proceeds to take up a similar appointment at Southampton, has been presented by the staff and employes with a framed photograph of the donors, and a wardrobe made from timber taken from the old man-of-war Royal Albert, which was broken up 25 years ago.

Halifax Tramways Committee has recommended the T.C. to increase the salary of Mr. J. D. CAIRD, traffic manager, from £350 to £375 per annum, with a further increase to £400 a year hence.

General.—As from June 1st, Mr. James Fleming, treasurer to the gas and the electricity departments of the Glasgow Corporation is retiring, and the electricity departments of the Glasgow Corporation is retiring, and the Corporation has agreed that in future the finances of the two departments concerned shall be handed over to the control of the respective managers, Mr. W. Lackie, chief engineer and manager of the electricity department, and Mr. Alexander Wilson, engineer and manager of the gas department. This arrangement will put the electricity and gas departments of the Glasgow Corporation on the manager of gas departments of the Glasgow Corporation on the same self-

ontained footing as the Glasgow Tramways Department.

MR. NEEDHAM, acting first assistant electrical engineer at
Dover Admiralty Works, has been appointed first assistant electrical
engineer at the Bermuda Dockyard. He is succeeded at Dover by
MR. J. W. CHURCH, late of Malta.

The marriage took place at Askern (Yorks.) Parish Church, on May 24th, of ME. DAVID ROSSEE, electrical engineer, late of Askern, now of South Wales, and Miss E. Silmer Richardson, sixth daughter of Mr. John Richardson, of Moss Road, Askern.

MR. HABOLD W. JACKSON, of the electric telegraph branch of the chief mechanical engineer's department, Lancashire and Yorkshire Railway station, Bolton, has obtained an appointment in the electrical department of the Cape to Cairo Railway, and last week he was made the recipient of numerous gifts from his late col-leagues on the Lancashire and Yorkshire Railway. Mr. J. H. Runnett made the presentations.

Mr. MARCONI has recently returned to this country from America, and he will almost immediately proceed to Italy to take control of the organisation of the wireless telegraph service of the country.

Mr. A. S. Marks has resigned his position with Mesers. Veritys, Ltd., to become London and South of England representative for Messrs, Ingram & Kemp and Messrs, Sperryn & Co., Ltd. All correspondence should be addressed to his headquarters at 26 and 27, Hatton Garden, E.C.

MR. G. STANLEY WHITE, of the firm of Messrs. George White and Co., Bristol, has been elected a director of the Bristol Tramways and Carriage Co., Ltd., in the place of the late Mr. Hugh G. Doggett. MB. SAMUEL WHITE relinquishes the position of managing director owing to ill-health, but remains on the board. MB. W. G. VEBDON SMITH has been appointed managing director. MB. J. H. HOWELL, J.P., has been appointed a director of the Imperial Tramways Co., Ltd., in place of the late Mr. H. G. Doggett.

Obituary.—Amongst the victims in the Gretna Green railway disaster was MR. HERBERT HENRY FORD, manager of the orane department of Mesers. Arroll, of Glasgow. He was 45 years of age, and belonged to Bath, where he was at one time with Mesers. Stothert & Pitt.

MR. W. GORDON, traffic manager of Dublin United Tramways MR. W. GORDON, traffic manager of Dublin United Tramways Co., was seized with illness while out riding his horse on May 27th. Mr. Gordon was apparently in his usual health on the Thursday morning last week when he set out on his tour of inspection of the depôts. He was on horseback and was attended by a groom. While passing through Herbert Park he suddenly swayed. The groom tried to prevent his falling, but he did not succeed, and the unfortunate gentleman reached the ground with a thud and expired immediately. Deceased, who was a native of London, had reached his 68th year. He had a wide experience in tramway management in England and on the Continent before his appointment to Dublin in 1899. Mr. Gordon was very popular with the various staffs and with the general public. public

The secretary of the Dublin United Tramways Co., MR. R. S. TRESILIAN has also passed away very suddenly. He had arranged for a holiday in the South of Ireland, but his state of health necessitated an operation in hospital. When this had been performed, it was thought that he would go on satisfactorily. Two days later, however, he collapsed. Mr. Tresilian was just over 60 years of age. over 60 years of age.

Wills,-Mr. F. W. LAWSON, a director of Fairbairn, Lawson, Combe Barbour, Ltd., left £128,033 gross and £106,796 net personalty.

The late Ds. S. G. RAWSON, Principal of Battersea Polytechnic, and chairman of the Council of the Association of Technical Institutions, left £4,237.

The late MR. THOMAS BULLOUGH, a director of Howard and Bullough, Ltd., left £704,634 gross and £697,128 net personalty.

## NEW COMPANIES REGISTERED.

Poulsen Wireless Telegraph Co., Ltd. (140,494).—Registered May 28th, by Steadman, Van Praagh & Gaylor, 4, Suffolk Street, Pall Mall East, S.W. Capital, £450,000 in £1 shares. Objects: to carry on the business of electricians, manufacturers, generators, accumulators, suppliers and distributors of electricity and electrical energy for telegraphic, telephonic, lighting heating and other purposes, telegraphists, telephonists, proprietors and exchanges, etc., and to adopt an agreement with the British & Overseas Engineering Syndicate, Ltd. The signatories (with one share each) are: F. S. Gaylor, 4, Suffolk Street, Pall Mall East, S.W., solicitor; A. W. Urquhart, 4, Suffolk Street, Pall Mall East, S.W., solicitor; A. W. Urquhart, 4, Suffolk Street, Pall Mall East, S.W., clerk; G. Humphries, 4, Suffolk Street, Pall Mall East, S.W., clerk; S. F. Layzell, 20, Ventnor Road, New Cross, S.E., clerk; W. B. Pearson, 4, Suffolk Street, Pall Mall East, S.W., solicitor's managing clerk. Holding, 17, Herbert Road, Wimbledon, S.W., solicitor's managing clerk. Holding, 17, Herbert Road, Wimbledon, S.W., clerk. Minimum cash subscription, seven shares. The first directors (to number not less than two or more than six) are: Sir Leigh Hoskyns, Bt., Cotefield, Banbury, Oxon; A. Davidson, 23, Upper Thames Street, E.C.; S. F. St. J. Steadman, 4, Sulfolk Street, Pall Mall East, S.W.; L. S. Robertson, 28, Victoria Street, S.W.; Candil, 11, Park Lane, W.; and C. Hage, Stockholmsgade 43, Copenhagen, Demark. So long as C. Hage, or his personal representative, and the company and the tontinentale Syndikat for Poulsen Radio-Telegrafi Aktieselskab, and their original nominees or their personal representatives respectively, hold at least 100,000 shares, the said C. Hage and the said company and the survivor of them shall be entitled to two nominees on the board, and so long as they hold less than 100,000, but not less than 50,000 shares, the shall be entitled to non nominee on the board, Remuneration of directors, 200 each per annum (Chairman, £3

British Bachelet Ordnance Co., Ltd. (140,484).—Registered May 28th, by Ray, Jackman & Falck, 58, Margaret Street, W. Capital, 59,000 in £1 shares. Objects: to carry on the business of manufacturers of and dealers in ordnance of all kinds for naval or military use, machinery, engines, apparatus and accessories, ironmasters, steel makers and converters, colliery proprietors, coke manufacturers, miners, smelters, engineers, metal founders, electricians, electric, magnetic, galvanic and general engineers and contractors, generators and storers of electricity, etc., and to adopt an agreement with C. R. Howes, of 42, Piccadilly, W. The signatories (with one share each) are: H. G. Barrett, Mill Land, Clayton, Sussex, gentleman; T. W. Tagg, 10, Tressillian Road, Brockley, S.E., accountant; L. H. Falck, 58, Margaret Street, W., solicitor; B. A. Cole, Oaklands, Bolton Road, Harrow, clerk; H. Crosland, Woodhurst, Crawley, Sussex, gentleman; C. Vane, 54, Bernard Street, Russell Square, W.C., gentleman. Minimum cash subscription, seven shares. The first directors (to number not less than three or more than seven) are to be appointed by the signatories. Qualification, £5. Remuneration, 10 per cent, of the profits available for distribution, divisible. Secretary: W. E. Newell, Registered office: 166, Piccadilly, W.

Registered office: 166, Piccadilly, W.

Semple and Co., Ltd. (9,402).—This company was registered in Edinburgh on May 28th, with a capital of £1,000 in £1 shares, to acquire the business of electrical and mechanical engineers carried on by Serple & Co., 170, Hope Street, Glasgow. The subscribers (with one share each) are: R. Semple, Jun., Braehead House, Johnstone, mechanical engineer; J. H. Ballantyne, 49, Polwarth Gardens, Glasgow, civil engineer. Private company. The number of directors is not to be less than two or more than seven. The first are R. Semple and J. H. Ballantyne. Qualification, 100 ordinary shares. Remuneration, £10 per annum. Registered office: 170, Hope Street, Glasgow.

Remuneration, £10 per annum. Registered office: 170, Hope Street, Glasgow.

Mico, Ltd. (140,440).—This company was registered on May 22nd, with a capital of £500 in £1 sharps, to carry on the business of manufacturers of and dealers in accumulators lamps, batteries, magnetos and electrical apparatus and fittings of all kinds, motor components and accessories, etc. The subscribers are: Mrs. W. H. Hawdon, Yetholm, Elmfield Gardens, Gcsforth, 250 shares; J. W. Cook, 57, Norfolk Road, Byker, Newcastle-on-Tyne, accumulator maker, 5 shares; C. F. H. Foster, 24, Beaconsfield Road, Sicke, Coventry, magneto expert, 10 shares. Private company. The number of directors is not to be less than two or more than five. Mrs. W. H. Hawdon is permanent managing director. Solicitor: C. Crowther, 23, Abingdon Street, Westminster.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Cryselco, Ltd.—A memorandum of satisfaction in full on May 19th, 1915, of trust deed dated May 6th, 1910, securing £7,500 first and £7,500 second debenture stock, has been filed.

Trust deed, dated May 20th, 1915, to secure £10,000 debenture stock, charged on Kempston Ironworks, Kempston, Bedfordshire, and company's undertaking and property, present and future, including uncalled capital. Trustees: H. S. Deacon, Kempston, Bedfordshire, and A. Baker, Billiter House, Billiter Street, E.C.

Rawlings Bros., Ltd.—Issue, on May 20th, 1915, of £500 bentures, part of a series of which particulars have already been filed.

Midget Lamp Co., Ltd.—Particulars of £400 second and £1,000 third debentures, created April 8th, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £400 and £500 respectively. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

James Keith and Blackman Co., Ltd.—Issue, on May 11th, 1915, of £1,000 debentures, part of a series of which particulars have already been filed. Memorandum of satisfaction in full of debentures, dated October 29th, 1901, and February 9th, 1914, securing £1,000 also notified.

Electrical Distribution of Yorkshire, Ltd. (84,972).— Capital, £50,000 in £1 shares. Return dated March 9th, 1915. 37,500 shares taken up; £36,737 10s. paid, leaving £762 10s. in arrears. Mortgages and charges: £5,000.

Bromley (Kent) Electric Light and Power Co., Ltd. (54,127).—Capital, £100,000 in £5 shares. Return dated April 26th, 1915. 15,000 shares taken up; £75,000 paid. Mortgages and charges: £65,003 4½ per cent, debenture stock.

City of London Electric Lighting Co., Ltd. (34,406).—Capital, £1,200,000 in £10 shares (80,000 ordinary and 40,000 preferred). Return dated March 3th, 1915. 70,595 ordinary and 40,000 preferred shares taken up; £1,105,950 paid. Mortgages and charges: £800,000.

Telephone Co. of Egypt, Ltd. (17,824).—Capital £200,000, 36,000 preferred and 4,000 deferred shares of £5 each. Return dated April th. 1915. All shares taken up. £5 per share called up on 24,000 preferred; 120,000 paid; £80,000 considered as paid on 12,000 preferred and 4,000 derred. Mortgages and charges: £184,251.

Chelsea Electricity Supply Co., Ltd. (20,468).—Capital £400,000, in 74,000 ordinary and 6,000 preferred shares of £5 each. Return dated March 25th, 1915. 49,436 ordinary and 6,000 preferred shares taken up. £5 per share called up on 37,770 ordinary and 6,000 preferred; £218,850 paid; £58,330 considered as paid on 11,666 ordinary. Mortgages and charges: £175,000 debenture stock.

Northampton Electric Light and Power Co., Ltd. (28,640).

Capital £150,000, in 10 "A" and 149,990 "B" shares of £1 each. Return dated March 11th, 1915. 10 "A," 78,500 "B" ordinary, and 31,490 "B" preference shares taken up; £110,000 paid. Mortgages and charges: £58,165.

## CITY NOTES.

## Anglo-Argentine Tramways Co., Ltd.

Mr. J. B. Concannon presided at the annual meeting, held at Winchester House, E.C., on May 27th. He said it was hardly necessary for him to detail the reasons for the set-back which the accounts rangeled. They was all familiar with the accounts are president with the second set of the set-back which necessary for him to detail the reasons for the set-back which the accounts revealed. They were all familiar with the conditions which prevailed in the Argentine both before and since the war. Whilst the total receipts for the year under review as compared with those of 1913 showed a decrease of £112,196, the net profits declined £24,032 only, thanks to the reduction in working expenses, due mainly to the heavy expenditure upon maintenance in the years 1911, 1912 and 1913,

which resulted in the permanent way, rolling stock, etc., being put in good order, and thereby allowing a substantial reduction to be made under this head in 1914. On the other hand, the debenture charges and interest on temporary loans showed an increase of £123,237, after allowing for interest for works in course of construction charged to capital. The working of the first section of the subway lines had helped materially to reduce the loss from the surface lines during the past and current years. The work of constructing the second subway section had been suspended, the Municipal authorities having met them very handsomely in this respect by sanctioning the postponement of the commencement of the work for one year after the termination of the war. Their investments at cost showed a depreciation of £47,378 on the basis of the estimated market values of December 31st last. The reserve fund of £75,145 was available to meet this deficiency, but (following the precedent of kindred companies) they had not thought it advisable at present to take any action in the matter. During the continuance of the war it was impossible to estimate correctly the value of the investments. They would notice the item of £22,810 in the balance sheet under the heading of deposits with contractors abroad. This represented cash paid on account of cars, etc., ordered from Continental firms which had not been delivered, and pending the termination of the war the matter must be left in suspense. The gross decrease in traffic receipts for the four months ending April 30th last was £92,482, and the net profit showed a reduction of £43,287. Having regard to all the circumstances of the moment, they thought it prudent to carry forward the balance of £96,408 remaining at the credit of net revenue account after payment of all charges and preference dividend. As for the future, he would not attempt to prophesy. They all knew how dependent the Argentine was on good crops and stock-raising. The immediate outlook seemed favourable, as the wheat and which resulted in the permanent way, rolling stock, etc., being put in good order, and thereby allowing a substantial reduction to be made under this head in 1914. On the other hand, the

adopted without discussion.

## United River Plate Telephone Co., Ltd.

THE annual meeting was held on May 27th at Winchester Liouse, E.C., Mr. George Franklin presiding. The Chairman, after referring with regret to the death of Mr. David Smith (managing director), said that notwithstanding the general conditions in Argentina, which had been affected by the war, the gross earnings and the net profit were substantially the same for the past two years. The gross earnings for 1914 amounted to £630,651, as compared with £611,657 in 1913, while the gross maintenance and other charges had amounted amounted to £630.651, as compared with £611,657 in 1913, while the gross maintenance and other charges had amounted to £468.846, as against £447,604. The profit for the year was £161.805, as compared with £164,052—a decrease of £2,247, which, under the circumstances, might be considered satisfactory. Included in the expenses were the customary provisions for the maintenance and renewal of plant, on which £129.803 was expended last year, an increase of £23,965 over the previous year. The capital expenditure for the year had absorbed £185,065, of which £70,206 was on account of underground plant, as compared with £364,304 in 1913. On real estate they had expended £46,605 last year, as against £24,671 in 1913. That was following out their policy of substituting underground for overhead plant, and of purchasing land and buildings in which their exchanges were erected instead of In 1913. That was following out their policy of substituting underground for overhead plant, and of purchasing land and buildings in which their exchanges were erected instead of having to rely upon tenancies. The reserve for renewal of plant now amounted to £512,535, and that, with the reserve fund account which, after this year's appropriation, would amount to £316,138—formed, in the opinion of the board, an adequate reserve for any wastage likely to occur on the capital expenditure in the Argentine, which now amounted to £2,390,820. The reduction in the capital expenditure last year reflected the policy of the board due to the outbreak of war, because, apart from the fact that the growth of the company's system did not require the extra outlay, they felt that, consistent with business prudence, it was necessary to himit capital expenditure at the present time to the smallest possible amount. The stock of materials stood at £165,474, a reduction during the year of £37,689—a satisfactory feature, as it was mainfest that materials on the other side were liable to depreciation. The growth of the business as indicated in the number of subscribers showed, for the first time in the company's history, no increase during the year. That indicated the gravity of the crisis through which Argentina had passed, but it had enabled them to postpone with greater ease the provision of new buildings and the exection of explanges. The but it had enabled them to postpone with greater ease the provision of new buildings and the erection of exchanges. The stagnation was only temporary and due to abnormal causes, and while it was impossible to prophesy as to the future they must remember that so far America had escaped the most

baneful consequences of the war. The Municipality of Buencs Aires had granted them a new concession on satisfactory terms, under which they were allowed to extend their underground system and put down subways. In Cordoba they now had an excellent automatic system established, and last January they put into service a 5,000-line automatic system at Rosano. During the coming year Argentina should, he thought, show a fair measure of prosperity, and that in its turn should be reflected in the company's business.

Sir F. Green seconded the motion which, after a short discussion, was adopted.

cussion, was adopted.

## Lancashire Power Construction Co., Ltd.

In their report for the year ended March 31st, 1915, the directors say that during the period the company completed its contract with the Parliamentary Company for the extension of the power station and plant. The balance of profit due thereon, amounting to £1,864, has been brought into the account. The trading profit of the Lancashire Electric Power Co. for 1914 amounted to £29,961, plus interest on hire-purchase plants, etc., amounting to £511, making £30,471, compared with £23,526 for 1913. The balance brought forward from 1913 was £419. Debenture interest has absorbed £4,500, reserve fund £10,000, a dividend of 3 per cent. £12,969, leaving £3,422 to be carried forward. The following figures indicate the development of the company's business:—

					1912.	1913.	1914
Units generated				•••	23,110,807	25,191,442	32,157,185
Max, load in KW.				• • •	6,730	9,720	10,210
H.P. connected	•	· · · •			16,400	23,900	27,018
Receipts			•		£.42,773	₹.54.515	₹,65,433
Expenditure					2,28,156	£31,730	7.35,472
Profit on trading				•.•	7.14.617	7:22.785	7:29.961

It will be observed that, while the dividend and the amount set aside for reserve have been maintained on the same basis as for 1913, the amount carried forward has been increased by £3,000. The revenue account of the Lancashire Power Construction Co., Ltd., shows that the total receipts for the year ended March 31st, 1915, amount to £19,344, and after deducting the expenditure, £17,110, the available balance of £2,224 is to be carried to reserve account.

Annual meeting, June 10th.

## Electric Construction ('o., Ltd.

Electric Construction (°c., Ltd.)

Mr. P. E. Beechcroft presided at Winchester House, E.C., on May 27th, at the annual meeting. He said that the forcast he made at the last general meeting had been justified, and they were able to submit results that day with which he was sure they were satisfied. The gross profit on manufacturing and contracting amounted to £71,989, an increase of 4.2 per cent. This increase might appear somewhat small, but he would remind them that since 1911 they had recorded substantial improvements year by year from manufacturing and contracting, as the following figures proved:—1910-11, £47,800; 1911-12, £53,700; 1912-13, £62,600; 1913-14, for ten months £57,500—per annum, £69,000; 1914-15, £72,600. In five years, therefore, they had increased their gross profit by more than 50 per cent., and, given ordinarily good times, they did not think they had reached their maximum. The comparatively lower rate of increase last year, however, was affected by the exceptional conditions under which they (in common with all manufacturers) had had to carry on operations. Since the outbreak of war they had suffered from a scarcity of labour, no less than 30 per cent. of their workmen of Eligible age having joined the Forces. Great delay had occurred also in obtaining delivery of certain classes of raw material, while the demand for prount delivery of their products had been insistent, necessitating a considerable amount of overtime. Concurrently, the prices of raw materials (which were almost exclusively manufactured articles) had risen steadily since war was declared, but as they had a considerable amount of orders booked on the old basis they were unable to obtain the benefit of higher prices for their products until the financial year was well advanced. It must not be assumed that the receipt of Government or war orders necessarily meant larger additional profits out of proportion to those accruing to ordinary business; such was not so, at least in their case. Orders had been entrusted to them directl MR. P. E. BEECHCROFT presided at Winchester House, E.C.,

cent. per annum, but the increase had been counteracted by lower cost of maintenance of plant and buildings. The total expenditure, therefore, showed no increase, and the whole imexpenditure, therefore, showed no increase, and the whole improvement of £3,000 in gross profit was available for distribution. Having given the comparative gross profit for the past five years, he gave the net profits for the same period:—1910-11, £15,000; 1911-12, £20,300; 1912-13, £27,500; 1913-14, for ten months, £27,000=per annum £32,400; 1914-15, £35,500. These showed that since the increased demand for electrical machinery set in a very large proportion of the increased gross profit had become available for distribution. In other words, the increase in standing charges on the bigger volume of business had been inappreciable. The past year had to some extent benefited in this respect by the extension which had been made to their main factory, and which had materially reduced the cost of handling, in addition to enlarging the out facilities. It might have occurred to some of them that the Board had been ultra-conservative in recommending a some extent benefited in this respect by the extension which had been made to their main factory, and which had materially reduced the cost of handling, in addition to enlarging the output facilities. It might have occurred to some of them that the Board had been ultra-conservative in recommending a dividend of only 6 per cent, on the ordinary shares. In normal times they would have been justified in recommending a larger dividend, but they came to the conclusion that, having regard to all the uncertainties produced by the deplorable war which the nation was now waging, they would be consulting the best interests of the shareholders if they only paid the same rate as last year. The only item in the balance sheet calling for comment was "shares in other companies." This asset was almost entirely represented by their holding in the Electrical Power Storage Co., Ltd., and it had now been written down to what was considered to be the realisable value. An extraordinary general meeting of that company was to be held on June 3rd to consider and, it thought fit, to pass a special resolution for amalgamation with Pritchetts & Gold. Ltd. If the provisional scheme of amalgamation was approved by both companies, the manufacturing operations of the Electrical Power Storage Co. would be transferred to Dagenham, and the economies which would be effected thereby would enable a good dividend to be earned upon the reduced value of the shares. He admitted that they had dealt with the item drastically, but they were now in the happy position of being able to say that every item in the balance sheet stood (subject to what he said last year about the properties, patents and goodwill) at its realisable value or less, every item of a doubtful character having been fully reserved or written down. To enable them to write down the shares in other companies, they had had to transfer £39,403 from general reserve fund £36,000. If they continued to make substantial contributions to general reserve, though not necessarily to the same extent a

Prospectuses .- South Metropolitan Electric Light and Prospectuses.—South Metropolitan Electric Light and Power Co., Ltd.—This company has been offering to holders of its shares and debenture stock a further £25,000 of 4½ per cent. first mortgage debenture stock at £95 per cent. and 25,000 6 per cent. cumulative second preference shares of £1 each at par. A commission of £1 per cent. is payable on the debenture stock and of 1s. per share on the preference shares, making the net cost to the subscriber £94 for the debentures and 19s. for the preference shares. The debentures are repayable at par in 1931. The prospectus states that the dividend on the preference shares is covered more than three times over. The money is required to meet the more than three times over. The money is required to meet the continuous increase in the business.

The Cornwall Electric Power Co. is offering for subscription £60,000 5 per cent. debenture stock at 95 per cent.

Shropshire, Worcestershire and Staffordshire Electric Power Co.—The report states (according to the Financier) that the net revenue for 1914 amounted to £25,366. After deducting expenses, including £250 written off cost of electric lighting orders the directors propose to add to reserve £4,500, to pay a dividend at the rate of 3 per cent. per annum and to carry forward £899.

Banbury and District Electric Supply Co., Ltd. Banbury and District Electric Supply Co., Ltd.—The report adopted at the annual meeting held on Monday at Electrical Federation Building showed that the number of consumers had increased from 312 to 353, but the number of units sold decreased from 607,447 to 547,439, due to the effect of the war on the business of the district. The revenue was £4,255, and the working expenses were £2,448. After paying debenture interest, putting £600 to renewals, £104 to sinking fund for redemption of debentures, and paying 2½ per cent. on the ordinary shares, £319 is to be carried forward.

Worcester Electric Traction Co., Ltd.—The report submitted at the annual meeting held at Electrical Federation Offices, Kingsway, on Monday, showed that the revenue was £18,525 for 1914, as compared with £18,071 for 1913. After deducting expenses chargeable to revenue, including £1,738 for renewals, £4,432 remains. After putting £1,000 to reserve, and paying 3½ per cent, on the ordinary shares, £293 is to be carried forward. The company has sold its motor-omnibus interests to the Worcestershire Motor Transport Co., Ltd., and now holds 8,238 £1 shares out of 19,347 shares issued. 8,238 £1 shares out of 19,347 shares issued.

Petters, Ltd.—Dividend on the ordinary shares for 1914, at the rate of 5 per cent. per annum, as compared with 10 per cent. for 1913. £2,000 is carried to reserve, and £5,000 to meet war losses.

Brazilian Traction, Light and Power Co., Ltd.-A dividend of 1½ per cent. for the three months ending June 30th, 1915, on the 6 per cent. cumulative preference shares, is announced.

Ruston, Proctor & Co., Ltd. — Dividend on the ordinary shares for 1914 7 per cent. per annum, carrying to special reserve for contingencies arising out of the war £25,000, and carrying forward £13,353.

Canadian General Electric Co., Ltd.—A quarterly dividend of 12 per cent. for the three months to the 30th inst. on the common stock is announced.

Stock Exchange Notice,—The Committee has ordered the following to be officially quoted :-

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Further issue of 60,179 ordinary shares of £1 each, fully paid, Nos. 737,501 to 797,679% and 224,882,5 per cent. preference shares of £1 each, fully paid, Nos. 687,501 to 912,382.

Mackay Companies.—The regular quarterly dividend on the common shares of 11 per cent, is announced.

## STOCKS AND SHARES.

Tuesday Evening.

Business in the Stock Exchange continues to plod along quietly. Chief among the themes of discussion is the air raid, of the early part of the week, which took place in the "outlying districts" of London. Although these visitations are becoming sufficiently frequent to make members already somewhat blasc, a very different effect has been the stimulus given to recruiting and to underwriting policies. Investment markets are somewhat heavy. A substantial second edition of the War Loan is expected to be made before long, and, pending its arrival, investors in gilt-edged stocks are inclined to hold their hands. It is still remarkable, however, to observe the difficulty that exists in obtaining such first-class shares as those, for instance, of the good electricity supply companies.

An interesting newcomer of the week, the South Metropolitan Electric Light and Power Company provides. This takes the shape of £25,000 4½ per cent. first mortgage debenture stock offered at 95, and 25,000 6 per cent. cumulative second preference shares at £1. As no part of the issue is underwritten, applicants for the debenture stock get it 1 per cent. cheaper, and the preference shares are applied to be recharded as a supplicant of the supplicants of the debenture stock get it 1 per cent. cheaper, and the preference shares are applied to 1 and 25 out 1 are characteristics.

preference shares at £1. As no part of the issue is underwritten, applicants for the debenture stock get it 1 per cent. cheaper, and the preference shares are subject to 1s. per share discount, making the nett cost 94 for the debenture stock, and 19s. per share for the preference. The prospectus shows the interest on the debenture stock and the dividend on the preference shares to be well covered, according to the profits of the past two years. The stock is repayable at par on July 1st, 1931, or earlier, at the company's option, on six months' notice, at 110. The existing shares were last done at 19s. 9d., and the company's 7 per cent. preference at £3s. 1½d. No transaction has been recorded in the debenture stock since the Stock Exchange respend at the beginning of January; the price at the end of July, on the eye of the war's outbreak, was 98½. City of London debenture is a point or two lower, and falls of 10s. have taken place in London Electric and St. James' ordinary. Counties fell ½ to 11¾, and London Electric preference weakened to 5 sellers.

ened to 5 sellers.

ened to 5 sellers.

Electric Constructions at 13s. are ex dividend, and so are the preference at 1. Babcock & Wilcox are 1s. easier at 2½, and Callenders shed part of their rise of last week. The nanufacturing group as a whole is very steady.

Amongst Home Railway stocks, a dwindling tendency is again marked. Underground Electric issues have given way, the income bonds at 76½ being 2½ down, while the 1s. shares are a

few pence lower. Central London ordinary has failed to maintain the strong front hitherto presented; there is a little stock on offer, and the price has fallen 3 to 77. The 4 per cent. guaranoffer, and the price has fallen 3 to 77. The 4 per cent. guaranteed preferred ordinary remains at 80, and the deferred is about the same price as the ordinary stock. East London changes hands infrequently on the basis of 41, and a bargain has been lately marked in the 4 per cent. "A" debenture stock at 90. Metropolitan Surplus Land is in some demand around 541, and the company's ordinary stock at 29 is one of the few to show an improvement on the week. Various rumours are affoat with reference to the probability that some of the Home Railway companies will be requiring to make fresh issues of capital before the end of the current six months, and two or three of the steam lines have already approached their stockholders with this object.

The unsettlement produced by the tramway strike acts as a

holders with this object.

The unsettlement produced by the tramway strike acts as a depressing factor upon prices. London United Tramways 4 per cent. debenture stock is 50, and no transactions have been recorded in the issues of the Metropolitan Electric Tramways since the middle of last month. Potteries preference were done at 10s. 6d, a few days ago.

Anglo-Argentine Trams are a better market, on the consideration that the passing of the ordinary dividend is really a bull point for the pre-ordinary descriptions, inasmuch as it enables the company to carry forward a largely increased sum to the new year. The first preference shares have recovered to 4½, and the 4 per cent. first debenture stock is 1½ better at 83. Brazilian Tractions dropped to 49 on a shrinkage in the Rio Brazilian Tractions dropped to 49 on a shrinkage in the Rio exchange to the round shilling, but there was a subsequent recovery to 50 on the declaration by the company of its usual quarterly dividend on the preferred shares.

That affairs in Mexico are no better is made evident by a circular just issued by the Board of Trade, in which stress is

circular just issued by the Board of Trade, in which stress is laid upon the huge quantity of paper money now in circulation, some of which there seems every reason to fear will be absolutely valueless when peace comes. "Much of this paper," says the British Vice-Consul at Guaymas, "has been printed and lithographed on such poor paper that it is wearing out, and will disappear or be unredeemable. Moreover, a great deal of counterfeit is in circulation, as well as bank issues without the sanction of such banks." Mexico Tramways common shares changed hands at 30 on Monday, and the second mortgage bonds at 31 two days earlier. In Mexican Light and Power issues the market has come to something like a full-stop for the time being. Auckland Tramways 5 per cent. debenture stock has been done at 101, and Bombay Electrics are firm on the excellent report.

Telegraph and Telephones tend to the duller side, and there are falls in Anglo-American Telegraph preferred, Eastern Extensions, Eastern ordinary and Perference, Globe preference, Western ordinary, and West India and Panama. There is no particular pressure to sell, and the dulness arises from

is no particular pressure to sell, and the dulness arises from the lack of buyers to take what small amount of stock executors of deceased accounts would like to place. Great Northerns rose £1 to 31, and New York Telephone bonds have started to recover. Marconi shares keep very firm, the ordinary being a shade better at 34s., while Canadians are 5s. and

Americans 10s.

The Canadian General Electric Company has declared its regular quarterly dividend of 13 per cent, on the common stock, which has had the effect of stiffening the price to 921; while for the preferred there are still buyers in the neighbourhood of 108. Stock and shares in companies connected with Canada have been somewhat dull on the whole, in sympathy with the weakness of American securities engendered by the

nood of 108. Stock and shares in companies connected with Canada have been somewhat dull on the whole, in sympathy with the weakness of American securities engendered by the renewal of the impression that, unless Germany provides the United States with a much more satisfactory answer to President Wilson's demands than that already formulated. America may find herself face to face with the prospect of war. The Consolidated Gas, Electric Light & Power Company, of Baltimore, is another which has declared its regular dividend of 14 per cent. on the common stock.

Reuter's Telegram Company's report breathes the hope that the State will recognise the sacrifices entailed upon the undertaking by reason of the war, which brought about Government interference with the business. Reuter's Bank passed its dividend, so that the £15,000 provided from this source last eyer is missing in the current report. The net profits of £5,900 are about one-sixth of those for 1913; and the company, as already notified, has passed its own dividend. The occasion has been taken, however, of writing off the goodwill account and making substantial allowance for depreciation of investments, including the holding in Reuter's Bank shares. The nominal quotation for the Telegram Company's shares is 4½, but there is next to nothing doing in them, and to get a bid for the shares is naturally difficult.

The Rubber market shaws a good deal of ferences in con-

but there is next to nothing doing in them, and to get a bid for the shares is naturally difficult.

The Rubber market shows a good deal of firmness, in consequence of good reports recently issued by some of the companies whose shares stand at low prices. These reports can as a pleasant surprise to the market, and, as a favourable influence, served to counteract a trifling decline in the price of the raw stuff. The Armament group is somewhat harder than it was last week. Northern Stock Exchanges, however, are doing so little in their popular shares that London is not disposed to initiate fresh activity in them. The Copper group is supported on the one hand by the firmness of the Paris Bourse, and inclined on the other hand to reflect the dulness apparent in most American securities for the reason already mentioned. The net result of these conflicting currents is that business has shrunk to an exceedingly low ebb.

^{*} Allowance made for dividends being paid free of income-tax.

Hong-Kong Tramway Co., Ltd. — After charging £6,530 for depreciation and providing for debenture interest, and including £7,479 brought forward, the net profits for 1914 were £17,022. A dividend of 10 per cent. is proposed, writing £2,000 off properties, and leaving £6,897 to be carried forward.— Financier.

#### METAL MARKET.

## Fluctuations in May.

The Glasgow Iron Market was closed on May 8rd and 18th,

Russian Electrical Industry: German Control.-A Petrograd paper quotes from an address delivered by V. A. Kieselisff to the Technical Society, Petrograd, on the organisation of the German electrotechnical industry, and the possible results for the Russian electrotechnical industry. He observed that in 1903 there were seven large electrical concerns in Garmany which were both producers and consumers of electrical energy. Taking advantage of the support of the banking houses, which promptly recognised the importance of this branch of industry, these concarns made rapid progress. However, after the crisis of 1904-5 the larger concerns absorbed the smaller ones, so that there remained two—the Siemens-Schuckert and the General Electricity With the advantage of their powers of extense providing Co. With the advantage of their power of extreme specialisa-tion, the great extent of their production and their immense resources, these two companies cover nearly the whole world with a system of electrotechnical concerns which they finance and con-trol. Thus the General Electricity Co. is interested in several electrol. Thus the General Electricity Co. is interested in several electrotechnical concerns, the nominal capital of which reaches the colossal figure of 2,000,000,000 marks. Not content with their rôle as producers of electrical energy, these companies soon get into their hands the production of all manner of electrical equipment, and rapidly destroy all competition in respect thereto. At the present moment these two companies, as a fact, hold in their hands the entire electrotechnical industry of Russia. In some form or other they control all branches of production of installation materials in Russia. Some houses that have been nominally considered to be Swiss, Belgian, or French, are upheld really by German capital for the most part. But how is the electrotechnical industry of Russia to extricate itself from this abnormal situation? The lecturer said that the proposition of many to increase the Customs tariff would not serve at all tion of many to increase the Customs tariff would not serve at to increase the Russian production, but would rather strengthen still further the German concerns operating in Russia. He considered that the only way out was the formation of a great financial organisation—an "Electrobank"—with plenty of money, which would enable the young Russian electrotechnical industry to compete with German capital. Such a bank with entire absence of visit as the electrotechnical industry was executed. of risk, as the electrotechnical industry was essentially progressive, judged by German experience, would attract much money, and make it possible for the Russian electrotechnical industry to emerge from Garman control. The meeting generally agreed with the lecturer, but some of the audience held that the lack of experienced workmen in the country, and the unsatisfactory position of this industry in the schools, necessitated the adoption of corresponding measures for the rectification of these drawbacks.

#### ELECTRIC POWER IN INDIA.

By H. R. SPEYER, A.M.I.E.E.

(Concluded from page 775.)

The fact of many of the pioneering electric power installations in India not proving so successful as anticipated has in many cases turned the owners of mills, factories and collieries against the use of electric power for industrial purposes, and although to day this feeling has to a great extent been overcome, it is still a matter of considerable difficulty to convince owners and others that, apart from the saving in capital outlay and running expenses, inherent advantages appertain to the electrical drive which are not possible of achievement with steam.

In textile mills the steady and uniform speed results without

In textile mills the steady and uniform speed results without doubt in a better quality texture, and the output over the same running hours is materially increased to an extent depending upon the careful lay-out of the machinery, but unfortunately in upon the careful lay-out of the machinery, but unfortunately in very few cases, if any, are manufacturers prepared to guarantee these results. Although they are convinced in their own mind that such is the case, it is rarely that one is able to induce manufacturers to convert their beliefs into written guaranteed percentages, which is really the only basis on which it is possible for laymen to base the value of a conversion from steam, which may have done well for 25 years, to electric power. The approximate coal consumption of the mills and factories in Iudia in 1911 was 1,460,000 tons, and the approximate horse-power available for electrification was 250,000 I.H.P.

The lay-out of a mill or factory to operate successfully in India

The lay-out of a mill or factory to operate successfully in India cannot be designed to the best advantage at home, for in each case local conditions and the topographical position of the site must be taken into consideration. Experience has shown that many drives, which have proved eminently successful at home, have not given the best results in India. During the rainy season the average textile mill, after having been shut down on the Saturday afternoon, requires approximately double the amount of power to get under way on the following Monday morning, owing to the abnormal humidity causing the rope drives to tighten during the interval. It is, therefore, advisable when designing an electric drive with either ropes or belts to allow for the starting gear having an overload capacity of 80 to 100 per cent. Experience has shown that whilst in the majority of cases three-phase induction motors are quite capable of dealing with this temporary overload the capacity of the starting gear has been quite inadequate.

The advisability or otherwise, viewed from the manufacturers point of view, of taking a supply of electrical energy from a public local conditions and the topographical position of the site must be

point of view, of taking a supply of electrical energy from a public company in preference to generating current on the premises, is being keenly contested at the present moment in one of the largest

industrial centres of India.

There is, however, little doubt that for small outputs up to 1,000 m.P. it is far more economical for consumers to take a supply from a local company; but in the case of 15,000 H.P. or more for a 10-12-hour daily load throughout the year, manufacturers realise that with equal facilities for an adequate supply of water for condensing purposes and equal rates for coal, they are in a position to generate electric power as cheaply as a public supply company.

It appears a matter of difficulty to convince manufacturers of the fact that the current supplied by the company represents effective power, whereas in generating power on the premises the difference of cost between indicated and actual horse-power—in which must be included such losses as may be occasioned in the boiler and engine house as well as in the main transmission drives

has to be borne by the mill-owner.

In India during nine months of the year a steady power load due to fans is maintained throughout the 24 hours. The peak lighting load is superposed on the fan load, but the resultant station load-factor (defined as the ratio between the mean and the maximum load) may average as high as 65 per cent. It, therefore, becomes a matter of very serious consideration as to whether a very material advantage is to be gained by an Indian public supply company catering for heavy mill loads which will again be superposed on the fan and lighting peak-loads.

It must be remembered that the revenue per unit obtained from the true later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later later

the two latter loads is far in excess of the price which it is possible to charge the mills and factories for a supply in bulk.

If care is not taken to limit the sale of power for such purposer,

the earning capacity per kilowatt installed in the station may easily be decreased to a greater extent than it is possible to reduce the standing charges per unit generated, by the introduction of such loade

The diversity factor obtained with a fan and lighting load is of The diversity ractor obtained with a ran and lighting load is or great advantage to the station, whereas a big power load overlapping the evening peak of the lighting and fan loads may prove the reverse of remunerative, unless the charge for such a power load is saddled with a proportionate charge of the capital expended on general distribution. It would therefore seem necessary for a standing charge to be levied in addition to a rate per unit metered; but the mill of the charge of the capital to the mill of the charge of the capital state. such a method of charging appears inexplicable to the mill-owner, and in many cases it is owing to controversy on this point that mill-owners have installed their own plant. It appears, however, that this basis of charging must be enforced in order to safeguard the interests of the supply companies, as it may happen that through a shortage of raw materials or the excess of produc-

ton over demand, a number of mills may be shut down two or

three days per week over many months of the year.

Detailed data concerning the principal power supply companies in India have been tabulated in Table I.

The largest private generating stations in India are given in

A number of the Indian State-owned railways have now under consideration important projects for the electrification of inter-urban and main lines, and it is quite likely that many such schemes will mature in the near future.

In conclusion, it may be said that the more important manufacturing centres of India to-day are fully alive to the advantages appertaining to the installation of electric plant, but if British manufacturers are desirous of obtaining a fair percentage of this trade it is essential that they should send out to the country their best men, and should endeavour to standardise a special line of machinery suitable for the unfavourable climatic conditions and unakilled treatment to which the machinery is subjected subjected.

Mill-owners, agents and laymen in general must on their part be prepared to lay aside pre-concerted ideas on the electric drive, and endoavour to grasp simple technical facts, whilst engineers must, on the other hand, be prepared to broaden their outlook to embrace not only technical points but elementary commercial factors. In this way the electrical industry in India will prosper to the advantage of both the mill-owner and British electrical manufacturers. electrical manufacturers.

## LOAD FACTOR, OUTPUT AND COST.

BY C. ASHMORE BAKER, A.M.I.R.E.

(Continued from page 777.)

A STUDY of the various items which go to make up the total cost of production indicates that the variations from the mean are frequently so great as to render superfluous any closer approximation than a straight line law connecting the logs of load factor output and cost. In the matters of total working expenses and average price charged, however, the extremes do not vary to such a wife extent from the means, and the author has been tempted in the case of these items to push the approximation a stage further.

If we divide our undertakings into three groups, namely:—

(a) Those whose load factors are 16 ss than 16 per cent.

(b) Those whose load factors are 16 per cent, or under 20 per cent., and

(c) Those whose load factors are 20 per cent. or over. And if for each of these groups we find and plot the K.E. relation as already described, we shall obtain the three dark lines tion as already described, we shall obtain the three dark lines A, B and C, fig. 5. It will be observed that if these lines were projected towards the right they would cross, which means (if the logs of K and E were actually related by a straight-line law) that for very large values of K the cost per unit for high load factors would be greater than the cost per unit for low load factors, which is obviously absurd. It is probable, therefore, that instead of being a straight line, the graphic relation between log E and log K is a curve slightly sagging downwards. is a curve slightly sagging downwards.

If we work out the relation between log log K and log log E for the group of larger towns, as before, we obtain the relation :-

 $\log \log \epsilon = 347 - (\log \log \kappa \times 0.711)$ 

where  $\epsilon$  is the value of  $\, \mathbf{z}_{\! \cdot}$ , corresponding with the mean value of  $\, \lambda \,$ for the undertakings in question

Taking as correct the equation connecting  $\lambda$  and  $\rho$  already obtained, namely, equation (3), where  $\rho=11.8/\lambda$  0.831, E becomes  $\rho \times \epsilon$  ... ... (6)

Similarly for the relation between output, load factor and price:- $\log \log p = 0.289 - (\log \log K \times 1.75)$ 

where p= the average price corresponding with the mean value of  $\lambda$  for the undertakings in question.

In this case  $\log \rho = 1.34 - (\log \lambda \times 1.027)...$ so that the average price charged per unit (of total supply) =  $p = p \times 21^{6}/\lambda 1^{10}$ ? ... ... (9)

Diagram 6 has been prepared from equation 6. The dotted curve in fig. 3 is also derived from equation 6, the full curve being worked out from equation 4; in these two curves the mean variation of  $\lambda$  with K has been taken into account as satisfying the equation  $\lambda = 9 \times K^{0.056}$ .

Fig. 6 should be useful in enabling fairly accurate comparisons to be made between undertakings having wide differences in output

and load factor.

The usual method of taking into account the influence of load factor consists in dividing the total cost of production into "standing" and "running" charges. From the foregoing equations or from their corresponding diagrams we can ascertain wh should be the average working cost for a station of any size and for any load factor under any heading.

Fig. 7 gives a series of curves so calculated for the item s. "total working expenses" for undertakings of various sizes. The equivalents of these curves in practice are usually taken to be straight lines, and they probably would be approximately such for

any given undertaking.

It will be noticed that for values of  $\lambda$  above 10 per cent., they are very flat, and might, between reasonable limits, be replaced by

traight lines without serious error. Straight lines have, in fact, been drawn through points calculated to cut the curves at the ordinates representing  $\lambda=10$  per cent, and 30 per cent, respectively. These lines projected back to zero will give us fairly closely the respective standing and running components of working cost for undertakings of the sizes they represent.

The point of intersection with the zero ordinate is the total

standing cost per kilowatt exclusive of capital charger, and the

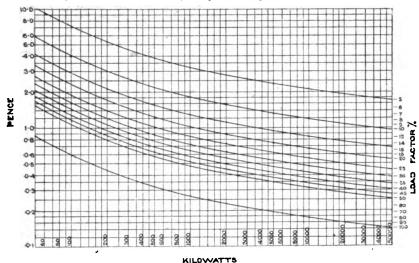

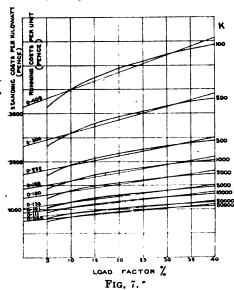

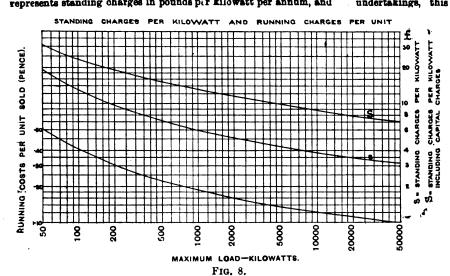

FIG. 6.-TOTAL WORKING EXPENSES PER UNIT SOLD,

slope of the line (that is, the difference between the standing and the total cost at any point divided by the number of units corresponding to the load factor for that point) represents the additional running cost per unit.

It will be noticed that both the standing costs per kilowatt and the running costs per unit vary with the maximum load. Tacse variations are shown in fig. 8, in which the lower curve represents running costs per unit and refers to the left hand scale. It will be noticed that even in quite small undertakings the running cost chould not exceed one third of a penny per unit. The middle curve represents standing charges in pounds per kilowatt per annum, and

refers to the right-hand scale. The upper scale represents the lower curve plus interest and sinking fund at 7½ per cent, on the capital expenditure calculated from curve A, fig. 12.

USE OF THE EQUATIONS IN PRACTICE, INFLUENCE OF LOCALITY.

With a view to applying the standard of comparison afforded by the foregoing equations to various classes of undertakings for the purpose of ascertaining the influence of locality on the cost of production, I have divided the municipal undertakings hitherte considered as a single class into three separate classer, namely :-

(a) 31 Undertakings situated within the area known as Greater London, and as defined by the Metropolitan Police are

various coalfields.

(c) 105 Undertakings situated in other provincial towns scattered throughout the British Isles.

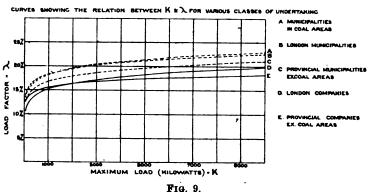

The mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the mathematical countries of the math

The method of comparison is as follows: For each class separately an equation was determined connecting the maximum load  $\kappa$  with the various items of cost. The relation between  $\kappa$  and  $\lambda$  for the class was also determined (fig. 9).

Thus it was possible to plot for each class of undertaking a curve correlating K and each item of cost, and on the same diagram to plot the corresponding standard curve for the same ranges of  $\kappa$  and  $\lambda$ . Here then we have a direct means of com-

LD. parison size for size, and load factor for load factor, of our three classes of undertaking, with the general averages for municipalities throughout the country.

Taking first the London group, we might reasonably expect to find higher working costs under every head of expenditure.

This, however, is noticeably true only for the items "Fuel" and "Management" (which are about 25 per cent. and 50 per cent. respectively in excess of the standard), and "Rent, rates and taxee," which more hereafter.

The other items are in fairly close agreement with the standard

In fig. 10 is given the diagram comparing the total working costs for London municipalities with the standards, the former being shown in full and the latter in dotted lines.

As regards the coal area towns it is not an easy matter without a personal knowledge of each town to decide whether it should be considered as being in a coal area or not, and my classification must, therefore, be considered as purely arbitrary. An interesting hint is given us in fig. 11 however.

Here it will be seen that, although the coal cost per unit is considerably lower than the general average for the smaller.

is considerably lower than the general average for the smaller undertakings, this advantage vanishes when we come to the larger towns, Manchester, Glasgow, Birmingham, &c., from which we may conclude that if we want to obtain the full benefit of cheap coal our power houses must be situated above the workings, not merely among them.

Even a short railway journey such as that from the mining suburb into the big town

puts up the cost of fuel considerably.

Except as regards the rates and taxes, the remaining items of cost, contrary to commonly remaining items of cost, contrary to commonly held ideas on the subject, do not show any marked divergence from the normal. Generally speaking, they are somewhat lower, owing doubtless to the somewhat lower cost and lower standard of living in coal areas, particularly in the smaller towns.

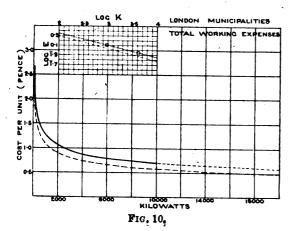

With regard to the curves for the ordinary provincial towns, little need be said except that they are, as was to be expected, markedly

similar to the general average.

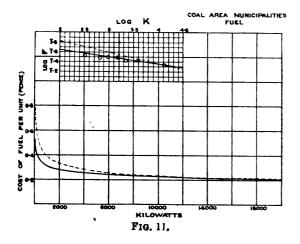

The curves relating to "rent, rates and taxes" for the various groups of local authorities, as also for those of companies, are marked chiefly by anomaly.

Thus, in the case of London local authorities the rate per unit under this head increases as the load increases, and therefore as the average price charged decreases. In the case of the coal area towns also this is true, but to a less extent. In the case of the

ordinary provincial municipalities this item decreases with increased load and with the average price charged. In the case of companies working in ordinary provincial towns the rent,

rates and taxes item also decreases with the average price, but to a greater extent than in the case of the corresponding municipalities, so that the average charge under this head is in this

cipalities, so that the average charge under this head is in this case less for the companies than for local authorities.

With London companies again the "rates, &c." per unit rise with the size of the undertaking as in the case of the municipalities, but the average cost per unit to companies is nearly double that paid by London municipalities.

The whole question is in fact extremely complicated and interesting, and well worth further study, but whether this investigation is properly the function of engineering science or that of the Society for Psychical Research, I do not as yet feel competent to express an opinion. competent to express an opinion.

(To be continued.)

# NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Electrical Tide Gauge.

MESSES, GENT & Co., LTD., of Faraday Works, Leicester, have recently completed an interesting application of their water level indicating apparatus for the purpose of registering the state of tide during the night, in conjunction with certain dredging operations now being undertaken by Messes. Topham Jones and Railton.

Railton.

The apparatus, which is fixed on a timber dolphin about half a mile from the shore, consists of a 25-volt Walker Horrocks automatic electric lighting plant driven by a petrol engine, and having accumulators of 240 ampere-hour capacity for supplying the current to five differently coloured Anchor type lamps.

The mechanism, which is operated by a float fixed in a stand-pipe under the dolphin, consists of a number of switches operated by a lever which is geared to a chain connected with the float, and as the tide rises and falls every 6 in. difference in level causes the switches to operate, and cut in difference in level causes the switches to operate, and cut in difference in level causes the switches to operate, and cut in differences in level from sero to 19 ft. 6 in., and with a spring tide the change of lights takes place approximately every five minutes.

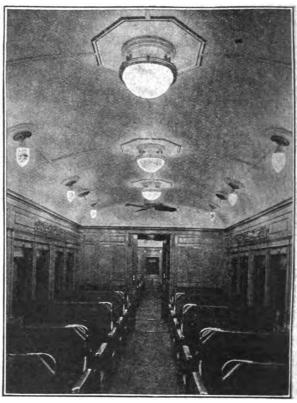

The plant is entirely automatic in working, being self-starting self-regulating, and self-stopping; occasional oiling and

replenishing of fuel only are required. If the engine fails to start, a warning is given by a red light at the side of the engine-house, but the cells will supply light for about four days after this warning has been given. A time switch is used in the circuit to cut off the current during the day time.

### Railway Carriage Lighting.

In view of the great amount of attention that the subject of the correct illumination of railway carriages has recently been receiving at the hands of the illuminating engineers of railway companies and others, the accompanying illustration is of interest.

This railway carriage is one of a large number built by the Metropolitan Carriage, Wagon and Finance Co., Ltd., at Saltley, Birmingham, for the Central Argentine Bailway. The overall dimensions of the carriage are approximately 66 ft.  $\times$  9 ft. It is divided into two compartments, each 25 ft.  $\times$  9 ft., and in

HOLOPHANE LIGHTING IN A RAILWAY CARRIAGE.

each compartment are installed four 12-in. Holophane Reflector bowls (each equipped with two 40-watt lamps) down the centre of the coach, whilst on either side there are four Holophane Pines,

The power provided in this case is very liberal, enabling an illumination intensity of 6 ft.-candles to be obtained uniformly over the whole reading plane. Notwithstanding that the illumination intensity is so high, excellent diffusion and evenness are obtained from the use of the Holophane glassware, whilst glare and shadows are obviated. The carriage has a lively and pleasing appearance when illuminated and the handsome furnishings are appearance when illuminated, and the handsome furnishings are shown up to advantage.

# CORRESPONDENCE.

etters received by us after 0 P.M. UN I DEED TO COMMUNI-the following week. Correspondents should forward their communi-at the earliest vossible moment. No letter can be published Letters received by us after 5 P.M. ON TUESDAY cannot appear until unless we have the writer's name and address in our possession.

## Cab Signalling.
